It is perfectly understandable that the statistical infirmity occasioned by the break in the M_1 series of data, discussed above, left RBI with no option but to adopt M_3 for its analysis and policy purposes as an expediency in the post-1978 phase. At the same time, it is also reasonable to expect RBI to revert to M_1 as soon as the new series of M_1 compiled on the modified basis are available for a period of say a decade. It is perhaps this sort of expectation which explains why the Chakravarty Committee did not deem it necessary to focus on the choice of an appropriate monetary aggregate for monetary policy and planning. Although the committee has not explicitly recommended M_3 as a monetary aggregate to be used for monetary targeting, it would appear from the following paragraph that the committee is inclined towards an M_3 target: "Formulation of monetary policy with M_3 as the monetary variable to be targeted thus becomes a feasible proposition in the restructured monetary system envisaged above" (paragraph 9.85 of the report).

In any case, the dethronement of M_1 and the *exclusive* use of M_3 by RBI for monetary analysis and policy are of such fundamental significance that they need to be discussed more widely. Unfortunately, this aspect of change has not attracted ade-

quate attention of monetary economists in India.

The crucial issue to consider is: in the Indian milieu, which of the two, M_1 and M_3, is of more direct relevance to demand management objectives implicit in monetary targeting? For convenience of reference, it may be mentioned here that narrow money aggregate (M_1) comprises currency with the public, demand deposits with banks, and other deposits with the RBI, Broad money aggregate (M_3) is derived by adding time deposits with banks to M_1.

The Indian milieu can be broadly sketched as follows: The household sector is the generator of the bulk of savings in the economy. The average gross savings rate has remained around 22 per cent of national income for the last three years, the household sector alone accounting for some 15 per cent or about two-thirds of total domestic savings. Again, the share of bank deposits in the gross financial savings of the household sector has shown a secular uptrend, rising sharply from 31.6 per cent in 1968-69 to more than 60 per cent in recent years. As percentage of gross financial savings, household sector deposits with commercial banks have risen from 18 per cent in 1970 to 67.5 per cent in 1987-88. More importantly, the share of time deposits in total deposits of commercial banks is overwhelmingly preponderant: and the strong preference in India for longer maturity deposits is well known. For instance, deposits of five years and above which constituted only 7 per cent of total fixed deposits of scheduled commercial banks in 1970, rose to more than 60 per cent of the total in 1980. The main conclusion that can be drawn from these facts is that in the Indian milieu, time deposits with banks represent the 'abode of saving' rather than the 'abode of purchasing power', and hence this component is hardly relevant to any measures designed to control liquidity or for demand management. The monetary aggregate M_3 is thus ill-suited to be used for monetary targeting.

There is an inherent paradox in the RBI's adoption of M_3 for purposes of monetary targeting: in the present context of monetary policy, a lower M_3 because of the need to contain inflation, and a higher growth rate of time deposits—a component of M_3—because of the need to raise the savings rate are both simultaneously desired objectives!

Viewed in this perspective, it becomes obvious that the M_1 series of data, which steer clear of this problem, is a more appropriate indicator for monetary targeting. The sooner RBI reverts to this series, the better it would be for formulation of more realistic monetary policy.

Indian Milieu for Monetary Analysis

The canvas of the Indian milieu for monetary analysis and policy is much wider than what has been discussed already. The broader canvas raises the basic issue of adopting the conventional concepts in monetary theory to the Indian institutional milieu. In the absence of such adaptation, the dangers of what Amartya Sen calls the "illegitimate application of imported concepts"[8] to policy formulation become imminent. For formulation of policy what is required is an insightful analysis of specific issues rather than a mechanistic application of textbook concepts derived from an alien milieu. This process of adaptation involves a good deal of research into institutions; inter-relationships between prices, output and money; and the transmission mechanisms through which an exogenous change in any one of these three variables may influence the other two. Some essentially Indian phenomena, which form part of the transmission mechanism, need to be absorbed, rather than being unloaded as an inconvenience, in this adaptation process. As illustrative of such phenomena, the following three issues are briefly discussed.

First, reference may be made to what can be termed, in the absence of a better phrase, the quality of money supply expansion. In monetary policy, primary emphasis is usually placed on its role as an instrument of macro-economic demand management. Hence, considerable sanctity is attached to 'monetary targets', or the permissible magnitude of monetary expansion in a given year consistent with the anticipated rates of growth in real income, as well as some broad assumptions regarding price trends. Empirically, it has been concretely demonstrated that in the formulation of monetary policy, one should not be content with only the data relating to the *quantity* of money supply expansion: it is equally essential to take into account the *quality* of money supply expansion. This is because different 'sources'[9] of money supply expansion exert varying degrees of pressures on aggregate demand. For instance, expansion of money supply brought about largely from accretion of foreign exchange reserves is qualitatively quite different from the same rate of expansion which has been caused by purely domestic factors. Though the money supply expansion under two different sets of situation might be of the same magnitude, the two can have very different implications for demand management.

The second phenomenon relates to currency. The estimation of the demand for currency in the Indian economy has been the econometrician's nightmare. This is because there are two special characteristics of the Indian economy—characteristics which the standard texbooks do not discuss. These are public sector procurement and distribution of foodgrains and the drain of cash to the informal sector. With the help of the necessary empirical data, the impact of food procurement operations on the variations in currency has been clearly demonstrated. The net off-take of foodgrains from the public sector stocks thus becomes a crucial variable in the determination of the currency expansion in a given year. Similarly, the import of certain goods like food articles, including edible oil, the import of which has assumed sizeable proportions in more recent years, fertilisers and fuel ("the three F's" as mentioned in one of the articles referred to in note 9), also has important implications for currency expansion. The standard demand for currency functions unfortunately do not capture this important variable.

Yet another important feature of variations in currency is the flow of cash which takes place constantly between the formal and the informal sectors of the economy. The drain of cash away from the banking system, and the return flow of cash to the banking system, the activation of idle cash balances reflecting dishoarding and hoarding of currency—all these are factors relevant in this context. The size of such flows and the circumstances under which activation of idle balances takes place need to be studied in depth. These phenomena may defy precise measurement, but some allowance needs to be made for these factors in any meaningful monetary planning and analysis, particularly for monetary targeting. Since the elegant econometric exercises are unable to capture these phenomena, which are an integral part of the Indian monetary scenario, the actual variations in currency differ widely from forecasts.

Finally, another area which has received inadequate attention is the impact of money on output. Money has an impact on both output and prices. Money is created because credit is extended to the government, the private sector, and/or to the external sector. Since credit facilitates the production process, it has a favourable impact on output. But this impact varies a great deal from sector to sector and from one end-use of credit to another end-use. For instance, crop loans have a direct impact on output and by their very nature are self-liquidating, whereas a term loan given to an industry may have a long gestation period. The inflationary implications of these two categories of credit would be different. What needs to be driven home is that building one omnibus credit ceiling into a specific monetary target is not enough. A disaggregated credit target which takes into account these precise linkages to different economic activities would be necessary, if the basic objective of monetary policy of exploiting fully the growth potential in the economy is to be realised.

Thus, unless the institutional framework and the behavioural characteristics of the specific phenomena which characterise the Indian monetary scenario are built into monetary models, the models, would remain largely academic.

Concluding Observations

Unfortunately, in economics, as in the case of technology, there seems to be some time-lag between the emergence of innovations in theory, concepts and instruments in developed countries and their absorption by the developing world. During a phase when major industrial economies appear to be moving away from reliance on monetary targeting, we have begun to adopt monetary targeting. Fortunately, the modified version

f 'monetary targeting with feedback' eflects the lessons learnt from the ex- erience of developed economies and, to ome extent, adaptation to the specific situa- ion of the Indian economy. But *only* to an xtent, as the earlier discussion made it clear.

In implementing the monetary targets, noreover, the recommendations of the Chakravarty Committee do not seem to have een faithfully followed. First, the monetary argets are not announced publicly but are nade known indirectly in the RBI governor's communication to banks setting out the credit policy measures. Second, the targets are in terms of points, rather than in terms of ranges, as recommended by the Chkravar- ty Committee. Thirdly, there is little evidence to show that the mid-course corrections en- visaged in the so-called 'monetary targeting with feedback' are taking place in practice.

The experience of the two contrasting years—1987-88 which witnessed the worst drought in the century and 1988-89 perhaps the most buoyant year since the inception of planning—shows that monetary targeting is not exactly tuned to the rhythm of economic activities in a given year. The monetary target fixed for 1987-88 towards the end of March 1987 was well below 18.8 per cent of M_3: this target was fixed in anticipation of growth in real income of 5 per cent. The prospects of growth in real income changed dramatically and RBI's revised estimate was only around 2.5 per cent. Eventually, the actual growth turned out to be 3.6 per cent, as the CSO estimates which became available well after the end of the year 1987-88 confirmed. Strangely enough, the fluctuations in the growth prospects did not seem to affect the monetary target. In sharp contrast to the experience in 1987-88, growth in real national income in the year 1988-89 was exceptionally high, the estimates ranging from 9 to 11.5 per cent, and yet the monetary target remained at below 17 per cent. It must be added that the inflation rate at 9.3 per cent remained more or less of the same magnitude in both these years. The point to be driven home is that those who assert that there is a predictable relationship between changes in money supply (M_3) and in real income on the one hand and price level in the other would do well to ponder over the experience during these two years.

This question should not be misconstrued merely as one of seeking a year-to-year correspondence between the relevant variables. Empirically, taking out four-year period from 1975-76 to 1978-79, it has been demonstrated that notwithstanding a very high average rate of monetary expansion (M_1) of 16.4 per cent, and an average growth in real national income of 5.6 per cent, prices displayed a remarkable degree of stability, rising at an average annual rate of only 1.6 per cent.[10] Even in the medium term therefore, to seek a mechanical relationship between money, output, and prices, as most econometric exercises appear to do, is hardly meaningful from the policy point of view.

Overall, the hazardous nature of forecasting real national income growth in a particular year, the critical role played by supply management strategies including public sector procurement and distribution of essential commodities in the process of price determination and the interaction between formal and informal sectors—all these factors warrant that the monetary authority should approach the problem of monetary management in all humility! As I G Patel[11] puts it: "...one should speak of monetary targeting only in a minor key. In fact, strident notes are seldom appropriate when we speak of monetary policy in any case."

What other conclusions could one derive from the foregoing discussions on monetary targeting? A practising economist should be able to grasp simultaneously the dialectics of the purposes of an instrument as indicated in the textbooks as well as the realities of the milieu in which the instrument is sought to be put to use. Looked at from this perspective, one important conclusion is that what can be called 'the indigenous component' of monetary research in India needs to be enlarged: some of the issues on which more work needs to be done have already been identified. Second, M_1 (narrow money) and *not* M_3 (broad money) is a more appropriate indicator of demand and hence monetary targets[12] should be set in terms of M_1. In addition to M_1, there should also be a target for net RBI credit to government. In situations when actual expansion in M_1 far exceeds the targeted range, it should be possible to pinpoint that this was due to fiscal imprudence. If, on the other hand, there is an over-zealous attempt on the part of the RBI to stick to the target, even after accommodating fiscal profligacy, the result may prove counter-productive affecting adversely the productive potential of the economy. The dual targets of M_1 and net RBI creidt to government would be thus more practical. Thirdly, it should be appreciated that overall monetary restraint could co-exist with liberalism towards selected sectors or sub-sectors of the economy. The reference here is to the self-liquidating nature of credit extended to certain sectors: crop loans to agriculture, export credit and asset creating employment projects undertaken in the context of absence of wage-goods constraint—these are instances in point. The precise credit-economic activities linkages need to be studied in depth so that disaggregated credit targets could be built into the overall credit target. An omnibus credit ceiling is much less meaningful.

Finally, the 'ability to nag' the government is traditionally regarded as one of the important weapons of central banks. In the Indian context, in which the whole exercise of monetary targeting is discussed here, one could sum up that monetary targets could be regarded as additions to the kit of such nagging instruments.

Industry-Agriculture Growth Rates: Widening Disparity

An Explanation

B B Bhattacharya
Arup Mitra

This study examines the nature and causes of industrial growth in the face of slow agricultural growth. It is hypothesised that the nature of the agriculture-industry relationship would depend crucially on the relative growth of income and employment in not only the industrial sector but also in the tertiary sector. If income grows faster than employment then it tends to generate more demand for industrial goods vis-a-vis *agricultural goods, and consequently the disparity between industrial and agricultural growth widens.*

I
Introduction

THE agriculture-industry relationship has now become a matter of interest, particularly in the context of recent spurt in industrial growth. Broadly, there are two views on this. First, it is argued that the rise in industrial growth without any increase in agricultural growth can be merely transitory. In the long run, industrial growth would slow down through forward and backward linkages between agriculture and industry. On the other hand it is also argued that with diminishing importance of agriculture in the economy, industry can now expand on its own momentum. The present study examines the nature and causes of industrial growth in the face of slow agricultural growth. Most of the studies on this issue have so far concentrated on the direct inter-linkages operating between the two sectors without any reference to the growth of income and employment in the tertiary sector.

It is hypothesised here that the nature of agriculture-industry relationship would depend crucially on the relative growth of income and employment in not only the industrial sector but also in the tertiary sector. If income grows faster than employment then it tends to generate more demand for industrial goods *vis-a-vis* agricultural goods, and consequently the disparity between industrial and agricultural growth widens. This hypothesis seems to be empirically valid both at state and macro level. We find that growth differentials between industry and agriculture at the state level, during the period 1970-71 to 1980-81, can be adequately explained in terms of growth differentials between income and employment in the non-agricultural sector. The evidence also suggests that at the macro level relatively slow growth of employment in the public sector and almost stagnant employment in organised private sector in the recent period seem to have been mainly responsible for widening disparity between industry and agriculture in the eighties.

The organisation of the paper is as follows. Section II reviews the existing literature on the subject in the Indian context. Section III examines income and employment behaviour in 14 major states during the period 1970-71 to 1980-81. This analysis is confined to seventies only because of lack of census data on employment after 1981. Following this a hypothesis is developed and tested in Section IV to explain the industry agriculture income differentials at the state level. Section V extends this hypothesis at the macro level and explains the pattern of industrial growth in recent years. Finally in Section VI we draw the basic conclusion and its policy implication.

II
Review of the Existing View

The traditional literature on inter-sectoral linkages in the growth process generally emphasises the role of agriculture as a primary supplier of wage goods and raw materials to industry (supply-linkage) on the one hand and as a provider of major output for industrial goods (demand linkage) on the other [Johnston and Mellor, 1961 and Krishna, 1982]. This view however does not explicitly spell out the increasing role of the tertiary sector in a modern economy. Further, it may be noted that with growing mechanisation of agriculture it becomes dependent on industry for basic inputs, like, fertiliser, power, pesticides, etc. Incidentally the agriculture-industry relationship becomes more complicated in this process.

A slow growth of net availability of foodgrains or alternatively the movement of inter-sectoral terms of trade in favour of the agricultural sector is believed to cause deceleration of the industrial sector. However, empirically speaking there was no slow down in the growth of production of foodgrains after the mid-sixties [Ahluwalia: 1985]. Nor was there any fall in the marketed surplus of agriculture [Thamarajakshi: 1977] so as to be related to the industrial deceleration. But, so far as the agriculture *vis-a-vis* industry terms of trade is concerned, one encounters a series of mixed evidence. When Thamarajakshi [1977], and Mitra [1977] visualised a favourable terms of trade for the agricultural sector during the mid-sixties and early seventies, Khalon and Tyagi [1983] obtained evidence that stand quite contrary to others' view. Mundle [1977], however maintains that in terms of intersectoral resource flow—of which terms of trade is just a single component—the industrial sector has been undergoing loss since the mid-sixties. Prior to that it was agriculture which was experiencing an outflow of resources. Rangarajan [1982a] in his macro econometric model makes an attempt to capture the demand linkage between agriculture and industry. He identifies a positive impact that agricultural output has on the demand for industrial consumption goods. The effect of foodgrain terms of trade on industrial products has been negative but elasticity is negligible. Both agricultural output and terms of trade had a positive influence on household saving and investment. Keeping in view such segmented impact of agriculture on industry Rangarajan [1982b] drops the idea of explaining the behaviour of industrial production purely in terms of agricultural performance.

Bhattacharya and Rao [1986] emphasises the sluggishness that continued in the performance of industry even after the relative relaxation of the wage goods constraint that occurred during the green revolution period. In their macro econometric framework the partial elasticity of non-agricultural gross domestic product with respect to agricultural output declined from 0.15 for the pre-green revolution period to 0.03 for the post-green revolution period. Deceleration in public investment in general and acceleration of capital intensive investment in agriculture during the post-green revolution period had adverse implications on employment causing relative deficiency in demand for agricultural products. The decline in the share of agro-based industries coupled with such phenomenon of slow employment growth reducing the demand for agricultural products and wage goods, thus weakened the agriculture-industry relationship.

Therefore, bearing in mind the weak supply linkage between agriculture and industry in Bhattacharya and Rao's study [1986] and the existence of a narrow demand linkage, in Rangarajan's work [1982], bet-

ween agriculture and merely the set of industrial consumption goods like clothing, footwear, sugar and edible oils, it may be concluded that the overall intersectoral linkages appear quite modest. Moreover, green revolution being mostly confined to a few pockets, it was less likely that the post-green revolution period could witness a strong demand linkage if it did not exist earlier.

It is in this context that the demand for industrial products originating not only from within the sector itself, but the large demand potential that the high productivity tertiary sector has, needs to be analysed. Industrialisation, indeed, at its first stage gives rise to demand for a large spectrum of tertiary sector oriented activities [Mills and Becker: 1986]. But it may be argued that at a later stage the sustenance of a high rate of industrial production is subject to the volume of industrial products consumed by the tertiary sector. Even if agriculture is not stagnating, its declining share in total product and the rapidly rising share of the tertiary sector, as it is usually postulated in the process of development, further strengthens the justification of the above proposition. However, needless to add that the pattern of industrialisation will depend upon the specific kind of products demanded by the pattern of income and employment generation in both manufacturing and tertiary sector.

Since agriculture provides basically wage goods the demand for agricultural products in non-agricultural sector would depend not only on the growth of non-agricultural income but also on growth of employment in non-agricultural sector. If income in non-agricultural sector grows faster than employment then the demand for agricultural products grows slower than non-agricultural income and consequently the non-agricultural sector can grow relatively faster than the agricultural sector.

III
Income and Employment Growth Rates

This sector analyses at the state level the income and employment growth rates in different sectors over the period 1970-71 to 1980-81. In our definition agriculture includes forestry and fishing too. In the secondary sector we mainly concentrate on the registered manufacturing sector. The tertiary sector has been split into six categories: (a) Transport, storage and communication, (b) banking and insurance, (c) public administration and defence, (d) trade, hotels and restaurants, (e) real estate, ownership of dwelling and business services, (f) other services. The data for this analysis are mainly drawn from the estimates of domestic product and state domestic product at factor cost by the Central Statistical Organisation (CSO) and the employment estimates by the Population Censuses. It is to be noted that Population Census in 1981 did not report the employment figures corresponding to the registered manufacturing units separately from the unregistered ones as it was reported in 1971 Census in its establishment tables. We have, therefore attempted the following approximation before calculating the state specific employment growth rates in the registered manufacturing over the decade 1971 to 1981. From the total employment in the industry division, manufacturing other than household, we have deducted the single workers and family workers for both the years 1971 and 1981. A 'single worker' in the census is defined as 'one who is doing work without employing others except casually and without the help of other members of his family except casually or a participant in work as a member of a co-operative'. A family worker is 'one who is doing his work in a family enterprise along with other members of the family without wages or salary in cash or kind'. We assume that both these categories of single workers and family workers fall within the unregistered sector in the industry division, manufacturing other than household, and, therefore, these numbers have been netted out from the total employment in this industry division.

The main purpose behind the subclassification of the tertiary sector is to highlight the growth differentials of different components of the tertiary sector. While the segments like banking and insurance and public administration and defence are organised-sector-dominated, trade, hotels, etc, and real estate, etc, mostly fall within the unorganised sector. Within the industry division, transport, storage and communication, railway services, communication, etc, are basically in the organised sector and rest are a combination of both organised and unorganised segments. Similarly, the category of other services can be located in both the sectors.

Table 1 presents average annual growth rates of SDP at factor cost of 14 major states during the period 1970-71 to 1980-81. For comparison we have also provided average annual growth rates of NDP at factor cost during this period. The table reveals that there has been wide differences in growth rates of SDP from agriculture among states. Maharashtra has highest growth rate of 4.6 per cent per annum followed by Punjab (3.7), Karnataka (3.3), Gujarat (3.1), Haryana (2.8) and West Bengal (2.8). Kerala, MP and Tamil Nadu have recorded negative

Table 1: Income Growth Rate during 1970-71 to 1980-81, All India and Individual States

(Per cent pa)

State	Agriculture, Forestry and Fishing	Registered Manufacturing	Tertiary: Transport, Storage, Communication, etc,	Tertiary: Banking and Insurance	Tertiary: Public Administration	Tertiary: Trade Hotels and Restaurants	Tertiary: Real Estates Ownership of Dwelling, Business Services	Tertiary: Other Services	Tertiary: Total Tertiary
Andhra Pradesh	1.47	6.93	5.21	10.52	9.54	3.55	5.70	2.39	4.99
Bihar	0.91	4.07	2.74	6.90	1.22	9.92	−0.15	4.35	5.23
Gujarat	3.09	6.27	7.18	8.32	7.18	5.93	3.25	2.75	5.64
Haryana	2.77	7.93	7.72	10.69	7.71	10.57	4.67	3.40	8.13
Karnataka	3.31	8.65	5.81	8.30	8.76	4.58	3.81	1.68	5.00
Kerala	−0.33	4.67	5.22	8.48	7.41	0.63	3.06	3.59	3.50
Madhya Pradesh	−0.71	5.46	6.05	9.33	7.83	0.36	1.77	5.44	4.37
Maharashtra	4.60	6.67	4.69	5.67	5.08	6.03	3.24	1.98	4.76
Orissa	2.01	8.49	4.01	8.67	3.81	1.95	4.10	3.21	3.33
Punjab	3.65	8.77	6.89	9.58	7.37	7.88	2.14	4.92	7.07
Rajasthan	1.11	3.98	4.67	10.75	7.89	3.13	4.36	4.05	4.61
Tamil Nadu	−0.23	7.24	3.98	6.56	8.71	2.48	3.66	1.70	3.77
Uttar Pradesh	1.80	5.60	5.09	8.22	2.20	3.17	4.38	2.15	3.66
West Bengal	2.76	1.99	3.64	5.65	3.86	2.24	4.63	−0.69	2.77
All India	1.93	4.81	6.42	7.67	7.38	4.80	4.13	2.86	

Note : Growth rates refer to exponential trend growth rates pa.

growth rates. In the case of SDP from registered manufacturing Punjab (8.8 per cent per annum), Karnataka (8.7), Orissa (8.5), Haryana (7.9) and Tamil Nadu (7.2) have performed well above the all India growth rate of 4.8 per cent per annum. Tamil Nadu in particular, and MP and Kerala, have achieved a fairly high growth rate of registered manufacturing output despite a very poor agricultural performance. West Bengal on the other hand has yielded a very low rate of manufacturing output growth rate (2 per cent per annum) in spite of performing relatively better in agriculture (2.8 per cent per annum which is well above the all India growth rate of 1.9 per cent per annum).

In the tertiary sector there is a wide variation in SDP growth rates across states as well as among different types of tertiary activities. In general, the faster growth is recorded in banking and insurance and public administration in all states. In public administration the highest growth rate is achieved by Andhra Pradesh (9.5 per cent per annum) and the lowest by Bihar (1.2 per cent per annum). In transport, storage and communication the growth rate varies between 7.7 per cent per annum for Haryana to 2.7 per cent per annum for Bihar. Gujarat, Punjab and MP have also recorded high growth rate (above 6 per cent) in this activity. In predominantly unorganised tertiary activities—trade, real estate and other services—the growth rates are generally lower than in predominantly organised activities—transport, communication, banking and public administration. In trade the highest growth rate is achieved by Haryana (10.6 per cent per annum) followed by Bihar (9.9) and Punjab (7.9) and the lowest growth rate is achieved by Kerala (0.6) and MP (0.4). In other tertiary sector services West Bengal has performed worst with a negtive growth rate of −0.7 per cent per annum with Punjab performing best with a growth rate of 4.9 per cent per annum.

The overall tertiary sector SDP growth rate has a broad correspondence to registered manufacturing SDP growth rate. The only major exception in this regard is Orissa where the tertiary sector growth rate at 3.3 per cent per annum is well below the registered manufacturing growth rate at 8.5 per cent. In general the growth rate of SDP from tertiary sector is higher than the growth rate of SDP from commodity sector, excluding unregistered manufacturing. This is consistent with the observed pattern of growth elsewhere. The relationships among growth rates of tertiary, agriculture and industry sectors at state level are examined elsewhere [Mitra: 1989].

Table 2 presents average annual growth rate of employment in various sectors during the period 1971 to 1981. In agricultural sector the fastest growth of employment has been recorded in Karnataka (2.7 per cent per annum) followed by Haryana (2.5), Tamil Nadu (2.4), Maharashtra (2.4) and MP (2.3). The all India growth rate of employment in agriculture is 1.9 per cent per annum. Kerala has practically no growth in employment in agriculture. In the registered manufacturing sector the employment growth rate has been very high in Rajasthan (9.3 per cent per annum) and Haryana (8.3) and negative in Kerala (−0.6). The moderately high growth rate is achieved in Gujarat, Orissa, UP and Karnataka. The traditionally industrial states—Maharashtra and West Bengal—have recorded a relatively poor growth rate of employment (3.5 and 3.1 per cent respectively) in registered manufacturing.

In the tertiary sector the employment growth rate is generally lower than that in registered manufacturing sector. Agai within the tertiary sector the employmen growth rate has been faster in trade, trans port, communication and banking and rela tively lower in public administration an defence. Across states, employment in ter tiary sector has grown relatively faster i Haryana, Gujarat, Bihar, MP, Maharashtr Punjab and Rajasthan. Orissa has recorde the fastest employment growth rate in publi administration (4.5 per cent per annum followed by Bihar (2.8), Gujarat (2.9) an West Bengal (2.3). In Kerala employment i public administration has declined.

In the context of agriculture-industry rela tionship it is important to compare not onl relative growth rates of income but als employment elasticity of output. States with relatively lower employment elasticity may have relatively higher growth rate of industry *vis-a-vis* agriculture. Table 3 presents employment elasticity—measured as average annual growth rate of employment divided by average annual growth rate of income—across sectors and across states during the period 1970-71 to 1980-81. In agriculture the employment elasticity has been highly negative in Tamil Nadu (−10.5) and MP (−3.2) and almost negligible in Kerala (−0.03), It may be noted that in all these states the growth rate of SDP from agriculture was negative while growth rate of employment in agriculture was positive. The employment elasticity therefore became negative, which may not be regarded as an evidence of falling employment intensity in agricultural production in these states. On the positive side the highest employment elasticity in agriculture is recorded by Rajasthan (1.8) followed by Bihar (1.4) and Andhra Pradesh (1.4). Punjab has a very low employment elasticity in agriculture (only 0.4) followed by Maharashtra (0.5) and Gu-

TABLE 2: EMPLOYMENT GROWTH RATE DURING 1971 TO 1981, ALL INDIA AND INDIVIDUAL STATES

(Per cent pa)

State	Agriculture, Cultivation, Livestock, etc,	Registered Manufacturing	Tertiary: Transport, Storage, Communication, etc	Tertiary: Banking and Insurance	Tertiary: Public Administration	Tertiary: Wholesale and Retail Trade, etc	Tertiary: Real Estates, Ownership, and Business Services	Tertiary: Other Services	Tertiary: Total Tertiary

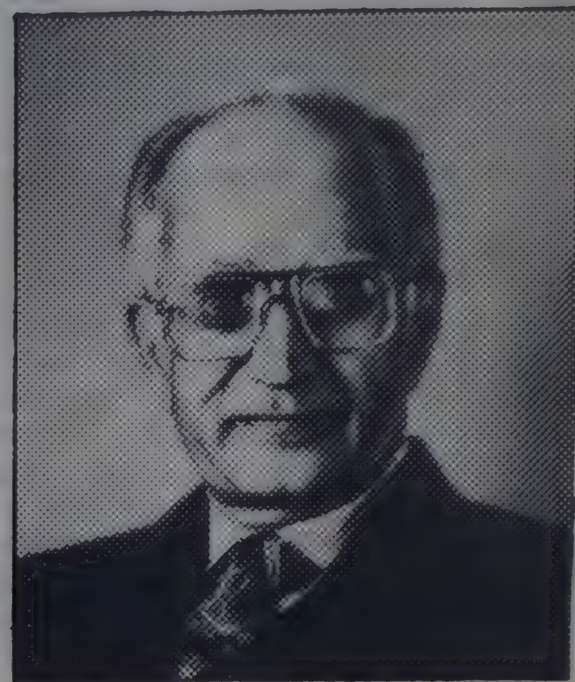
Chairman's Speech



Speech delivered by
Dr. Neelkanth A. Kalyani
Chairman, to the Members of the
Company at the 28th Annual General
Meeting held on 21st Aug. 1989

LADIES & GENTLEMEN,

On behalf of my colleagues on the Board of Directors and on my behalf, I extend to you all a hearty welcome at the Company's Twenty-eighth Annual General Meeting and thank you for sparing your valuable time and making it convenient to attend this meeting.

Having regard to an amendment to the Income Tax Act, 1961, the financial accounting year of the Company has been changed from October – September to April – March, and accordingly the Annual Report sent to you, along with the Notice for this Annual General Meeting, covers a period of 18 months from 1st October 1987 to 31st March, 1989. The Annual Report containing the Directors' Report and the Audited Accounts for the period ended 31st March, 1989 has been with you for quite some time and, I am sure, you have had the opportunity to peruse them.

As you would have observed from the Directors' Report, your Company has continued to maintain an upward trend in its business operations. The Directors, keeping in view the extended period of the financial year and having regard to the overall performance, recommended payment of an Interim Dividend of 25% on the pre-bonus Equity Share Capital of Rs. 52.725 million which was disbursed on February 6, 1989. The Directors have recommended a final dividend of 12.50% on enhanced capital of Rs. 105.450 million after issue of Bonus Shares in the ratio of 1:1.

Your Company continues to maintain its level of exports business with a diversified customer base and hopes to maintain the upward trend in the current year as well. The turnover of the Company in the first four months of the current financial year is higher by about 29% than that during the corresponding period of the previous year.

This is the terminal year of the current Five-Year Plan. As we launch ourselves into the Eighth plan period, we need to set out our perspectives and design strategies which take into account the challenges that we expect to encounter in the next five years. The acute Balance of Payments position is a cause of tremendous concern not only for policy makers in the Government but also to all of us in Industry. There is a tremendous need to galvanise our export effort. The prospects appear to be bright. Although the first year of the Seventh plan recorded a negative export growth rate of 7.2% with the trade deficit amounting to an unprecedented Rs. 87,630 million, subsequent years have witnessed remarkable growth in exports. In 1988-89, exports topped the Rs. 200,000 million mark for the first time, recording an impressive growth of about 30% over the previous year. Through a process of pragmatic selectivity, Government has been successful in somewhat slowing

without a corresponding growth in imports and thereby bringing down the trade deficit.

Several new measures have been taken by the Government to give a boost to exports. Most notable perhaps was the Prime Minister's initiative in setting up a high-powered Board of Trade under the Chairmanship of the Commerce Minister. This forum provides, for the first time, closer interaction between Government and Industry in matters relating to the Country's foreign trade policies. The quick establishment of five Sub-committees under the Board of Trade to advise it on major issues, only goes to prove the firm commitment of both Government and Industry to remove any impediments in increasing exports.

While the general overall scenario for growth in Indian exports appear very promising, there are a few issues that need to be addressed with particular reference to the Engineering Industry. The Engineering Sector represents the segment of industry in which the percentage of value-added is perhaps potentially the highest. For example, in the Forging Industry the percentage of value-addition could be as much as over 90%. It is necessary that such segments of industry which have greater export potential be encouraged by raising their level of competitiveness to bring them at par with their overseas competitors. These industries should be permitted access to the most modern technologies and equipment at the same prices at which these are available to their counterparts abroad. While the initial purchase price of equipment is the same everywhere, Indian importers have to pay more import duties on such equipment which is being brought into the country. In addition, the interest rate that we have to pay on capital that we borrow for purchase of such equipment is also significantly higher than that prevailing overseas. These higher costs have a cascading effect on the price of our end products which become that much more costlier as compared to those of our overseas competitors.

The expected emergence of major industrialised blocs in world markets is another potential challenge for Indian exports. A common European market by 1992 is almost a reality and with re-alignments taking place in the two other large markets of the world, namely U.S.A. and Japan, we can expect increased protectionism against our exports. We need to perhaps consider the Japanese example of setting up uints in U.S.A. and Europe when we attempt to evolve strategies to counter this challenge.

I would also like to touch upon a major event which is going to take place in the Indian Forging Industry. I am referring to the XIII INTERNATIONAL FORGING CONGRESS which will be held in New Delhi in January 1990. It will be for the first time in the history of these Congresses that the International Forging Industry will be meeting in a developing country It is expected that about 600 foreign delegates will attend the Congress and we shall have at least an equal Indian participation. The Congress aims at bringing together, on a common platform, not only the Forging Industry but also its major suppliers and users, so that they can together address the theme of the conference – "FORGING INTO THE 21ST CENTURY". This event will provide an unique opportunity to the Indian Forgings Industry to internationalise.

I take this opportunity to express my sincere thanks to the Central Government, the Government of Maharashtra and the Financial Institution/Banks for their encouragement and support to our company. I would like to thank our collaborators for their help and assistance. I would also like to place on record my sincere appreciation of the contributions made by the employees at all levels, under the overall guidance of the Vice Chairman, towards the Company's progress and growth.

Whilst concluding, on behalf of my colleagues on the Board and my personal behalf, I convey our gratitude for the confidence you have reposed in us. I sincerely hope that you will continue to extend your whole-hearted support and confidence in the future as well, to enable us to further improve the working of the Company.

Thank you!

Bharat Forge

Note: This does not purport to be a record of the proceedings of the Annual General meeting.

arat and West Bengal (0.6 each).

In registered manufacturing Kerala has a egative employment elasticity of −0.1, ecause of negative employment growth rate. n this sector also Rajasthan has the highest mployment elasticity at 2.3. Bihar, laryana, Karnataka, MP, UP and West lengal also have above unity employment lasticity in registered manufacturing. Punab and Maharashtra have very low elasticity.

In tertiary sector the employment elasticiy at the aggregate level is less than unity in ll states. The highest elasticity has been ecorded by Orissa (0.85) followed by West Bengal (0.82), MP (0.74) and Rajasthan 0.72). Punjab and Haryana have very low lasticity: 0.48 and 0.45 respectively. Within ertiary sector public administration has in general lowest employment elasticity, indicating that growth of income has been rising much faster than employment in this secor. In general also organised tertiary sector seems to have relatively lower employment elasticity than unorganised tertiary sector. This may be due to relatively lower wage rate in the unorganised sector in comparison to organised sector.

It is interesting to note that with one major exception (Maharashtra) employment elasticity has been higher in manufacturing in comparison to tertiary sector as a whole in all states. Also in most states employment elasticity in agriculture has been higher than in tertiary sector as a whole. It may be noted that while the share of unorganised sector in total tertiary sector employment has a larger weightage, in case of income it is the other way round.

IV

Agriculture-Industry Cleavage: An Explanation

We have seen in the previous section that the growth rate of industrial output has been in general greater than agricultural output. But the relative differences between growth rates of industry and agriculture vary significantly across states. We have also noted that the employment elasticity of income has been less than unity in practically all tertiary activities including public administration. In registered manufacturing sector also employment elasticity has been less than unity in a large number of states. The relatively slower growth of employment *vis-a-vis* income in non-agricultural sector restrains the demand for agricultural wage goods in relation to non-agricultural income. The relatively faster growth of non-agricultural income over employment on the other hand generates greater demand for industrial goods. Thus, given the supply constraint, the relative growth of industry over agriculture would depend upon the relative growth of non-agricultural income over employment. To test this hypothesis we may regress difference between growth rates of industry and agriculture on the difference between growth rates of income and employment in non-agriculture.

Agriculture is basically supply constrained. At the aggregate level the growth rate of agriculture would have very little sensitivity to demand though relative prices may affect composition of agricultural output. Industry on the other hand is both demand and supply constrained [Chakravarty: 1979]. The growth rate of industry would depend only partly on capacity creation and partly on demand. Given capacity, the utilisation of capacity would vary partly in relation to supply of key inputs, like power and agricultural and non-agricultural raw materials, and partly in relation to demand. A higher growth of agriculture may therefore generate higher output of industry through greater supply of agricultural raw materials and demand for industrial products. However, industry-agriculture relationship may not be uniform as the pattern of industrialisation varies across states. Traditionally industrial states—Maharashtra, Gujarat and West Bengal—depend relatively more on all-India and external market demand. The growth rate of industry in these states, therefore, may not be very sensitive to performance of agriculture and demand generated within these states. We may also note that these states suffered from acute power shortage during the seventies and consequently the growth rates of industry in these states were less than potential. Secondly, states having a high share of capital goods in total industrial output would also be relatively less sensitive to demand generated by agriculture and employment. A state like Orissa, therefore, could achieve a very high growth rate of industry of 8.5 per cent with only 2.0 per cent growth rate of agriculture because of a very low share (only 12 per cent) of consumer goods in total gross industrial output (see Table 4). MP also having a relatively lower share of consumer goods, performed well in industry despite a negative agricultural growth. Tamil Nadu achieved a high growth rate of industry with negative growth rate of agriculture presumably because of its greater dependence on all-India market for consumer goods.

From the discussion above we may postulate that the difference between growth rates of industry and agriculture (YI−YA) would be a function of the difference between growth rates of income and employment in industry (YI−EI) and tertiary (YT−ET). The differences in the pattern of industrialisation among states may be captured through two intercept dummies: Dl (1 for Maharashtra, Gujarat and West Bengal and 0 for other states) and D2 (1 for Tamil Nadu, Orissa and MP and 0 for the rest). Equation (1) presents estimates of this function for 14 major states for the period 1970-71 to 1980-81.

TABLE 3: EMPLOYMENT ELASTICITY OF GROWTH—1970-71 TO 1980-81, ALL INDIA AND INDIVIDUAL STATES

(Per cent pa)

State	Agriculture, Forestry and Fishing	Registered Manu-facturing	Tertiary: Transport, Storage, Communication	Tertiary: Banking and Insurance	Tertiary: Public Administration	Tertiary: Wholesale and Retail Trade, etc	Tertiary: Real Estates, Business Services, etc	Tertiary: Other Services	Tertiary: Total Tertiary

Haryana	0.88	1.05	0.72	1.18	0.25	0.40	0.98	1.19	0.45
Karnataka	0.80	1.39	0.47	0.88	0.07	0.84	0.41	1.27	0.55
Kerala	−0.03	−0.13	0.67	0.69	−0.15	4.17	0.23	0.32	0.53
Madhya Pradesh	−3.22	1.15	0.81	0.76	0.22	12.50	0.77	0.39	0.74
Maharashtra	0.51	0.52	0.76	0.89	0.32	0.60	−0.05	1.85	0.69
Orissa	1.01	0.83	0.79	0.95	1.19	2.56	−1.41	0.34	0.85
Punjab	0.43	0.55	0.75	0.90	0.21	0.47	0.08	0.69	0.48
Rajasthan	1.75	2.32	1.02	0.73	0.23	1.39	0.64	0.62	0.72
Tamil Nadu	−10.52	0.72	0.43	0.64	0.06	1.25	1.51	0.42	0.52
Uttar Pradesh	0.73	1.14	0.67	1.14	0.24	0.87	−0.23	1.02	0.60
West Bengal	0.61	1.54	0.52	1.07	0.60	1.43	0.17	−1.88	0.82
All India	0.98	0.99	0.55	0.86	0.22	0.74	0.32	0.76	

Note: Employment Elasticity of Growth = per cent change in employment/per cent in change income.

Source: See Tables 1 and 2.

$$(1)\ (YI-YA) = \underset{(4.20)}{2.92} + \underset{(2.28)}{0.22}\,(YI-EI) + \underset{(2.23)}{0.60}\,(YT-ET) \underset{(-3.74)}{-2.41}\,D1 + \underset{(4.34)}{2.91}\,D2$$

$$\bar{R}^2 = .84 \quad F = 17.67$$

All the estimated parameters in this function turn out to be significant (at 5 per cent level) except that of YT–ET which is significant at 10 per cent level and marginally below the level of significance at 5 per cent. However, (YT–ET) as well as (YI–EI) turns out to be individually significant (at 5 per cent level) when we use them in separate functions, as may be seen from equations (2 and 3).

$$(2)\ (YI-YA) = \underset{(11.86)}{4.31} + \underset{(2.56)}{0.27}\,(YI-EI) \underset{(-4.43)}{-3.03}\,D1 + \underset{(3.15)}{2.15}\,D2$$

$$\bar{R}^2 = .77 \quad F = 15.61$$

$$(3)\ (YI-YA) = \underset{(3.24)}{2.65} + \underset{(2.50)}{0.77}\,(YT-ET) \underset{(-2.89)}{-2.20}\,D1 + \underset{(4.03)}{3.18}\,D2$$

$$\bar{R}^2 = .77 \quad F = 15.39$$

The coefficients of all the variables in all equations are fairly stable with proper sign and the overall goodness of fit in terms of $\bar{R}^2$ and F ratio is quite satisfactory. In all 84 per cent of variations in the growth differentials between industry and agriculture can be explained in terms of growth differentials between income and employment in non-agricultural sector and pattern of industrialisation dummies. This is quite significant considering the fact that this function is estimated at cross-section level using growth rates of variables.

Equation (1) suggests that if employment and income grow at the same rate in both industry and tertiary sectors then the average normal growth rate of industrial income would be about 3 percentage points above the agricultural income growth rate, or if the average growth rate of agricultural income is about 2.5 per cent then the average normal growth rate of industrial income would be about 5.5 per cent. However industrial income in Maharashtra, Gujarat and West Bengal would have increased only by .5 per cent (2.9–2.4) above agricultural growth rate, and in Tamil Nadu, Orissa and MP would have increased by about 5.8 per cent (2.9+2.9) above agricultural growth rate. The growth differentials between industrial and agricultural income would be 0.2 and 0.6 per cent higher for every 1 percentage point increase in growth differentials of income and employment in industry and tertiary sectors respectively. Since agriculture is basically supply constrained the growth differentials between industrial and agricultural income would arise mainly on account of demand induced increase in industrial output. Further, our results suggest that demand induced industrial growth arise more from the tertiary sector income and employment growth differential than that of industrial sector.

If we disaggregate tertiary into public administration and other tertiary activities then we can see (equation 4) that the growth differentials between industrial and agricultural income depend significantly on growth differentials between income and employment in public administration than in other activities. However, overall goodness of fit of equation (4) turns out to be inferior as compared to equation (1).

$$4)\ (YI-YA) = \underset{(2.84)}{2.57} + \underset{(1.05)}{0.13}(YI-EI) + \underset{(1.94)}{0.16}(YP-EP) + \underset{(1.38)}{0.48}(YT^*-ET^*) \underset{(-3.04)}{-2.21}D1 + \underset{(3.75)}{2.99}D2$$

$$\bar{R}^2 = .82 \quad F = 13.21$$

(Where YP and EP are income and employment growth rates in public administration respectively and YT^* and ET^* are income and employment growth rates in other tertiary activities respectively.)

V

All-India Industry-Agriculture Growth Scenario

There has been a big spurt in the growth rate of industry in the eighties as compared to the seventies. The current industrial growth rate is comparable to that in early phase of industrialisation during Second and Third Plans. The industrial growth rate in eighties is higher when estimated from the New Series of Industrial Production (base 1980-81) as compared to the Old Series (base 1970-71). The industrial growth rate in the eighties has accelerated despite any marked improvement in agricultural growth rate.

We have already seen in Section V that at the state level industry-agriculture growth differentials depend crucially on the income

TABLE 4: COMPOSITION OF GROSS VALUE OF OUTPUT (1981-82)—CENSUS SECTOR

(Per Cent)

State	Consumer Goods	Rest
Andhra Pradesh	42.49	57.51
Bihar	6.14	93.86
Gujarat	38.38	61.62

Source: *Economic Survey*, 1988-89 and 1980-81.

employment growth differentials. This hypothesis seems to be valid at the macro level also, as can be seen from Table 5. We note that GDP from both industry and tertiary sectors have accelerated in the eighties as compared to the seventies. However, growth rates of employment in both public and organised private sectors have decelerated in the eighties as compared to the seventies. With relatively slower growth of employment in relation to income in non-agricultural sector the demand for industrial goods is likely to have increased greater in eighties, and consequently industry agriculture growth differentials have widened.

Table 5 shows that employment in organised private sector has been growing slowly in the seventies. However, its growth rate in the eighties has been mostly negative. The growth rate of employment in public sector (including public enterprises) has also receded in the eighties. Such slow growth of employment in both public and private sectors must have restrained the demand for wage goods whereas high rate of growth of non-agricultural income must have contributed to the demand induced growth of industrial production. However, it is not possible to confirm this econometrically because of lack of comparative estimates of national income of constant prices for seventies and eighties.

The increasing disparity between income and employment in non-agricultural sector has an adverse implication on income distribution, which is partly reflected in the pattern of industrial growth in the recent years. The production of necessities like manufactured food, clothing, etc, has increased only modestly in the eighties, whereas production of luxury items, and particularly consumer durables, is rising now very rapidly, as would be evident from recent statistics on industrial production [*Economic Survey*, 1988-89 and *Report on Currency and Finance*, 1987-88].

If we compare the pattern of industrialisation of the eighties with its early phase of Second and Third Plans then we may notice while in the early phase the big spurt in industrial production came mainly from basic and capital goods, in the current phase it is more from consumer durables. Also in the current phase there is relatively more incentive for both production and consumption of consumer goods than before. Further the widening base of middle-class and fiscal concession given to them in the recent years have generated additional demand for luxury goods.

It may be noted while analysis of employment growth in states is based on census data the same at the macro level corresponds to only organised sector. It is possible that there is a positive growth of employment in the unorganised sector; however there is no evidence of any significant improvement in income and standard of living in the unorganised sector.

VI
Conclusion

The following conclusions may be drawn from this analysis. At the state level we find a great deal of variations between industrial and agricultural growth rates. This can be largely explained in terms of income and employment growth rates in industry and tertiary sectors. However, the pattern of industrialisation varies across states. The traditionally industrial states depend more on all-India and external markets for the sale of industrial output, and consequently their industrial performance is less dependent on income and employment growth within the state. Also, states with a very low share of consumer goods in total industrial output is less sensitive to demand generated within the state.

It is interesting to note that the employment elasticity of output in general is lower in the tertiary sector than in agriculture and manufacturing in all the states. Further, the employment elasticity of output in the tertiary sector is less than unity in all the states. Within the tertiary sector, public administration and defence has in general lowest employment elasticity indicating that wage rate has been rising faster than employment in this sector. The organised tertiary sector as a whole seems to have relatively lower employment elasticity than the unorganised tertiary sector.

At the macro level we find evidence that the growth differentials between industry and agriculture has widened during the eighties as compared to the seventies. This coincides with decreasing employment elasticity of output in both industry and tertiary sectors, and particularly in the organised private sector in the recent years. The macro evidence is, therefore, consistent with the state level evidence discussed above.

The increasing disparity between the income and employment growth rates and its consequent effect on agriculture and industry growth differentials has a wider implication on equity. The people already employed in the organised sector are enjoying the benefits of the current industrial boom, whereas the vast majority of the population in the unorganised sector is deprived of this benefit because of inadequate gainful employment and low wage rate. Thus, the urgent need of the hour is not industrial growth *per se* but industrial growth with more employment so that the benefits of growth can be shared more equitably by all sections of the population.

The Intelligentsia as a Ruling Class

Ashok Rudra

THIS has reference to the discussion piece of Ramaswamy R Iyer (March 11) on my article 'The Emergence of the Intelligentsia as a Ruling Class in India' (January 21). It is understandable that one should be somewhat confused about the identity of the class I have called the Intelligentsia, its lines of demarcation from other classes and the common properties shared by different members of the class, as I have myself taken different stands on this point in my notes and in the body of the article (and all the more so as by some clumsy handling there has been some mess created between notes 6 and 7). Classes are like elephants which are easy to identify but difficult to define. I stand by my identification of the class in terms of the sections of the population covered by it, as well as the social characteristics described by me. However, at the time I wrote the paper I was dissatisfied myself about how to give a theoretical definition to the class. As such, my treatment of this most important question in the body of the text reads as if the demarcation depends on the distinction between manual and non-manual labour. I agree with everything Iyer writes about this being not at all satisfactory. On the other hand, I think I gave a perfectly satisfactory solution to the problem in note 6, where I define the class as follows: "Members of this class sell their services at a price *higher* than the value produced by them. It may be noticed that I am making use of Marx's distinction between value produced by a labourer and the value of the labour power of that labourer. Workers in the Marxian scheme sell their labour power at a price lower than the value of what they produce. Members of the intelligentsia do the opposite—instead of generating a surplus they receive more value than they produce, the difference being filled by a transfer from the surplus generated by labourers engaged in material production. They therefore have the same position in relation to other classes as what has been called the 'labour aristocracy'."

I have taken the trouble of quoting extensively for my own writing as I had intended what is now printed as note 6 to replace note 7 altogether. Confusion arises from different things being said in the body of the text, in note 6 and 7. Bungling arose as a result of the rush in which the paper was sent for publication. I do not regret the rush. *EPW* is unique in the world of periodicals in the social sciences for providing a forum for discussion of problematic issues even while they arise in the work of researchers. I wanted to take advantage of this marvellous opportunity for getting the benefit of discussions. I already had the benefit at the time of publishing of having the commentaries and rejoinders of Andre Beteille and Pranab Bardhan and now I have the benefit of the various questions raised by Iyer.

Now that I have clarified that the members of the intelligentsia class are not defined as those who engage in mental labour and do not produce any value, most of the serious questions raised by Iyer cease to apply. There is no question of unskilled workers being more important as producers than skilled workers, masons being more important than architects, production taking place without the help of managers. Accountants and clerks can also be recognised for the contributions they make to the process of production. All that is necessary for my purpose is that the members of the class including "judges, managers, teachers, poets and professors" receive a value for their services higher than the value of the products produced by them.

I do not see any problem with there being very great disparities in the income and wealth, earned and possessed by different members of the class and their having common life styles, "at least common aspirations". This is one matter on which it is possible to have convincing empirical evidence. I have been carrying out a survey with two colleagues of mine in the Indian Statistical Institute into the consumption, habits and life styles of some sample households of people with white collar occupations. The results are being published in instalments in the *EPW*, the first three of which have appeared in the issues of April 22, June 10 and July 22. One of our most remarkable findings is that in a monthly income range stretching from Rs 3,000 to Rs 12,000 the consumption of a large number of items is either not responsive to income change at all or responsive to a very low degree. Whether one is a clerk or a high court judge one aspires to possess and use the same kind of consumer items—the differences being no more important than that between black and white TV and colour TV. This is what I meant by saying "a common life style, at least common aspirations".

The lack of any comparability with the standard of living of the vast majority of the population can also be statistically authenticated. We have got another paper ready for publication about the living conditions of the very poor in which we show that these very poor families do not possess even two sarees per adult female (whereas the number in the white collar group easily crosses 50). Iyer finds that the distinction I make between the 'Babu Class' and 'non-Babu Class' constitutes the weakest part of my paper. In my own judgment it is one of the most important points made in my paper.

Iyer raises many other points on which I do not think that I can give him any satisfaction. Thus, he has difficulties with the term 'contradiction'. For him it is a logical term. I have used it as a familiar technical term in Marxian Philosophy. But then Iyer is "unable to accept the view that thinking without an ideological framework is either impossible or pointless". For us, it is indeed impossible and pointless to think without a theoretical framework and in the social sciences a theoretical framework cannot but have an ideological content. My theoretical framework, which is that of Marxian political economy, is looked upon by Iyer as "the formidable ghost of Marx looming over Rudra's pages". After this, it is very difficult for any communication to take place between Iyer and myself. Before criticising and rejecting my propositions Iyer tries "to capture the different elements in Rudra's paper in a non-doctrinal statement without theoretical formulation". All through his piece Iyer reveals a strong allergy towards theoretical arguments and treats any attempt at theorisation as indulgence in doctrines. His anti-theory bias goes to such an extent that he has difficulties even with the distinction between the subjective and the objective, the short-run and the long-run. He writes "Anything can always be said to be objectively other than what it is. Similarly, anything which conflicts with our theory can be dismissed as a short-term phenomenon". Of course one can do no such thing. If 'contradiction' is a technical term in Marxian philosophy, the objective-subjective distinction is an established concept in philosophy in general. Similarly, the short-run/long-run distinction is an important notion in economics, both neo-classical and Marxian.

Crisis of Postponed Crisis

The advanced capitalist world is in the midst of a peculiar 'crisis of postponed crisis'. This has major implications for third world countries. Unless these countries are vigilant, the advanced capitalist countries will seek to overcome their predicament by exporting recession to the third world and inducing multinational banks to finance such exports by acquiring greater political leverage with *vis-a-vis* third world countries **2011**

Holes in Poverty Alleviation

IRDP has been one of the more important policy initiatives intended to alleviate large-scale poverty in rural India. A study of the programme in Andhra Pradesh, however, brings out that the coverage of target groups has been low and the impact on incidence of poverty marginal. Further, districts which are more advanced showed better performance than less developed districts indicating that benefits percolated largely to the fertile and irrigated areas. The most neglected segment of this development strategy is agricultural labour, particularly in the more backward regions. **2025**

Command Performance

The Eighth Plan approach paper, which has been formally adopted by the Planning Commission, has quite clearly been designed to suit the Congress(I)'s electioneering purposes. It cannot therefore be taken as a serious step in the planning process. **1989**

Biased Medical Care

Health services in Kerala are relatively well developed with at least one governmental health institution in every village. However, medical care is biased in favour of the elite classes because of at least three reasons: cost, travelling time and waiting time. **1991**

Caste and Class

In contrast to the traditional Marxist and the Ambedkarist unilinear viewpoints, multilinear historical materialism would view race, tribe, varna and jati as pre-class institutions of exploitation and administration. Such a view not only enables separate, comparative and objective studies of societies that had or have these institutions, but also brings out the present relations of caste-class struggles in their real concatenations. **2002**

Dispensing with the Dynasty

The innocent millions, whose formal votes have been instrumental in the sustenance of the Indian ruling dynasty till now, have to be weaned away from their loyalty to the concept of *advaita*. The first blow for Enlightenment is to dismantle the belief that the dynasty, this *particular* dynasty, has the divine eternal right to rule India and that, without its benign presence, the nation is bound to collapse. **1985**

Gold Standard Revisited

The British Indian gold standard has been a topic of controversy both among contemporaries of the period and among the latter-day scholars. Indian nationalist opinion generally alleged that India was denied the benefits of a full-fledged gold standard as a means to reducing its access to gold. Capitalising on the mercantilist flavour of this criticism, official opinion propagated the gold exchange standard as a cost effective variant of the gold standard. In fact the rejection of the plea for a gold standard had much to do with British and American interests, with Britain's external liquidity crisis in the inter-war years being a crucial consideration. **2015**

Unconstitutional

The bill introduced in the Rajya Sabha by the home minister last month to amend the Criminal Law Amendment Act, 1961 making it "an offence *per se* to publish a wrong map of India" is clearly unconstitutional. **1987**

Cause for Celebration

It was not at all surprising that the western media and the governments of the major capitalist countries have waxed lyrical over the recent developments in China. For long they had been proclaiming the demise of communism, and now the events leading up to June 4 gave them much succour. The tragic situation for the Chinese people became a cause for cheers and celebrations as far as these gentry were concerned. **1997**

Last Laugh

The Americans saw in Afghanistan a re-enactment of their own trauma in Vietnam. Only this time the victims would be the Russians. And it almost happened that way—almost but not quite. **1986**

LETTERS TO EDITOR

Police Lawlessness in Andhra Pradesh

THE kidnapping of K Balagopal has been a shocking episode. K G Kannabiran, president of the Andhra Pradesh Civil Liberties Committee (APCLC), has in a press statement said that he suspects that "Praja Bandhu", which has owned the kidnapping, is a "police outfit". The president of the Police Officers' Association, says Kannabiran, wanted to meet him personally; later he was told on the phone on behalf of Praja Bandhu that Balagopal had been kidnapped and would be killed unless two constables kidnapped by the People's War Group were released immediately. He was also told that Balagopal would be killed if any attempt was made to move a writ petition for his production in the court.

The police has been functioning as a lawless force for quite some time in several parts of India, particularly Punjab and Andhra Pradesh. At one time it was hoped by some that terrorism by extremists could be curbed by state terrorism. However, the unleashing of police terror on millions of people and countless deaths in 'encounters' have led nowhere to peace, but only to the new demon of police lawlessness. The rise of this demon now threatens freedom of every kind. Apart from being the general secretary of APCLC, Balagopal has been contributing richly to the understanding and solution of contemporary social problems; by choosing to kidnap him the police has announced that there is no freedom of thought or expression in this country unless it suits the police, the Constitution notwithstanding.

The police of Andhra Pradesh, it must be remembered, has the support of the ruling politicians and landlords. Violence on behalf of landlords, traditional as it is, rarely rouses public conscience; the police is even a more legitimate instrument than private armies. However, if N T Rama Rao does not desist from state terrorism, and cannot curb police lawlessness, his claims of being the harbinger of justice will be in vain.

Preserving Regulation

THE article 'Tribal Land Alienation in Andhra Pradesh' by T Prabhakar Reddy (*EPW*, July 15) clearly shows that the government's decision to repeal Regulation I of 1970 will result in accelerated tribal land alienation. The author explains the process by which the transfer of land from tribals to non-tribals takes place, and supports his argument with field-level data. As the author points out, the tribals in India are among the most 'historically disadvantaged bottom groups of society'. It is incredible that the many laws enacted for their protection have brought about such little improvement in their situation. Quite the contrary—the passing of lands from the powerless to the dominating class—has been happening.

As a student of anthropology, I feel that additional survey-based studies such as this would be useful for the formulation of informed decisions and measures to start to restore to the tribals some control over their own lives and the power to function in the complex society into which they are being thrust. The revocation of Regulation I of 1970 would have exactly the opposite effect, and so must not be repealed.

PAMELA RAO

Chicago

II

WE invite your attention to the article 'Tribal Land Alienation in Andhra Pradesh' by T Prabhakar Reddy (*EPW*, July 15). It is stated that the governor, who has otherwise a penchant for picking holes in the actions of the Telugu Desam government, has also ratified the repeal of Regulation I of 1970. To the best of our knowledge, the above statement is not correct as the governor has not yet approved the proposal for repeal of Andhra Pradesh Scheduled Areas Land Transfer (Amendment) Regulation I of 1970 as no such proposal seems to have been received by her. Further, the question of governor ratifying the action of the state government does not arise as according to the provisions of the Fifth Schedule of the Constitution of India the assent of the president of India is necessary for any change in the existing regulation. Otherwise such changes shall have no effect.

Production Centres for Refugee Women Workers

THE article 'We Demand Our Rights. Refugee Women's Long Journey' (July 8) truly depicts the 'struggle', 'strength' and 'spirit' of the women workers of the production-cum-training centres run by Delhi administration.

We, the children of our proud (illiterate) mother, now aged 68 years, who struggled for about 17 years (1955 to 1972) and worked in the production-cum-training centre at Kalkajee, New Delhi, join her in strongly protesting against the proposed closure of these centres. These centres with all their highly exploitative features—low piece-rates, deduction of 25 per cent of the wages for the use of the centres, ever rising costs of accessories such as buckram, zippers, cloth lining, etc—have been providing direly needed succour to the helpless and needy women.

It is pertinent to mention that the piece-rates in these centres which were fixed in the late 1950s remained unchanged even after the mid-1960s in spite of the fact that there had been very steep increase in the consumer price index (about 60 per cent) and specifically prices of food items during this period because of the composite result of the Chinese invasion, defence expenses, crop failures and extensive hoarding and black-marketing of foodgrains. And our mother's earnings, though meagre in real value despite the hard labour of more than 12 hours a day, constituted a major contribution for our struggling family members.

We demand that not only these centres should continue to function but the exploitative features built- in over the years be removed and all the workers presently working in these centres should be absorbed as regular employees of Delhi administration.

New Delhi

Face-Saving Formula

THERE is little reason to be optimistic about the prospect of a satisfactory settlement of the 'Bodoland' issue in the light of the developments in the week that has followed the signing of the tripartite agreement in Delhi on August 28. In the last one week, despite the commitment by the All Bodo Students Union led by Upendranath Brahma (ABSU-UB) to stop violence, more than 30 persons have been killed in the areas claimed for 'Bodoland'.

The agreement signed in Delhi now appears to have been merely a transitory device which was considered tactically necessary but which none of the parties seems to be seriously intent upon implementing. This is natural because the issue itself is so complicated and the stated demands and positions so completely irreconcilable that either the talks had to break down within minutes of beginning, after the well known positions were restated, or a face-saving formula had to be adopted without any of the parties ever meaning to implement the formula. In other words, there are strong indications that all the parties involved in the tripartite talks, for their own reasons, would rather allow the impasse to continue since for any solution there has to be considerable coming down from their present rigid positions. The ABSU-UB is realistic enough to see that their visions of a 'Bodoland' comprising virtually the whole of the north bank of the Brahmaputra (with additional safeguards for the plains tribal people on the south bank and for Bodo-Kacharis in the Karbi Anglong district) is simply not feasible since the areas neither have a Bodo (or even tribal) majority nor are they contiguous. This has been ominously and tragically evident in the calculated acts of violence let loose by the ABSU-UB in those parts of the north bank outside Kokrajhar district and Udalguri sub-division of Darrang district (where too the Bodo people are merely a dominant, not predominant, population) with a view to forcing the non-Bodos to move outside the areas and the frightful backlash and generalised communal violence that broke out—and is still continuing on a small scale in areas westwards. But the ABSU-UB leadership quite simply cannot come down since as it is there are indications that the leadership is not entirely in control of the situation on the ground. This is again a pattern that strangely recalls the dilemmas that the AASU leadership faced at the height of the Assam agitation.

The government of Assam certainly wants the agitation to end, but on its own terms. The present leaders seem incapable of understanding the stirrings among the state's indigenous minority communities since they view them, at least in words, as simply no different from other Assamese speaking people integrated into the pan-Indian network of caste Hindus and Muslims. Even less are they able to comprehend the fact that the ambitions and expectations that they themselves had released during the six-year long Assam agitation, and the fears and prejudices they had exploited (as much as the genuine issues they had raised) are once again animating an agitation that has consciously replicated itself along the lines of the AASU agitation. Quite simply the ABSU-UB agitation, like other as yet dormant movements in the state, challenges the deeply-held ideological conviction about what constitutes Assam and the Assamese people.

Thus locked in a combat which by definition admits no winners, the exploitation of these rigidly held stands for its own partisan ends has been a relatively simple task for the union government which increasingly has to be read as no more and no less than an amoral alliance of market operators in business and industry, bureaucracy and factions of the Congress Party organisation, all now collectively going under the name of the Congress(I). The union government certainly does not want to yield to the demand for creation of another state since its whole thrust has been towards making the existing states irrelevant. But it certainly has found the ABSU-UB agitation useful to put pressure upon the AGP government which despite its best behaviour has now come to be seen as an adversary—simply because it has been insufficiently humble. Only this explains the encouragement that the ABSU-UB agitation has received even as leaders of the union government have been repeating that there will be no further division of Assam, though whether the ABSU-UB agitation has received active assistance and training in the execution of its violent programmes, including bombings and killings, has to remain a matter of speculation given the nature of the agencies alleged to be involved in such operations and their styles of functioning.

It is therefore time that both the Assam government and the ABSU-UB should demand that the union government should stand up to be counted, formally, in the presence of representatives of the two adversaries on the 'Bodoland' issue. Much of the suspicion that the ABSU-UB is merely allowing itself to be utilised by the union government will disappear if it were to insist upon what it has maintained in the Delhi discussions—that the next round of talks have to be at the initiative of the union government with Buta Singh himself participating. The government of Assam too has said that it has 'no objection' to this, though in its own interest and in the larger interest of the people of the state and the region it should have been as insistent upon the presence of the home minister and a formal declaration of the centre's stand on the whole issue in the presence of the representatives of the government of Assam and the ABSU-UB, as the ABSU-UB has been. If this were to be insisted upon by both the parties, perhaps the time for playing games in Assam would be over.

POLITICS

Beyond Bharat Bandh

ACCORDING to available reports, the Bharat bandh on August 30, sponsored by the opposition parties, was a considerable success as it has marked an extension of their mass support in comparison with the similar exercise last year. Apart from the expected success in the states under the opposition parties' rule, which now extends to Tamil Nadu but excludes Karnataka, the bandh call this time received significant responses in a number of the Congress(I)-ruled states—notably Bihar and Orissa. Capital cities of the Congress(I) states like Uttar Pradesh, Madhya Pradesh, Rajasthan and Gujarat and some other smaller towns in those states were not totally unaffected by the bandh call. Even in and around Delhi, industrial and business establishments as well as schools, colleges and universities were largely closed or at least deserted. All this certainly bears witness to a considerable erosion of the Rajiv Gandhi's legitimacy and mass support, particularly in the wake of the demonstrated inefficacy of the government's systematic campaign against the bandh on the TV and radio, the allurement of food and fun for the union government employees opting for overnight stay in their respective offices on the bandh-eve, not to mention the elaborate bandobast for intimidation through large-scale police mobilisation and the arrest and detention of tens of thousands of workers and leaders of the opposition parties.

However gratifying these achievements may be, the opposition parties have to face the present situation without blinkers, that is, if they do not wish to deceive themselves into smug self-satisfaction. The opposition has to reckon with the following questions in particular:

First, the new phase of the opposition offensive which had started with the demand for Rajiv Gandhi's resignation following the revelations and strictures contained in the CAG report on the Bofors deal and was raised to a new height with the mass resignations of the opposition members of the Lok Sabha may be said to have closed with the recent Bharat bandh. The initiative at the moment has ceased to be with the opposition whose general expectation now is to meet the Congress(I) for the next round at the general elections slated by the year-end. This leaves the initiative, if only a limited one, with Rajiv Gandhi whose prerogative it is, as the prime minister, to fix the exact time for the polls within the statutorily defined period.

vernment's
1970 will
lienation

But, will it be really wise for th tion to take the Lok Sabha election the due period for granted? The speculations, or misgivings, occasionally voiced about the existence of a contingency plan in the top drawers of the top policy-planners in New Delhi to put off the polls under certain circumstances cannot be brushed aside as nonsense. In view of all this it would be wise for the opposition now to launch on a nationwide campaign for ensuring the Lok Sabha elections by the year-end.

Secondly, while recognising and registering the relative advance that the recent Bharat bandh does represent, it would be unwise to overlook that it does not reveal any big leap in public opinion in the so-called Hindi heartland in favour of the opposition. More importantly, the opposition, the left parties in particular, should note that the making of corruption in high places the main issue of the campaign as they have done is not an example of good strategic planning. Firstly, it is something rather remote for the common people. Secondly, corruption may not really serve as a helpful quality to demarcate the opposition from the ruling party as the opposition stalwarts are not perceptibly immune from the same disease. Thirdly, however enormous it may seem to be by its own standards, corruption cannot explain the crisis of the socio-economic system and all its political reflections.

Finally, for a successful mass campaign, key political issues have to be so formulated that common people may easily identify their appropriate and correlated economic and moral-ethical counterparts. Gramsci's contention that economic, political and philosophical representations of any concrete phenomenon should all be translatable into one another's language is not an idle platitude. Hence, the left parties should take the initiative to come out with a package of key economic, political and moral-ethical issues affecting the life and well-being of the Indian masses, that is, outlining the path to improved living standards, guaranteed democratic norms and a corresponding upgradation of ethical conduct of the politicians and administrators.

BOFORS

Getting Closer

FORMER chief of army staff K Sundarji's startling interview to *India Today* has peeled off some more layers from the government's package of fabrications on the Bofors gun deal. Most importantly, Sundarji's disclosures, perhaps more than any other piece of evidence dug up so far, have served to strengthen suggestions of the prime minister's direct culpability in the matter.

The former chief of army staff has revealed—and this is now authenticated by the government through the statement issued on Wednesday by the Defence Wing of the Press Information Bureau—that he had dvised the government in writing that it should use the threat of cancellation of Bofors' contract in order to compel the company to come out with the details of the so-called commissions it had paid to get the contract, including the identity of those who had received the payments. And should Bofors still refuse and the contract have to be actually cancelled, Sundarji had given it as his considered opinion that this would mean a delay of 18 months to two years in the acquisition of the guns from an alternative source which he as the army chief regarded as "an acceptable risk". According to Sundarji, it was the prime minister who had shot down the proposal to compel Bofors to come out with the truth. Rajiv Gandhi apparently put his foot down at a meeting at his house on July 4, 1987 at which the minister of state for defence and defence ministry officials were present.

The defence ministry's statement, while it cannot deny that Sundarji had indeed tendered the advice he says he had, seeks to justify the rejection of that advice with the assertion that "national security is much larger than its military aspect" and that therefore "the views of the [chief of army staff] though important cannot alone determine national security decisions". However, this statement overlooks two important facts.

First, it is spokesmen on behalf of the government and the prime minister personally who, no doubt convinced that they would not be believed if they put it out as their own view, have claimed repeatedly in parliament and outside that the option of threatening Bofors with the cancellation of the contract had to be ruled out because the security implications of this particular step had been held to be unacceptable by the army authorities. It has now been established that what the army authorities, at the very highest level, had told the government was exactly the opposite.

Second, and more important, the view that Bofors should be confronted with with the prospect of losing the gun deal and that the security risk of possible cancellation of the contract could be regarded as acceptable was not that of the then chief of army staff alone; it was also that of the then minister of state for defence, Arun Singh, who certainly could not be said to have taken a purely military view of the matter and who in fact went so far as to resign from the council of ministers because his advice was not heeded. So the homilies contained in the defence ministry's statement that "national security is much larger than its military aspect" and that the views of the chief of army staff "cannot alone determine national security decisions" are thoroughly beside the point in this particular instance. It should be added that the chances of the contract for the guns having to be actually cancelled were very slim, for it is inconceivable that Bofors would have opted to lose the hard-won multi-billion dollar deal rather than disclose the identity of those to whom they had paid the commissions. It was the Indian side which had everything to fear from such a disclosure, not Bofors.

With the chief of army staff and the minister of state for defence (who, let it be remembered, because of his then closeness to the prime minister and because the defence portfolio was nominally in the charge of the prime minister had all along

been functioning as *de facto* defence minister) advising the same course of action, it is obvious that this advice could have been rejected only by Rajiv Gandhi. The government's laboured efforts to controvert General Sundarji's account of the meeting at the prime minister's residence on July 4, 1987 at which, according to Sundarji, Rajiv Gandhi berated those present for urging that Bofors be threatened with cancellation of the contract are also therefore quite immaterial.

The decision to reject the option of compelling Bofors to disclose the details of the commissions paid was, it is clear as daylight, that of Rajiv Gandhi who overruled the advice of not only the chief of army staff (who might be said to have taken a purely military view of the matter) but also the minister of state for defence. That is the import of General Sundarji's interview and that stands despite the government's attempted denial through this week's orchestrated statements from the defence ministry, the then defence secretary (now governor of Sikkim) and the then additional defence secretary. This of course immediately brings up the politically all-important question: why, but why, was the prime minister so anxious to rule out use of the one weapon which was most likely to make Bofors come out with the truth, specifically the identity of those who had received the illegal payoffs? The answer to the question is, it seems, getting plainer with every passing day.

MRTP ACT/FERA

Preparing the Ground

NO major changes in industrial policy in the direction of further deregulation can be expected at the moment because elections are only a few months away. The ASSOCHAMs or the Abid Hussains know this and yet they are keeping up the momentum of the campaign. One major policy change that has been eluding foreign business interests and/or large Indian industrial houses is deregulation with respect to MRTP and/or FERA companies. The proposal to liberalise licensing policy for FERA/MRTP companies/business houses came up before the Cabinet Committee on Economic Affairs (CCEA) some months back but the plan was shelved, presumably because the timing was politically inappropriate.

Viren J Shah, president of ASSOCHAM, has presented proposals for amendment of the MRTP Act under three headings. Basically these relate to Section 20 of the Act which determines which categories of undertakings should come under the ambit of the provisions with regard to concentration of economic power. ASSOCHAM wants the minimum asset limit to be raised from Rs 100 crore to Rs 500 crore. Similarly the minimum asset limit for a 'dominant' undertaking should be raised from Rs 1 crore to Rs 25 crore. ASSOCHAM has also suggested that companies in which the financial institutions hold more than one-third of the voting power should be brought out of the 'interconnection' ambit. Viren Shah presumably wants it to be believed that the financial institutions indeed safeguard 'social' interests and not the private interests of the managements.

Speaking at a recent seminar in Madras on August 17 Abid Hussain, member, Planning Commission, advocated the scrapping of FERA to attract foreign investment. Needless to say, this is in line with the ASSOCHAM's interests. The arguments being heard are that following the worsening of the balance of payments and a peak reached in the debt-service ratio, the time has come to attract foreign direct investments. But these lobbyists are also realistic. For the moment, they are asking that just as equity held by the International Finance Corporation (IFC) is not included as part of foreign investment for FERA purposes, the same should be extended to other development finance agencies like DEG, CDC, Swedfund, Finnfund, etc. The point is are the IFC or these foreign financial institutions 'neutral'?

Raising the FERA limit itself 40 to 51 per cent has been opposed by some Indian business interests, particularly in the pharmaceutical industry. One remembers their past representation to the government against treating the companies with 40 per cent foreign equity as Indian companies. They wanted the facility to be restricted to companies with foreign equity up to 26 per cent only. The government is keen to put foreign investment on the 'fast track'. Recently, the finance secretary, Gopi Arora, hinted at the setting up of a board for foreign investments on the lines of the one for trade to sort out the problems of foreign investors.

SOVIET UNION AND INDIA

Myopic Vision

GLASNOST does not seem to have improved the Soviet Union's myopic vision of the Indian political situation or brought about any change in its infantile loyalty to the Nehru dynasty.

During a recent visit to Delhi, the Soviet vice-president Valentina S Shevchenko was so impressed with prime minister Rajiv Gandhi that she chose to give his controversial Panchayati Raj Bill a clean chit saying that a similar bill to devolve power to villages would be introduced in the Soviet parliament in October. She had the temerity to rebuke the Indian people, when addressing them she said: "Not many people in your country have properly understood the bill that seeks change at the grassroots level". In an indirect criticism of the CPI and the CPI(M) which have been opposing the bill as a threat to the autonomy of state governments, the Soviet vice-president asserted that it was in no way an infringement on the powers of the state. Her statement as usual ended with the expression of Moscow's traditional code of respect reserved for Jawaharlal and his descendants: "policies of non-alignment, non-violence and economic progress" which, according to her, made Rajiv Gandhi popular both in India and the Soviet Union!

At around the same time when the Soviet vice-president was heaping accolades on Rajiv Gandhi in New Delhi, the Soviet foreign affairs weekly *Noroye Vremya* came out with a commentary which amounted to a defence—weak though—of the ruling Congress(I) against opposition attacks. Pooh-poohing the opposition charges of corruption against the Congress(I) government as the only trump card to be used by the opposition in the coming elections, the commentary dismisses the CAG report on Bofors as something which did not add to the weight of opposition accusations. Describing the electoral policies of the communist parties as a "flexible approach", it speculates that the communist rejection of joint action with the BJP is a "cold shower for those who had hastened to advertise a possible united front of opposition to the Congress(I)".

It is ironical indeed that a Soviet commentator finds no weight in allegations of corruption against the state involving crores of rupees, and tends to dismiss the entire issue as an electoral trump card to be used by the opposition. May be, cases of nepotism, embezzlement, bribery have become so common in the Soviet Union (judging by the revelations coming out now) that they no longer disturb the conscience of Soviet political commentators. Or, is corruption a localised issue—to be punished in the Soviet Union (as Brezhnev's son-in-law has been penalised) but to be dismissed in India, the Soviet Union's third world model of utopia of "non-alignment, non-violence and economic progress"? One wonders how Moscow will react, if the Indian people ever decide to punish Rajiv Gandhi for corruption and other misdeeds—may be in another utopian situation, but a situation which will perhaps better reflect the Indian popular psyche than Moscow's wishful thinking.

It is surely not accidental that the Soviet vice-president and the Soviet political commentator have come out with kudos for Rajiv Gandhi on the eve of the coming elections. It is in keeping with the Soviet policy towards India. Way back in the 1950s Khrushchev visited India—on the eve of elections in Andhra Pradesh, which used to be a communist stronghold in those days—and issued a chit in favour of Nehru's 'progressive' domestic policies, which came in handy for Nehru's party in Andhra Pradesh to use as propaganda for defeating the communists. After more than three decades, one hopes that the Indian communists—if they are seriously interested in ousting Rajiv Gandhi—will have the courage to publicly condemn the recent Soviet statements supporting Rajiv Gandhi and dissociate themselves from the glib Soviet assessment of India's "non-alignment, non-violence and economic progress".

STOCK MARKET

Not the Beginning of a Bear Phase

THE most striking aspect of the present securities market scenario is the contrasting behaviour of the two segments of the capital market—secondary and primary. Very briefly stated, the primary market has been displaying remarkable buoyancy whereas the secondary market has been distinctly subdued since about the beginning of the second week of July. Investors who have been avid buyers of shares/convertible debentures on offer in the primary market have either been keeping off the secondary market or figuring as persistent sellers.

After striking altogether new highs during June-end/early July, equity price indices started drifting lower. By about the first week of August, the *Financial Express* equity price index for Bombay had declined by 10.4 per cent and the all-India index by 11.1 per cent. During the same period, the BSE sensitive index registered a decline of 11.4 per cent and the national index moved down by 10.3 per cent.

In view of the preceding sharp upswing carrying most equity price indices to new all-time highs, technical considerations alone could have produced a decline of this order. But trading sentiment was also adversely affected by the vicious political atmosphere. Bears fully exploited the situation. Institutional purchases produced occasional rallies which could not be sustained due to corrective profit-taking, lack of follow-up support from the public and offerings by investors.

In the last week of August, however, the market staged a smart rally in the wake of substantial institutional buying which caused considerable anxious short covering and also induced renewed speculative support. By the end of August, the *Financial Express* index for Bombay had moved up by 5.1 per cent, retracing 43.7 per cent of the ground lost in the preceding decline. The retracing by the all-India index was 47.3 per cent. The BSE sensitive index moved up by 3.8 per cent from its August low, retracing 29.1 per cent of the ground lost in the decline from its all-time peak. The retracing by the BSE national index was 48.9 per cent.

With the outside public generally inclined to keep off the market and professional operators, who thrive on public money, also preferring to maintain a low profile in view of the uncongenial political weather, the volume of business shrank considerably. Bears had generally an edge over their rivals and the Calcutta and Ahmedabad markets had to put up with payments difficulties owing to heavy losses suffered by some big bull operators following the decline in prices.

Talking to a cross-section of the stock exchange fraternity—trading community and stockbrokers—the impression one gathers is that the stock market has lost its way in the thick fog of political uncertainty and that the market may have to live on a lean diet for quite some time as the uncertainty is likely to continue till the elections to parliament are out of the way. The confused political situation is not considered to be conducive to any significant improvement in the general market sentiment. The virtual absence of fresh investment inquiries and persistent offerings by investors have been interpreted by many as an indication of the erosion of investor confidence.

Such an assessment would seem to betray lack of proper perception on the part of the stock exchange fraternity of the fundamental factors affecting the outlook for equities and its obsessive concern about short-term fluctuations caused mainly by technical factors. It is one thing if investors keep off the market and resort to dis-investment selling because of a basic change in their assessment of the outlook for equities. But it is an altogether different matter if they are conserving and augmenting their cash resources for more profitable deployment of their funds in the primary market because of the favourable terms on which new and rights issues of shares/convertible debentures are being offered. Public response to new and rights issues is a far more reliable measure of the investment climate and investor confidence than the state of the secondary market which is known to suffer from occasional speculative excesses. Despite the regulatory framework evolved by the stock exchange authorities and the market's inbuilt self-adjusting mechanism for rectifying errors of excessive optimism and pessimism, the secondary market finds itself confronted at times with payments difficulties created by speculative excesses. More recently, both Calcutta and Ahmedabad have had a bitter taste of this.

The slide-down in equity price indices from their all-time highs is essentially in the nature of an important technical correction of the preceding sharp upsurge in prices. The decline has been orderly and quite normal—amplitude and durationwise. The overall behaviour of the market does not yet provide any convincing clue as to whether the month-end recovery marks the end of the corrective phase or it is only a minor rally. The process of technical adjustment can at times be quite painful and a long-drawn affair. And it could well be that the market is currently passing through such a phase.

Be that as it may, there seems to be no good reason to think that the current corrective phase would mark the end of the bull market and the beginning of a bear market. For fundamentals which have a bearing on the outlook for equities remain strong. Particularly relevant is the corporate performance which is highly encouraging. All studies point to an impressive increase in turnover, profits and dividends. Corporate investment activity for expansion, diversification, modernisation and new projects is at its all-time best. All the conventional economic indicators are pointing sharply upward, though balance of payments is undoubtedly an area of concern. The country has been blessed with another good monsoon, holding out the prospect of bumper agricultural harvest which will help spur industrial production. Investible funds seeking deployment in the equity market keep growing. Imagine UTI mobilising a record Rs 2,800 crore in July—the concessional offer period—which is Rs 600 crore more than the July 1988 figure.

No less significant is the growing awareness on the part of the government and the stock exchange authorities of the imperative need to expand and strengthen the infrastructural and organisational framework to provide more efficient service to the rapidly growing number of investors and protect their interests to promote the cult of equity. Several measures have already been taken in this direction and more are in the offing.

The Bombay stock exchange is implementing a Rs 10 crore automation project in association with CMC for accelerating the programme of modernisation. The Calcutta stock exchange has initiated steps to set up a stockholding corporation in association with the Canara Bank. Financial institutions and corporate boides are being asked to become members of the stock exchanges. Investment facilities under various equity support schemes have been liberalised. Serious attention is being paid to the problem of odd lots and to generating liquidity in listed securities. The Credit Rating Information Services of India (CRISIL) will soon start offering investors equity research information and information on companies.

Planning Commission member Abid Hussain has made a spirited plea for waiving of ceiling of foreign equity investment to promote foreign investment. Income-tax, wealth tax and gift tax Acts are being amended to lure NRI investment. The government has approved the creation of an over-the-counter exchange (OTC) under the Securities Control (Regulation) Act to protect investors from unscrupulous promoters of new companies. It is proposed to bring gradually under the OTC ambit all tradable securities in which investors are at a disadvantage in eliciting the right price.

All these measures are aimed at improving the investment climate. Little wonder that the primary capital market is forging ahead and public issues are evoking en-

thusiastic response. The spate of new issues with quite a few of them of really giant size (Rs 400 crore to Rs 820 crore)—each exceeding the total amount raised in a year until a few years ago—is an indication of the availability of investible funds, investors' confidence in the equity cult and promoters' optimistic assessment of business prospects. Unquestionably, the capital market has undergone a profound change over the past few years. Its growth has been phenomenal and the potential for further growth is immense.

It is, however, interesting to hear market men say that the mega issues which will be on offer in the near future are not strictly related to the financial requirements of the projects concerned and that they have a 'political content'. It is also worth noting how the promoters of the mega issues are resorting to all kinds of tactics to woo prospective investors. The view is widely shared that the subscription dates for the mega issues should be staggered to minimise their adverse impact on the secondary market.

The point can scarcely be over-emphasised that all mega issues need to be carefully appraised and monitored to minimise undesirable pre-emption of funds and to ensure the healthy growth of the corporate sector to better subserve national interests.

TEA

Shortage Threatens Exports

TEA prices in the domestic market have been surging week after week because of lower production this year, the Bodo agitation affecting the arrivals at auction centres and a firm trend in prices in overseas markets.

Though no official figures are available, according to industry and trade estimates, production by end August may be down by about 25 million kg at 400 million kg compared with the same period of the 1988 season. Almost the entire decline has occurred in south India. The carry-over stock from the 1988 season was almost nil. Since internal consumption of tea has been rising by a hefty 15 to 17 million kg a year and is expected to reach a level of 490 million kg this year, a situation of shortage is developing and prices are zooming. At 226.32 million kg the quantity sold in the Calcutta auctions between January and July this year is 25 million kg lower than that sold during the corresponding period of 1988. The all-tea average price realisation for the period January to July 1989 works out to Rs 31.34 a kg, up by Rs 7.50 a kg compared to last year. In recent weeks there has been a further big spurt in prices to Rs 40 per kg and more. At the retail level, even the most ordinary varieties of CTC teas are now priced around Rs 50 a kg.

In view of the rising prices in the domestic market, there is pressure on the government to cut tea exports. The commerce ministry has been resisting the pressure as the unit value realisation in overseas markets is high. At the same time, the government is worried about the continuing rise in domestic prices, particularly because this is an election year.

Tea production increased to 700 million kg in 1988 from 673 million kg in 1987 and 621 million kg in 1986. Going by the trend so far, production during the current year may not exceed 690 million kg. With domestic consumption accounting for 490 million kg and absence of carry-over stocks from the previous year, the quantity available for exports is expected to be only 200 million kg against the commerce ministry's target of 250 million kg. With rising prices in the domestic as well as international markets, tea companies are having a good time. This is reflected in the buoyancy in tea shares. Foreign buyers, including the Soviet Union, have been quite active at the Calcutta auctions during the last few weeks. This has pushed up prices significantly.

In a bid to check the runaway rise in prices, producers' associations have been asked by the Tea Board to send more supplies to the auctions. Warehouses have been instructed to send weekly reports to the board on arrivals of teas from the gardens. According to reports, the board is also considering the option of holding separate auctions exclusively for the domestic market. Trade circles feel that such a measure could help in bringing down the CTC tea prices by about Rs 5 per kg.

Another option suggested by major blenders (dominated by the multinationals) is that the country should import about 25 million kg of CTC tea for the domestic market so that it can export more of the high priced varieties without subjecting the consumer at home to continuous bouts of price increases. This way, it has been argued, the country would be able to maintain its export markets while protecting the interests of consumers at home. The tea producers' lobby, however, is totally opposed to this move for obvious reasons. They would like to make the best of the current unprecedented boom in tea prices.

While immediate steps are needed to check the rising tea prices, efforts are also called for to step up the growth in tea production in the coming years if the country is to maintain exports at 200 to 225 million kg per annum. Since the growth in tea production has not kept pace with the growth in domestic consumption, the exportable surplus has come down substantially over the last few years. At around 700 million kg, tea production in 1990 is expected to be well behind the Seventh Plan target of 760 million kg.

TWENTY YEARS AGO

EPW, September 6, 1969

Two years of labour to establish its findings appear to have so exhausted the Dutt Committee on industrial licensing policy that it went about gathering wool when it came to making recommendations for improving the licensing system... To stop altogether the growth of larger and foreign houses and companies would, in addition to demoralising and breaking up organisational teams, lead to production bottlenecks in the immediate future when the boom in economic activity, which everybody hopes for, would enlarge the demand for both capital and consumer goods... Again, while the committee is legitimately exercised over some large firms installing "capacity far larger than licensed and [producing] outputs much larger than the capacity licensed to them", it has not produced any solution which would do away with the mythical concept of capacity and replace it with operationally meaningful quantities like investment and foreign exchange allocation ...That the committee's thinking on controls was cast in an outdated pocket-sized mould (rather like the rajah of yore going round the village kingdom to see things for himself or the PWD overseer located at site) is clear from the manner in which it confidently recommends the appointment of directors by public institutions wherever financial assistance is extended by them.

* * *

By their agitated reaction to recent developments in the Congress, the other parties have once again acknowledged that Congress remains to be the centre-piece of Indian politics... There are the parties which are proceeding on the assumption that the split in the Congress, though not formal yet, is nevertheless real and see their future role mainly in aligning themselves with the one or the other of the Congress phalanxes... To Swatantra and Jan Sangh the split in the Congress is between nationalist-democratic elements and those who are either pseudo-communist or are bound to play into the hands of the communists... Also an exponent of a national front, but of 'progressive' forces, is CPI. The party's national council has emphasised the need to support the Indira Gandhi faction in Congress to prevent a "rightist takeover of power"... This leaves the SSP alone still clinging to all-out anti-Congressism which had its heyday just after the 1967 general election... It is of some interest that the one party with perhaps the most ambivalent attitude to recent developments is CPI(M). A lengthy statement adopted by the party's Central Committee in July claims that the party... refuses to believe that the threatened split in Congress is between "pro-monopolist and non-monopolist bourgeoisie"; at the same time it does not dismiss the crisis in Congress "as simply a factional quarrel" and affirms that CPI(M) is "vitally interested in inflicting a defeat on the Syndicate"... Here was CPI(M) once again trying, self-consciously but unsuccessfully, to sound different from CPI!

TATA TEA

Boom Continues

TATA TEA has established a pilot plant at Munnar for the production of button mushrooms and has commenced test marketing the produce. It is intended to set up a major export-oriented project in the future. Other projects in the pipeline include a spice processing centre at Cochin and a medicinal and aromatic plant processing centre at Munnar. The company also proposes to develop lands/estates which may form part of its business activities. The company has achieved sales of Rs 209.11 crore during the 15-month period ended March 1989 as compared to Rs 136.18 crore in the previous 12 months and earned a gross profit of Rs 28.62 crore against Rs 29.55 crore. Net profit is Rs 17.07 crore (Rs 11.05 crore). The directors have recommended a final dividend of 35 per cent on the capital enlarged by a two-for-five bonus issue which together with the interim of 15 per cent makes a total of 50 per cent as against 45 per cent paid for 1987. The quantum of dividend amounts to Rs 7.81 crore, an increase of about 55 per cent over the sum of Rs 5.11 crore paid for the previous year. The extension of the accounting year has involved the inclusion of the operations of two January-March quarters during which most tea companies, particularly those in north India, have hardly any production of black tea and expenses generally exceed income.

Total tea production was approximately 58 million kgs compared to the 1987 production of about 49 million kgs. The performance of the packet tea division showed further improvement. Plans are being finalised for setting up a new packeting centre in north India to cater to the demand from that area. Profits from export sales of packet teas also showed improvement. The company takes pride for the pioneering role performed by it in the growth and development of polybags which ensure garden fresh teas of good quality to the consumers at economic and fair prices. Following the lead given by Tata Tea in this regard, many other companies including established multinational tea packeters have come into the market with their own brands of polybags.

The company continued to be active in the areas of bulk and value added tea export to the US, UK, Europe, Iran and other Middle East countries. Very large export orders for the supply of bulk and packet tea to Iran have recently been entered into and negotiations are currently under way with other countries for undertaking similar business. The instant tea market in the US continued to shrink, exacerbating the already fierce competition which the company had to face from both US and overseas producers of instant tea. As a result, exports of instant tea to the US have shown a decline with a corresponding decline in margins and profitability. The company's earnings in foreign exchange amounted to Rs 34.31 crore inclusive of Rs 22.98 crore contracted for payment in rupees. Expenditure in foreign exchange was only Rs 89 lakh. The company has agreed to transfer the shipping agency affairs of P and O Containers to a separate company which has been floated by the latter so as to have full control over its agency affairs in India. Tata Tea will, however, be adequately and satisfactorily compensated for the loss of the business which it has built up over the last eight years.

TATA PRESS

Higher Profit Margin

TATA PRESS has fared better during 1988-89 with increase in sales from previous year's Rs 12.11 crore to Rs 14.95 crore and in gross profit from Rs 1.28 crore to Rs 1.79 crore. These figures also show enhanced profit margins. Net profit is Rs 83 lakh (Rs 70 lakh). Dividend has been stepped up from 18 per cent to 22 per cent and is covered 2.37 times by earnings as against 2.50 times previously. The company expects to maintain this trend in the current year.

Considering the distinct market trend towards four-colour printing, the management has decided to add one more such machine which will be imported and is expected to be operative in August/September this year. Following the amendments to the Companies Act, many large and medium size companies have chosen to opt for abridged form of reports to shareholders. The company is a leader in the printing of corporate reports and this has been a significant part of its business in the past. The directors, however, hope the amendments will not impair the company's results over the long term.

COLOUR-CHEM

Structural Changes

COLOUR-CHEM has earned a slightly lower gross profit of Rs 6.46 crore than the previous year's Rs 6.55 crore despite an 18 per cent increase in sales at Rs 86.16 crore against Rs 73.06 crore. Sizeable increase in material costs and the company's inability to increase prices to the extent warranted led to continuing squeeze on profit margins. Chronic shortages and uncertainty in the availability of many essential inputs, moreover, necessitated build-up of inventories, which increased carrying costs. With a saving in tax liability, after tax profit turned out to be a shade higher at Rs 3.02 crore (Rs 2.99 crore). The increased dividend of 22 per cent is covered 1.72 times by earnings as against 1.90 times previously. The company's export earnings during the year

amounted to Rs 10.87 crore FOB as against Rs 9.12 crore in 1987-88.

A far-reaching change in the company's structure has been initiated to reinforce its future prospects. Bayer and Hoechst have been the company's technical-cum-financial collaborators since its inception and each of them holds 16.4 per cent of its equity capital. Both collaborators have been examining ways and means of promoting the diversification of the company's activities and they have agreed that Bayer will transfer its shareholding in the company to Hoechst, subject to the requisite approvals of the appropriate authorities in India. B M Ghia, chairman, feels that the emergence of Hoechst as the sole collaborator of the company augurs well for the company's further development. The company and Tamil Nadu Industrial Development Corporation (TIDCO), who jointly promoted Vanavil Dyes and Chemicals (VDC), have agreed that the company will purchase 6,24,000 equity shares in VDC held by TIDCO at a price not exceeding Rs 25 per share. On completion of the proposed acquisition of this block of shares, the company's holding in VDC's equity will increase to nearly 51 per cent. The company could then induct additional resources and fresh technology for expansion and diversification at VDC.

Meanwhile, Colour-Chem's turnover during the first quarter of the current year has been 30 per cent higher than that achieved during the corresponding period of last year. But its Roha factory was severely damaged by heavy rains and flash floods which occurred on July 24/25. The chairman estimates the damage in the region of Rs 125 lakh to Rs 150 lakh.

BANK OF MADURA

All Round Progress

BANK OF MADURA's performance during the year ended March 1989 has excelled that in earlier years in many important respects. The bank's total deposits increased from Rs 260.39 crore in 1987 to Rs 299.55 crore at the end of March 1989, recording a growth of 15 per cent as compared to growth rates of 13.75 per cent and 11.57 per cent in 1986 and 1987 respectively. The bank's aggregate deposits (excluding bank deposits) rose from Rs 254.57 crore at the end of 1987 to Rs 297.01 crore at the end of March 1989, registering a growth of 16.6 per cent, as compared to the growth rates of 9.12 per cent and 14.66 per cent in 1986 and 1987 respectively.

With increase in the resources, the bank was able to attain a growth rate of 19.2 per cent in advances at the end of March 1989, when its total advances increased by Rs 31.09 crore from Rs 161.92 crore to Rs 193.01 crore. Advances had increased by Rs 6.65 crore in 1987. The average credit-deposit ratio which was 72.90 per cent in 1986 has been consciously brought down to 62.90 per cent at the end of March 1989 by augmenting resources through scientific planning, well-laid policy guidelines and specific marketing strategies. Advances to the priority sector which formed 35.60 per cent of total advances as at the end of 1987 rose to 39 per cent as on March 30, 1989. The bank is confident of reaching the goal of 40 per cent shortly. The turnover of foreign exchange business handled during the period amounted to Rs 246 crore as against Rs 127 crore in 1987. The volume of export and import business amounted to Rs 66 crore compared to Rs 48 crore during the previous year.

The period under review resulted in a net profit of Rs 127.28 lakh showing an increase of Rs 24.78 lakh. The rate of increase in profits was 24.18 per cent. But for the payment of Rs 1.15 crore towards arrears of wages, the increase would be 136.38 per cent.

The bank had a total number of 249 branches in March 1989. During the year four rural branches were opened. In June 1989 one metropolitan branch was opened at Kukutpally, Hyderabad. The bank's network now comprises 250 branches, of which 104 are in rural centres, 51 in semi-urban, 56 in urban and 39 in metropolitan centres. The bank has 42 per cent of its branches in rural areas all of which are in Tamil Nadu.

USHA RECTIFIER

Integrated Steel Complex

USHA RECTIFIER CORPORATION plans to invest over Rs 1,500 crore in setting up an integrated steel complex at Amethi un UP. In the first phase, involving an investment of Rs 711 crore, the company would set up a gas-based sponge iron complex with a capacity of 8,00,000 TPA of hot briquetted iron. The complex will include a captive 1.2 million tonnes iron ore pelletisation plant and a 60 MW gas-based power plant. The plant would use high grade iron ore fines from NMDC's Bailadila mines in Madhya Pradesh as raw material. The final product, hot briquetted iron (HBI) is a better substitute for steel melting scrap and is used by all mini steel plants and the integrated steel plants under SAIL. In fact SAIL has offered to purchase 3,00,000 TPA from the company on a long-term basis. The second phase of the complex would involve setting up of two 70-tonne electric arc furnaces together with the latest thin slab caster and a 5,00,000 TPA steckle mill to produce hot rolled coils. These facilities including expansion of HBI production would involve an additional investment of Rs 800 crore.

The total project would be financed through issue of fully convertible debentures totalling approximately Rs 700 crore which would be offered to equity shareholders, fully convertible debenture-holders and the general public. The terms for the issue are under finalisation by the Controller of Capital Issues.

Work on the project has already been started by Engineers India who have been retained by the company for detailed engineering, project consultancy and turnkey commissioning of the plant. The process technology would come from either MIDREX Corporation, USA (a subsidiary of KOBE Steel, Japan) or from HYL SA of Mexico.

The company is negotiating with Voest Alpine of Austria and Lurgi GmbH and MAN-GmH of West Germany for the supply of plant and machinery.

Usha Rectifier's existing operations are also doing extremely well. The company achieved a turnover of approximately Rs 50 crore in the first six months of the current year and is expected to reach a turnover of Rs 120 crore by the year-end. Profit after tax was Rs 5.86 crore for the first six months and is expected to be around Rs 14 crore for the full year. The company's Bimtal operation has started production and the company is already in the market with its TV kit components. The company is a leader in the electronic semiconductor industry and supplies to almost all the major clients in the country.

IN THE CAPITAL MARKET

Essar Gujarat

ESSAR GUJARAT is entering the capital market on September 18 with a convertible debenture issue of Rs 400 crore. Out of this, Rs 137 crore will be offered to existing shareholders of the company on a rights basis. Out of the balance, Rs 54 crore have been reserved for allotment to group companies and employees and Rs 69 crore for allotment to NRI investors. Debentures of the value of Rs 145 crore are to be offerd to the Indian public. Each debenture offered to the public will be of the face value of Rs 180 and will be converted in two stages, in June 1990 and June 1992, into four equity shares at an average maximum price of Rs 45 each. Essar Gujarat shareholders are to be offered a minimum of three debentures for every ten shares held on a rights basis. Each debenture will be of the face value of Rs 200 and will entitle the shareholder to five shares on conversion at a maximum average price of Rs 40 per share. Essar Shipping shareholders will be given a minimum of 10 debentures from the quota reserved for group companies at a price of Rs 180 per share. The proceeds from the debenture issue will part finance Essar Gujarat's proposed export-oriented steel plant with a capacity of 8 lakh tonnes per annum. The debenture issue is notable for the frills which have been added on to it. These include: (1) Arrangement with some banks to provide loans for payment of allotment money repayable over a maximum period of three years. (2) Arrangement with three nationalised banks—Andhra, Central and Canara—to enable use of their credit cards by applicants for the debenture issue. (3) Issue of a tradable warrant with every debenture entitling the holder to apply for an equity share at any time between the fourth and fifth year from the date of allotment at a price to be determined by the Controller of Capital Issues but not exceeding Rs 70. The warrant is proposed to be listed with stock exchanges to permit tradability. (4) Issue of a 'loyalty coupon' of Rs 10 with each debenture as an incentive to shareholders who retain their shares after two conversions for three years from the date of allotment of the debenture. The company is also simultaneously offering 14 per cent secured non-convertible debenture of Rs 100 each for a total value of Rs 100 crore. The non-convertible debenture issue will open on November 8.

Larsen & Toubro

LARSEN & TOUBRO's convertible debenture issue of Rs 820 crore will open on October 4. Out of the proposed issue, debentures worth Rs 200 crore (inclusive of Rs 9.5 crore reserved for employees) will be offered on rights basis. Shareholders will be offered additional debentures worth Rs 60 crore on preferential basis. Similarly, holders of L & T debentures of Series III will be offered debentures worth Rs 50 crore on preferential basis. Of the balance, debentures worth Rs 310 crore will be offered on preferential basis to shareholders of Reliance Industries and Reliance Petrochemicals. The face value of the debenture is Rs 300 (Rs 290 in the case of the rights issue) which will be converted into five equity shares. The first conversion will be at the end of six months, the second at the end of 18 months and the third at the end of 30 months from the date of allotment. The premium for the first conversion will be Rs 30 per share for shareholders under the rights issue and Rs 40 for others. The second conversion will be at a premium of Rs 50 and the third will be at a premium as determined by CCI, not exceeding Rs 55 per share.

Su-Raj Diamonds (India)

SU-RAJ DIAMONDS (INDIA)'s rights issue opened on September 1. The rights issue comprises 50,15,115 equity shares of Rs 10 each at a premium of Rs 40 per share aggregating Rs 25.08 crore, which includes 5 per cent reservation for employees/working directors. The object of the issue is to augment the long-term resources for expansion of the company's business. The issue, which will close on September 30, is structured so that Indian residents have to invest only Rs 25 (Rs 5 towards share capital and Rs 20 towards share premium) immediately and an equivalent amount around April 1990. Meanwhile, liquidity will be ensured since these partly paid rights shares will be separately listed on the Bombay, Ahmedabad and Delhi stock exchanges. The Su-Raj group, which is amongst the leading manufacturers and exporters of cut and polished diamonds from India, is implementing a project for installation of approximately 960 sawing machines at Jodhpur which will make it one of the largest sawing factories in the world. The project is at an advanced stage and is expected to be commissioned shortly. The company has pioneered the introduction of the technology for 'sawn' diamonds in India. The company has turned out encouraging results for the 11-month period ending March 31, 1989, with turnover at Rs 72.61 crore as against Rs 51.08 crore in the previous year, representing an increase of 55 per cent on an annualised basis. Profit after tax, which increased from Rs 4.34 crore in 1987-88 to Rs 6.29 crore in 1988-89 (11 months), also showed an impressive growth of 58 per cent on an annualised basis. Dividend has been hiked by 5 points to 20 per cent (annualised). Earning per share, which stood at Rs 9 in 1987-88, grew to Rs 14.4 on an annualised basis in 1988-89. The company's estimated turnover for 1989-90 is in the region of Rs 130 crore. For the first quarter of the current financial year exports totalled Rs 27 crore as against Rs 13 crore in the corresponding period of the previous year. The company commissioned a modern automated jewellery manufacturing unit at SEEPZ in 1988-89.

Quality Steels and Forgings

QUALITY STEELS AND FORGINGS is making a public issue of 18 lakh equity shares of Rs 10 each for cash at par aggregating Rs 1.80 crore. The issue is intended to provide part of the finance for the company's technology upgradation, expansion and diversification programme. The company is installing at its steel melting plant in Kalal in Panchmahals in Gujarat secondary metallurgical treatment facilities to give the cast steel substantially higher strength and to render it free from harmful gases and non-metallic inclusions. The company is also setting up its own forge shop which will enable it to transfer hot metal and thereby conserve fuel and increase realisation. As part of diversification, the company proposes to set up a separate ferro-alloy plant at Meghnagar in Madhya Pradesh. The public issue will open on September 27.

NOTICE

It is hereby notified for the information of the public that McDOWELL & CO. LTD., propose to make an application to the Central Government in the Department of Company Affairs, New Delhi, under Sub-Section (2) of Section 22 of the Monopolies and Restrictive Trade Practices Act, 1969 for approval to the establishment of a new undertaking as a division of the Company. Brief particulars of the proposal are as under:

1. Name and address of the owner of the undertaking	:	McDOWELL & CO. LTD. Le Parc Richmonde 51, Richmond Road Bangalore 560 025
2. Capital structure of the applicant organisation	:	Equity / Pref (Rs. Lac) Authorised: 1500 / 88.80 Issued & Fully-Paidup: 768.25 / 9.48
3. Management structure of the applicant organisation indicating the names of the Directors & Manager, if any	:	a. Mr. Vijay Mallya b. Mrs. Ritu Mallya c. Mr. S.J. Kaul d. Mr. M.P. Talwar e. Mrs. Lalita Mallya f. Mr. D. Basappa g. Mrs. Prema Mallya h. Mr. B.P.R. Sarcar
4. Whether the proposal relates to the establishment of a new undertaking or a new unit/division	:	New Unit, as a division of the Company.
5. Location of the new unit	:	Chindwara or Datia Districts Madhya Pradesh
6. In case the proposal relates to the production/ storage, supply, distribution, marketing or control of any goods, articles, indicate:		
a. Names of the goods/articles	:	Potable Alcohol
b. Proposed licensed capacity	:	50 Lac Litres/Annum
c. Estimated annual turnover	:	Rs. 67.50 Crore
7. Capital structure of the proposed undertaking	:	The proposed undertaking will be a unit of the applicant organisation and therefore will not have a separate capital structure.
8. In case the proposal relates to the provision of any service, state the volume of activity in terms of usual measures such as value, income, turnover etc.	:	Not Applicable
9. Cost of the project	:	Rs. 16.57 Crores
10. Scheme of financing, indicating the amounts to be raised from each source	:	Partly from Internal Accruals and the balance by raising Loans and Leasing.

Any person interested in the matter may make a representation to the Secretary, Department of Company Affairs, Government of India, Shastri Bhavan, New Delhi 110 001, within 14 days from the date of publication of this notice, intimating his views on the proposal and indicating the nature of his interest therein.

Calcutta Diary

A M

The innocent millions, whose formal votes have been instrumental for the sustenance of India's ruling dynasty till now, have to be weaned away from their loyalty to the concept of advaita. *The first blow for Enlightenment, the necessary condition, one could say, is to dismantle the belief that the dynasty, this* particular *dynasty, has the divine, eternal right to rule India and that, without its benign presence, the nation is bound to collapse.*

HARYANA is next door to the nation's capital. Even more relevant, it is quintessential Aryavarta. The cultural norms prevailing there could not be more reassuring: never mind you and I being less than a dozen years away from the twenty-first century, the Dark Ages are for ever. Sons take it as their natural right to indulge in outrageous activities on the strength of political offices held by fathers. Sons-in-law, erstwhile no-good vagabonds, emerge overnight as billionaires. Daughters-in-law die from mysterious gunshot wounds. Amendments are suggested to the Hindu Succession Act to prevent married daughters from enjoying a share in parental property. Arguments to justify such behaviour and attitudes bear the common pattern of crudity already made familiar by legislators from the northern plains, operating under the benign guidance of Shankar Dayal Sharma and Balram Jakhar, in the august parliament. Between those ranged on this side of the political divide and that side, there is, as far as public conduct goes, hardly any noteworthy difference. They represent the quality of *avyaya*—the aspect of both immutability and indestructibility—of Indian non-civilisation. The stupendous experiment with democracy in the country, the hurly-burly of it, they take to be an extension of the tussles over feudal inheritance in which they are particularly at home. The age of feudalism is, for them, by no stretch over. They are very much living in it, savouring its delights with every pore of their existence. The current goings-on therefore add up to theatre with a split image: on the surface, the inexorable forces of democracy are on the march; below the surface, the skulduggery of olden days renews itself every hour on the hour, on all days in the week, in all weeks of the month, in all months of the year.

This is where apologists for the regime-that-be in New Delhi bestir themselves. While outwardly a sophisticated lot, they in fact have been able to put little distance between their natural crudity and their cultivated airs. Since the Devi Lals, so their plea runs, are no improvement over what we have been offering you, why bother to change? The argument soon drifts into the familiar known-devil-*vis-a-vis*-the-unknown-one claptrap. Attention is drawn to the incidental advantages they—the present crowd—can ensure. For instance, certain external economies flow from the fact of having foreign in-laws; one is, willy-nilly, forced to get involved, or take an interest, in happenings elsewhere in the world; once the public school ethos is substituted by the Haryanvi coda, only factors affecting the Holstein breed are likely to determine the country's international relations, nothing else will matter; be sensible, you cannot allow that kind of thing to happen to your nation, why not stay with, let us say, Pietco.

The danger, let it better be confessed, is real. In case, following the coming Lok Sabha elections, the dynasty collapses and the alternative crowd takes over, there could indeed be a retrogression in one or two socially crucial areas; new versions of Raj Narains might begin to show their face, a denouement one does not greatly look forward to. On a balance of considerations, however, it might still be desirable to opt for a change. The medieval mind is a formidable corpus. It has entrenched itself over the centuries. It would not obligingly disappear merely because the electorate chose to vote in a particular manner in a particular season. Precisely on account of that, it might make sense to compartmentalise the problem and combat what has to be combated bit by bit. Much can be said, for example, in favour of assigning priority to the task of demolishing the myth of indestructibility of the 'royal' household. The Devi Lals are, as the cliche goes, no great shakes. In some matters they would indeed try to drag us into darker chambers of medievalism. At least in the present context, though, the Leninist edict of moving one step back in order to proceed two steps forward has a major significance. In the dens and jungles of the northern states, there are princes galore, many of them belong to the old families, a few have come up in the course of the past quarter of a century as a consequence of the new agricultural strategy. Once the dynasty falls, some of them are bound to try to push themselves to the front, and one or two amongst them are likely to succeed, even if temporarily. They, there is no question, would not be any great improvement over the dynasty. They might even nurse the ambition to set up dynasties of their own. But at least these would not be the *same* dynasty. The innocent millions, whose formal votes have been instrumental for the sustenance of the dynasty till now, have to be weaned away from their loyalty to the concept of *advaita*. The first blow for Enlightenment, the necessary condition, one could say, is to dismantle the belief that the dynasty, this *particular* dynasty, has the divine eternal right to rule India and that, without its benign presence, the nation is bound to collapse. The awareness that reality can have a different texture from what All-India Radio and Doordarshan have conditioned them to is a gain which, in the present circumstances, is impossible to assess in terms of conventional weights and measures. It is worth suffering all the obscenities a phase of the Devi Lals might inflict provided the electorate could be persuaded to get used to the idea of an India surviving even without the dynasty. The sense of wonder, accompanied by a sense of self-assurance likely to be experienced would be comparable to what the young brat feels the first time he balances himself on the bicycle without leaning on the handle-bar: look mom, no hands; look, we are without the dynasty and yet we have not collapsed.

True, at this stage, other logic-choppers might intervene. Have we not been here before, did not we get rid of the lady a little over a dozen years ago, the dynasty did not however disappear, the country's millions needed the dynasty, which had enough resilience to bounce back, and in about two and a half years, history was restored to where it belonged; what gives you confidence that, even assuming that you succeed a second time to eject the dynasty, it would not stage a come-back taking advantage of the faction fights amongst the Pindaris? Whether the Indian nation needs the dynasty as much as it needs air and water to survive is a proposition which cannot be independently tested in a laboratory; it is a matter of value judgment and therefore beyond the pale of debate. One might also brush aside the implications of the adage once-bitten-twice-shy, whichever way it is interpreted. Even so, a qualitative difference exists between the situation obtaining twelve years ago and what obtains now. The lady was a one hundred per cent political animal, tough, single-minded in the pursuit of targets and totally ruthless; following her defeat, she made it her business to chart a course which would pave her triumphant return within a space of a bare few years. The lady's son, in contrast, continues to provide the impression that, while he much enjoys the regalia of power, he is innocent of the art and artefacts of political battlement. Once he is dislodged from the throne, he might simply decide to call it quits, without bothering in the least about the fate that might overcome the party he presides over. The exercise of royalty can of course be habit-forming, and the temptation to return to power and glory might still instil a kind of ferocity in the person which was not there earlier. But ferocity by itself is likely to prove to be small change. In order to withstand the buffetings of for-

une and reclaim the kingdom, it would, in he first place, be imperative to retain the oyalty of the servitors. Given the son's rather indifferent record of electoral performance over the five years of his reign, should he in addition be at the receiving end of a huge drubbing in the national polls due in the winter, the erstwhile retainers might arrive at their own conclusion, namely, the triumph in December 1984 was exclusively on account of the burning embers of the mother's funeral pyre; since funeral pyres are not for ever, there was little point in not shifting their loyalty.

Once that realisation establishes itself, the *advaita* cult would receive the final *coup de grace*. In the liberalised environment, dynasties would then begin to compete with one another. To be fair, some of these dynasties might be even more greatly in love with the Dark Ages than the present one is. That, let it be agreed, would be retrogression. On the other hand, the people would have come to the knowledge that no dynasty was for ever, and, besides, it was given to them to topple an entrenched one. At that stage, even such ideas might threaten to sprout that all dynasties, new and old, deserve to be dumped into the dustbin of history. *That* would be no retrogression, but progress. Sometimes events crawl, sometimes they unfold without seemingly conforming to any logical system, something they turn upon themselves. The sum total of such happenstances still constitutes that grand, magnificent process we call history.

POTOMAC MUSINGS

The Last Laugh in Afghanistan

Deena Khatkhate

The Americans saw in Afghanistan a replay of their own trauma in Vietnam, only this time the victims would be the Russians. And it almost happened that way—almost but not quite.

FIFTEEN years have gone by and yet very few have known about what exactly happened in Vietnam that destroyed first the American armour, then the American army and finally this greatest nation's self-confidence. America had all the resources, all the manpower, all the support of its allies, but all in vain. They came a cropper; scapegoats were sought and also found. The media played foul, the students rioted, the draft dodgers' ranks swelled, liberalism sapped the very vitality of the nation. Hence America must go back to its roots, the roots of its bravado, its cruelty, its predatory onslaught on the Indians to make a nation. And when the memories of the ignominy were about to fade, there came the adventure of Brezhnev's Russia which sent its army of over a hundred thousand men into Afghanistan. At last the Americans were gleeful. The same Russians had been smiling in their sleeves at the US predicament in Vietnam and now they would meet their Vietnam in Afghanistan. Before their minds' eyes, the whole traumatic saga of Vietnam resurged, only that this time the Russians would be the victims and they the gloaters.

And it almost happened that way. The Russians got sucked in till there arose a new star, Gorbachev, on the Russian firmament to announce the Russian withdrawal. Though superficially, the Americans greeted the news with a sense of relief, deep down they wished for a Russian debacle. Aren't the Afghans great fighters? They would be on the Russians' trail. While the Russians were retreating they would be stewed in their own juice—as the Americans were, in the final hours of the Vietnam war. The tales of wishful thinking went on long into the Arabian nights.

The deadline of February 15, 1989 came and has gone. The Russian army is back in Russia and in the barracks. But the expected denouement has not come about, disappointing the Americans. The fib was floated that Najibullah's government would collapse the moment the Russians were gone. Were not the Russians defeated as the Americans had been in Vietnam and if Americans had been trounced why would not the Russians be? Are they superhuman? The Mujahideen are strong, armed and supported by American dollars. But lo and behold, the Russians are out, but Najibullah is still there, deeply entrenched, even stronger than before and smiling with the newly-acquired confidence of a victor. Mujahideen are banging their heads on the outer walls of Jalalabad, with their noses rubbed in dust and the rotting flesh of their dead comrades all around.

Hyperbolic reportage in American papers about the heroic struggle of the Mujahideen, day in and day out, has destroyed the credibility of the so-called free press of the free world. The reports were managed by the American administration and the governments of the other western countries in no way differently from the way the Indian press is. Blind anti-communism and self-serving analyses of Russian motives led them up the garden path, with made-up stories about the valour and bravado of the Afghan guerrillas. When the Najibullah regime survived for three months after the Russians' withdrawal, the truth began to emerge. The people here, as elsewhere, had been taken for a ride by the press and the western governments. The same press is now providing different tidings. Najibullah's party, the PDPA, is "now stronger than was supposed and it has indeed a strong base in cities and an inde-terminate amount of support throughout Afghanistan". The Russians had left not because they had lost the war but because of a shift in their geopolitical strategy with Gorbachev's ascendancy. Russians has reached the point of what Paul Kennedy would describe as "imperial overstretch". It can no longer follow hegemonistic policies internationally unless it resolves its internal social tensions, reforms its productive apparatus and provides outlets to the people for articulation of their aspirations and hopes. In this grand power game Afghanistan is a small change. True, the Russians did not cover themselves with glory in their Afghan occupation, but neither were they vanquished by the guerrillas armed by the Americans. In the Russian calculus the gains of exit are far in excess of the losses. There was thus no question of the Russians meeting their Vietnam in Afghanistan. Russia knows, as Americans and the world know, that Afghanistan cannot and would not remain beyond the pale of Russian influence. Geopolitical factors would never permit it.

What about the so-called brave Mujahideen? They are riff-raff drawn from squabbling and warring tribal communities. They have used American money for opium traffic and arms to mutilate and murder their own people more than the enemy. Selig Harrison, who is a pariah now in the American political arena, has been hammering home the point for months that the US government knows very little about the regime it has been seeking to overturn for so long and that the American press has fed the public cock and bull stories. He has produced the most damaging evidence about the American press. He has disclosed that "those few US journalists who got as far as Kabul and had the backbone to controvert received wisdom had their copy either rewritten or cut to ribbons. Most journalists just sat in the Intercon in Peshawar and did nothing." He knew of one journalist "who was eating his dinner when he was asked to file a story urgently to New York. He went out and made up completely phony footage."

The cozenage was not confined only to the realm of newspaper reporting but extended to portraying the Mujahideen as a patriotic band of Afghans, yearning for the liberation of their land. That they were the satanic errand boys of Khomeini was veiled, that they were a pipeline for heroin transmission to the western countries was pigeon-holed, that they perpetrated the most heinous kind of crimes and atrocities on their fellow countrymen was swept under the carpet. Now everything has come out in

the open. Thousands of prisoners were mutilated and women raped. Raza Anwar, an Afghan not by any means a friend of Najibullah, has written in his book that "to the Mujahideen it is the observance of Islam itself to torture and mutilate the bodies of captured rebels". There have been several defections from the ranks of the Mujahideen to the Afghan government, repelled by the cruelty of the rebels. By just being Najibullah's enemies, the Mujahideen increased the ranks of the friends of the regime. Shrewed as he is, Najibullah skilfully exploited the dark side of the rebels to prove his bona fides. He also offered blandishments to co-opt different tribal leaders in the government, destroying the unity of the Mujahideen. Afghan society was never homogeneous; it has been always fractured with myriad tribal loyalties. With the passage of every day, the Najibullah regime is gaining sustenance and the hopes of Pakistan and America of toppling at are receding.

At the best of times the Americans are loath to remove their blinkers and the situation is now worse. They are still wedded to the belief that the Russian-backed government in Afghanistan will collapse and therefore they have turned their backs on a negotiated settlement. But Benazir Bhutto's Pakistan cannot afford that luxury. With so much on her plate, Benazir Bhutto wants to back out from the American policy and end the Afghan imbroglio. She does not want the Afghans to believe that they have traded one type of invader for another. A retreat now will be a victory later. Will the Americans oblige? Till then, Pakistan and Afghanistan will stand on the edge of a precipice. The Americans will see their greenbacks vanish in the valleys of Afghanistan, will provide arms to Afghans to kill Afghans and in return will get the dreadful of scourge of heroin destroying American youth. In the furrows on the Gorbachev's forehead at the time of the signing of the Afghan agreement, the Americans may have discovered the image of their own fate in Vietnam. Gorbachev did not laugh then, but he may be doing so now. Did they not say, those who laugh last laugh best?

CIVIL LIBERTIES

Maps and Freedom of Speech

A G Noorani

The bill introduced in the Rajya Sabha by the home minister early last month to amend the Criminal Law Amendment Act, 1961 making it "an offence per se *to publish a wrong map of India" is clearly unconstitutional.*

IS it not open to a citizen to assert where, in his opinion, the boundaries of his country ought to be—whether on grounds of history, morality, law or expediency? Is the right limited to words or does it extend to expression of opinion through maps as well?

On August 1, the union home minister, Buta Singh, introduced a bill in the Rajya Sabha which seeks to amend section 2 of the Criminal Law Amendment Act, 1961 by inserting two provisions. Under one publishing of maps which do not conform to those prepared by the Survey of India will be an offence punishable with a fine or six months' imprisonment or both. The other provision makes such offences cognisable only on a complaint by the government.

The statement of objects and reasons attached to the bill says:

> Publication of wrong maps of India depicting incorrect boundaries of the country amounts to indirectly questioning the frontiers of India and its territorial integrity.
>
> Certain measures were taken to ensure that correct maps of India were published. In 1986, instructions were issued to all state governments and union territories to see that publishers get their maps vetted by the Survey of India before publication. It was decided later that the Survey of India would make available on 'free sale basis' the outline maps of various scales and the publishers who utilise them as base for their maps would not be required to get their maps vetted by them.
>
> Where maps were required to be prepared on scales other than those on which outline maps were available, the publishers were required to get them vetted by the Survey of India.
>
> In spite of these measures, instances of incorrect depiction of external boundaries of India by private agencies, newspapers and so on continued to come to notice.
>
> With a view to discourage the tendency to publish wrong maps of India with impunity, it was considered necessary to make it an offence, *per se*, to publish a wrong map of India.

This is the draconian effect of the bill. It does not make intent or *mens rea* an ingredient of the offence. It will be "an offence *per se* to publish a wrong map of India". And what is a 'wrong' map, pray? One which does not conform to those published by the Survey of India. Reason? Publication of such maps *"amounts to indirectly* questioning the frontiers of India and its territorial integrity".

By now quite few studies by Indian writers have appeared which question India's claim not only to the Aksai Chin but, as the late Karunakar Gupta did, even to the McMahon Line. Would Gupta have been sent to jail if he were to publish his views through a map or if he were to publish a map to illustrate his views?

It is clear that the proposed amendment would be unconstitutional. Article 19(2) of the constitution empowers the state to impose only "reasonable restrictions" on the fundamental right to freedom of speech and expression "in the interests" *inter alia* of "the sovereignty and integrity of India". How can a non-conformist map be said to "amount to indirectly questioning" the country's territorial integrity?

Section 2 of the Criminal Law Amendment Act, 1961 as originally enacted was stringent enough: "Whoever by words either spoken or written, or by signs, or by visible representation or otherwise, questions the territorial integrity or frontier on India *in a manner* which is, or is *likely to be* prejudicial to the interests of the safety or security of India, shall be punishable with imprisonment for a term which may extend to three years, or with fine, or with both." There was a small concession in that the likelihood of harm was an ingredient of the offence.

There came the Unlawful Activities (Prevention) Act, 1967 which penalised anyone who advocated "the cession" of a part of India even if it be in the country's best interests—the Katchativu islands ceded to Sri Lanka, for instance. Also punishable is one who "disclaims or questions the sovereignty of India in respect of any part of the territory of India".

The white paper on Indian states published by Sardar Patel in March 1950 as well as its previous edition of 1948 showed the boundary in the Aksai Chin area as not "undemarcated" or "undefined". Would that be an offence now? Evidently, yes.

However, section 13(3) of the act of 1967 excludes from its scope an agreement entered into by the government of India with a foreign government as well as "negotiations therefor carried on by any person" authorised by the government. A citzen who advocates the cession of Aksai Chin or who draws a map on the lines of the 1950 map can be sent to jail. The prime minister or the minister who signs a boundary treaty with China which provides for such cession is protected. So are the officials who embark in the "negotiations". A law which imposes such nonsense to silence dissent cannot be accepted as a reasonable restriction on the right to freedom of speech.

Command Performance by Planning Commission

BM

The Eighth Plan Approach Paper has been designed for the Congress(I)'s electioneering purposes. It cannot be taken as a serious step in the planning process.

THE Approach Paper on the Eighth Plan has been adopted by the full Planning Commission. According to the time-table indicated by the prime minister, the paper will be presented to the union cabinet in the second week of September and it goes without saying that it will be approved without much ado. It is, of course, always likely, considering the wayward manner of the prime minister's working, that the approval by the union cabinet may be stalled for some time. There was considerable dithering by the prime minister before he could be persuaded to go through with the formality of holding a meeting of the full Planning Commission under his chairmanship to adopt the Approach Paper. This was not because there could be any problem with the minister-members of the commission raising any awkward questions. Once the prime minister had given his nod of approval at an informal meeting with the official planners, there could be no such problem and the ceremonial adoption of the Approach Paper by the full commission went through smoothly. The union cabinet can be expected to behave no differently. The reluctance of the prime minister to endorse the Approach Paper for some time after it had been drafted by the planners in Yojana Bhavan seems to have been inspired by the idea planted by some faceless adviser that a pre-election public debate on the Eighth Plan may not suit the exigencies of the ruling party's electioneering which has been geared wholly and stridently to populist slogans and postures. It seems to have been argued that questions might be raised and doubts cast on the feasibility of the planned targets and the government's ability and willingness, considering its economic and social policy preferences, to realise the promises being made. But another set of advisers seem to have argued and apparently convinced the prime minister that the Approach Paper with its string of dazzling targets might actually make available to the ruling party and its publicists, advertisers and propagandists some additional talking points for his election campaign. The prime minister himself is so much under the spell of his publicity men and advertisers and the official media machine that he is unable to comprehend that the effect of their labour is often negative and counterproductive when achievements and claims are advertised and tall promises made which fly in the face of reality and known facts and, therefore, carry little conviction or credibility. This has been sharply spotlighted by the Bharat Bandh. Large sections even in the ruling party have actually begun to question the efficacy of mindless publicity and advertisement campaigns. This has relevance as much to the Approach Paper and the targets it flaunts as to the policies and promises bandied about by the government and in particular the prime minister himself.

So far as the planning exercises are concerned, even after the adoption of the Approach Paper by the full Planning Commission large holes in it remain uncovered. The critical macro-economic parameters it projects are still uncertain and undecided. The prime minister himself is still not happy with the growth rate target of 6 per cent and his hang-up with a higher growth rate persists. He could be persuaded by the sober advice of some of the planners to endorse the target of "at least" 6 per cent with the rider that it could be improved upon "through better management and efficiency". At the same time, some of the compelling issues relating to the feasibility of even the projected 6 per cent growth rate have been simply evaded. The question of the rate of savings and hence the investment required in the Eighth Plan has not been clinched. The assumption that the incremental capital-output ratio (ICOR) would be 4.15 per cent in the Eighth Plan compared to 4.3 per cent as has been calculated with much ingenuity for the Seventh Plan has also been kept aside for later consideration.

MOUNTING DEBT

It may be presumed that when and if the union cabinet is called upon to rubber-stamp the Approach Paper, the position with respect to such 'minor' matters as the saving rate and the ICOR will be settled to the satisfaction of the political bosses. The required expertise is, after all, available in Yojana Bhavan for such purposes. The experts can be relied upon to juggle statistics if necessary. All that has to be done is to shift the base line or the time-frame to arrive at figures which look nice and desirable. The new series of indices have come handy in recent times to dress up the rates of industrial growth, price rise and national income generation. The revised national income series shows a comfortable hike in the growth rate achieved in the Seventh Plan and this has also helped to show a decline in ICOR to 4.3 per cent. The inflow of foreign savings in the Seventh Plan has also been scaled down from 2 per cent of GDP as earlier calculated to 1.8 per cent. The inflow of foreign savings has been assumed on this basis to be 1.6 per cent of GDP for achieving a growth rate of 6 per cent in the Eighth Plan as compared to a growth of 5.4 per cent in the Seventh Plan. But the planners have evidently not been able to project such glad tidings on several other counts for the Eighth Plan. It is, after all, not possible to throw all caution to the winds. The union finance ministry, it appears, has also exercised a sobering influence on the prime minister as well as the 'high-flyers' among the planners in respect of the resources, domestic and foreign, which can be mobilised for the Eighth Plan.

In the face of the large external and internal debt piled up during the Seventh Plan, the finance ministry had to caution that the projection of a growth target of even 6 per cent would give rise to ticklish problems in financing the Eighth Plan, especially its public sector component which is proposed to be of the order of Rs 3,50,000 crore at 1989-90 prices. With the domestic saving rate hovering at around 20 per cent of national income, the calculations show that dependence on foreign savings may well go up to more than 2.6 per cent of GDP (compared to 1.8 per cent calculated for the Seventh Plan) for financing the Eighth Plan to achieve the postulated growth rate, let alone improve upon it. That will, however, be a sure way of walking into the foreign debt trap. The idea that foreign savings of the order of 2.6 per cent of GDP will become available is also facile and fanciful. It is not a question only of the stiff conditions which are bound to be attached to the inflow of foreign resources on this scale. The fact also is that foreign savings on this scale may simply be not available whatever policies may be adopted by the government to attract foreign savings. It is, however, argued in this context that the average rate of domestic savings would be stepped up from 21.1 per cent to 23.3 per cent of GDP. This implies an increase in the marginal rate of saving to over 33 per cent. This is not beyond the capacity of the people of India to achieve. But considering the profligacy of the ruling establishment, the inefficiency of big business and the wild consumerism which has been recklessly promoted among the upper and middle classes by official policy more brazenly since the mid-eighties, the savings target cannot be achieved except by brutal intensification of exploitation of the working people. This has its own implications—economic, social and political. Some fresh

work also seems to have gone into the savings rate calculations. Earlier, the savings rate was calculated to be 21.4 per cent of GDP in the Seventh Plan and it was proposed to be stepped up to as much as 24.1 per cent which required that the marginal rate would have to go up as high as 39 per cent. The question of a sharp increase in the tax ratio from 16.9 per cent to as much as 20 per cent of GDP too has not been squarely faced in this context. The growth target for exports which has been scaled up to 12 per cent in volume terms to meet the foreign exchange requirements of the plan is not only unrealistic but also has implications which have been evaded.

EMPLOYMENT SCENARIO

The Approach Paper promises an employment growth rate of 3 per cent. An official spokesman of the Planning Commission has smugly proclaimed that this would be faster than that achieved in recent years and in any case faster than the growth rate of the labour force. But how exactly this growth target which has a close relevance to the proclaimed objective of satisfying the basic needs of the people is to be achieved has not been spelled out. The same promise was made in the Seventh Plan and has not been realised. On the contrary, unemployment and under-employment have grown at a faster rate during the Seventh Plan than before and even existing, relatively gainful, employment in organised industry, the large services sector and commercial agriculture has declined during the Seventh Plan period. In this context, the claim of the official spokesman of the Planning Commission that Eighth Plan would "build on" the experience of the Jawahar Rozgar Yojna is disconcerting. For this shows that the planners and their political masters are either wholly devoid of any understanding of the problem of generating gainful and productive employment in the economy or they are engaged in cynical deception of the people. The generation of opportunities for gainful employment, after all, is not possible by juggling financial allocations for special employment programmes. The large leakages of funds apart, such devices can only touch the fringes of the problem. For any meaningful employment-oriented policy to give results, it is imperative that labour-intensive peasant farming, handicrafts, rural industries and small-scale enterprises are preserved and promoted. The market-oriented, capital and import-intensive modernisation policy which is being pursued by the government cannot but aggravate the unemployment problem.

A target as deceptive as the one set for employment in the Approach Paper is that for poverty alleviation. It is claimed that the percentage of the population below the poverty line would be brought down by 10 per cent, from 28-30 per cent by the end of the Seventh Plan to 18 per cent. The calculations that have gone into 'bringing down' the percentage of the population below the poverty line to 28-30 per cent at the end of the Seventh Plan are bound to be challenged by competent experts as similar claims have been challenged in the past. It was claimed when the Seventh Plan was drawn up that the percentage of the population below the poverty line had come down to 41 per cent in 1981-82 and further to 31 per cent in 1985. It was planned to bring this percentage down to 21 per cent, exactly by 10 per cent, as is now being proposed for the Eighth Plan. However, the Approach Paper now admits that those below the poverty line at the end of the Seventh Plan will be 28-30 per cent of the population, nearly the same figure as at the end of the Sixth Plan. This has important implications for the policies and performance of the present government. The debates in the past on poverty alleviation used to focus, among other factors and considerations, on the rather low trend rate of growth of around 3.5 per cent in the sixties and seventies. It used to be argued that with such a low rate of growth there could not be appreciable percolation of the benefits of growth down to the mass of the people to alleviate the condition of those below the poverty line. It was also argued that once the growth rate picked up to, say, about 5 per

cent or above, the benefits would begin to percolate down lifting up the masses below the poverty line. It is now claimed that the economy has been lifted to a higher growth path, with an average annual growth rate of 5.4 per cent in the Seventh Plan. And yet this higher growth has not alleviated the condition of those below the poverty line. Those below the poverty line are still 28-30 per cent of the population. The benefits of the supposedly higher growth in the Seventh Plan have thus apparently been wholly monopolised by the upper classes. This is a telling commentary on economic policy and management in the Seventh Plan which have been brazenly elitist in their orientation and so have kept the masses of the people out of the ambit of the growth process. The 6 per cent growth rate projected for the Eighth Plan cannot, therefore, give any comfort to the poverty-stricken masses and can bring cheer only to the exploitative upper classes and segments of middle classes which can pick up some crumbs. The poverty alleviation targets, more starkly than other quantitative objectives set in the Approach Paper, show graphically that the planning process has been subverted and turned into planning for the upper classes.

Postpone NDC Meeting

The prime minister, for his part, likes to order the planners to work backwards from a growth target set arbitrarily and to calculate on that basis the broad macro-economic parameters of the Eighth Plan. The first imperative of sound planning, however, is the delineation of a policy frame and political commitment on the basis of which to build a statistical model and arrive at plan targets which are feasible. Every one of the targets—the growth rate, saving rate, ICOR, employment generation and so on—set in the Approach Paper have policy implications which call into question the content and direction of official policies pursued in the eighties, more markedly since the mid-eighties. It has been claimed that policy issues have been outlined in the Approach Paper, but this has been done in such a manner that critical issues—such as elitist-oriented resource mobilisation, policies, including tax policies, the widening of the space available for big business and the opening of doors for multinationals with their labour-saving technologies, mechanisation of farming mocking at land reforms and inequitable sharing of gains of production and productivity both in industry and agriculture—have been sought to be obfuscated rather than pinpointed and highlighted. What has evidently weighed with the planners, is that the exercise of framing the Eighth Plan should be geared to subserve the political-populist and electoral objectives of the ruling junta which obviously seeks to retain full freedom to pursue its so-called liberalisation and high-tech modernisation policies even while mouthing populist slogans in a desperate effort to save its skin in the coming election. The writing of the Approach Paper, in spite of some tussle between the realists and the high-flyers, has been designed essentially for electioneering purposes. It cannot be regarded as a serious and meaningful step in the planning process.

It is yet a moot point whether the National Development Council will be convened before the elections to discuss the Approach Paper after it has been approved by the union cabinet. In any case, the NDC session is bound to be a stormy one. The move, if made, to convene the NDC will provoke responses from the opposition parties and state governments led by these parties which will be similar to their reactions in respect of the panchayati raj bill and the Jawahar Rozgar Yojna. The idea that the Approach Paper can become one more electioneering issue for the ruling party may sound smart but is not likely to yield dividends. It will indeed be wise to put off the session of NDC for the adoption of the Eighth Plan Approach Paper till after the Lok Sabha election in order to safeguard a modicum of political consensus on development planning itself. Pushing the Approach Paper through the NDC in order to clear the way for finalising the Eighth Plan, skipping the stage of drawing up of a draft outline of the plan, is also being proposed, but this can only queer the pitch for development planning. The opposition parties, for their part, must avoid getting bogged down with the targets which the Approach Paper seeks to flaunt and must raise sharp debates on the policy issues and the social orientation of planning under the Rajiv Gandhi government.

Rationing Medical Care in Kerala
Price and Non-Price Mechanisms

V Raman Kutty

Health services in Kerala are highly developed with at least one governmental health institution in every village. However, medical care is biased in favour of the elite due to at least three reasons—cost, travelling time and waiting time.

HEALTH economists often talk about the 'rationing of medical care' though there is some controversy regarding the use of this term. Some maintain that "no nation is wealthy enough to supply all the care that is technically feasible and desirable"[1] and hence rationing by the mechanism of price has always been present. What is meant is that if medical care is provided as a market good, only those who can afford the price can avail of the service, thus restricting the use of the product. Some others want to use the term only to denote deliberate rationing of certain services to certain segments, as is done in Britain's National Health Service, and they call market mechanism of allocation of services, 'price allocation'[2]. It has been pointed out that even in the United States, where the market forces are allowed free reign in most aspects of life, the egalitarian ethic in medical care has asserted itself through the provision of medical insurance, which attempts to pool the risks of people for major health expenses which they could not individually afford[1]. The general consensus, however, is that 'not all care expected to be beneficial is provided to all people'[3]. Given that resources allocated to production of health care are inadequate, it follows that there should be some mechanism which determines who shall have access to care.

This question becomes much more acute in most developing countries, though much less discussed, partly because the health services sector is mostly grossly inadequate to provide much needed care. Besides, health care competes with other priorities like sanitation, food production and immunisation, for scarce resources. Two important factors which distort the picture are (1) most third world governments are politically committed to providing free medical care. This means that health facilities be nominally free at the point of delivery, though many covert charges are associated with their use. (2) regional disparities in distribution of services are much larger in developing countries.

Thus, money prices may not be the important factor determining health facilities use in developing countries.

Travel time has been postulated to be an important component of cost of obtaining medical care in developing countries. When services are provided at little or no monetary cost, the opportunity cost of travel becomes important in deciding who shall have access to medical care. As is to be expected, the demand for medical care has been found to be more travel time elastic among the poor when compared to the rich[4]. This is possibly because the time taken off is forfeited from work, which poor people can ill afford to do.

One could postulate that there are three components to the price that people pay in developing countries to obtain medical care:

1 Money price
2 Travelling time
3 Waiting time

Table 1: Correlation Coefficients between Variables Relating to Distribution of Private Beds in Kerala, and Other Important Variables

	Kendall's Tau (non-parametric)
1 Pvt beds/1,00,000 population and	
(a) Per capita income	0.51
(b) Schools/1,00,000	0.79
2 Pvt beds/square kilometre and length of roads/square kilometre	0.74

Note : 'P' values are not given since all districts have been considered and there has been no sampling.

Sources: 1 Department of Economics and Statistics, Government of Kerala, Trivandrum (1986), *Statistics for Planning*, various tables.

2 Department of Economics and Statistics, Government of Kerala, Trivandrum (1987), *Report of the Survey of Private Medical Institutions in Kerala*, various tables.

Table 2: Districts in Kerala Ranked According to Number of Government Beds, Stratified According to Degree of Urbanisation

Most Urban	Less Urban	Least Urban
Trivandrum (1)	Quilon (8)	Pathanamthitta (11)
Kozhikode (3)	Alleppey (2)	Idukki (12)
Ernakulam (5)	Kottayam (6)	Wynad (13)
	Trichur (4)	
	Palghat (9)	
	Malappuram (10)	
	Cannanore (7)	

Note: Figures in brackets indicate the rank of the district in number of government beds. 'Most urban' contains the three districts with the 3 municipal corporations in the state, 'less urban' those districts with the largest 10 towns, and the rest of the districts fall into 'least urban'.

Source: As in Table 1.

In different situations, each of these becomes important. As one can imagine, the component of travelling time becomes a large factor for rural dwellers, especially when transportation facilities are scarce, and health care providers are concentrated in urban areas.

Price of Medical Care in Kerala

In Kerala health care services are well developed. There is at least one governmental health institution in every village. There are about 33,000 beds in the government and 50,000 beds in the private sector[5], which works out to 1 bed/309 people. People are knowledgeable about their rights to use these facilities. The government spending on health averages below 3 per cent of the state GDP[6]. If we assume that people spend about twice the government expenditure on health care, we already have a figure of around 9 per cent of the GDP spent on health.

In the private sector in health in the state, ability to pay clearly determines who shall have access to care. There is no health insurance, therefore all private health expenses are met out of personal resources. There is a high correlation between the per capita income in the districts, and the private bed density (Table 1). There is also a high correlation between private beds/square kilometre of area, and length of roads/square kilometre. This means that private facilities are situated in accessible places. So travel time does not figure largely in the price of private care. Thus private medical care in the state is allocated by money prices.

In the government sector, the picture is more complicated. Government beds are concentrated in the urban areas, as can be seen by comparing the rankings of districts with respect to urbanisation and number of government beds (Table 2). In a recent survey, the Kerala Sastra Sahitya Parishad, a voluntary organisation, found that 13-32 per cent of households in rural areas in the different districts of the state, gave 'distance' as a reason for not utilising the government health facilities[7]. Whatever free service is available in the government health sector is more accessible to urban dwellers. Thus, their travel time price of acquiring medical care is less than that of the rural people.

When money price and travel time become insignificant waiting time becomes an important component of the price of medical care. But waiting time price does not fall equitably on all the 'consumers' of medical care. There is a section of these for whom waiting time is practically reduced to nought. This may be because of privileged position in society, familiarity with the system, corruption, etc. The legitimisation of private practice of government doctors, as has been done in Kerala, encourages this 'jumping the queue' since it is difficult to deny priority to those who have previously consulted the doctor. Moreover, this also means that many people who may otherwise opt for private care, utilise government services because consultation fee is the only price they pay for all the care received. This 'price' does not truly reflect the cost of medical care consumed in many instances.

The effect of this 'jumping the queue' on the section which is not thus privileged, is that it increases its price of obtaining medical care in terms of increased waiting time. This means that this section, in total, consumes less medical care than they would have if the waiting time were more evenly distributed.

Conclusions

Thus, there are mainly three devices which preferentially allocate medical care in favour of a section of the population in Kerala:

1 Money price, which acts as the most important factor in the case of private care, and which favours the rich.

2 Travelling time—the government facilities being more easily available to the urban dwellers.

3 Waiting time, which introduces a bias in favour of more influential members of the community, in the allocation of health care. This bias, as we have seen, is perpetuated by the legitimisation of the private practice of government doctors. It should be remembered that these categories are not necessarily mutually exclusive. Thus, the rich are also more likely to be influential and urban dwellers. The net result is that the general health care system, government and private included, is greatly skewed in favour of the elite classes in allocating its benefits.

Rural Non-Agricultural Employment

Tara Shukla

The determinants of rural non-agricultural employment of rural-urban linkages, incidence of unemployment and poverty within the rural non-agricultural sphere and the characteristics of its labour market were among the central concerns of the National Seminar on Non-Agricultural Employment in India. A report.

A NATIONAL Seminar on Non-Agricultural Employment in India: Trends and Prospects, jointly sponsored by the Indian Society of Agricultural Economics and Gujarat Institute of Area Planning took place at Ahmedabad, between March 29 and 31, 1989. The seminar was unique in the sense that it brought together agricultural economists, urban economists, demographers, planners and policy-makers, making the dialogue inter-disciplinary. Any macro level study on employment in rural sector is necessarily confronted by two data sets, one provided by the decennial population censuses and the other quinquennial surveys conducted by the National Sample Survey Organisation. The former is plagued with frequent definitional changes, albeit with a view to improving quality of data, rendering comparison over time a little difficult. The other, though confined to the period 1973 to 1983, has an advantage of getting hooked up to the 1961 population census data on account of similarity in the concepts used. The latter source is decidedly more refined, conceptually uniform and touches upon various aspects not covered by the population census but disaggregated data are not available beyond the regional level as defined by it.

The thrust of the papers submitted at the seminar centred around determinants of rural non-agricultural employment, rural-urban linkages, incidence of unemployment and poverty found within this sector, the characteristics of its labour market, besides the trends in its growth and composition. The issues were examined both at the all India and at the regional levels, as also for different industry categories, based on the NIC classification at single, two or three digit levels, depending upon the requirement of indepth niceties of analyses.

Sectoral and Spatial Linkages

A careful documentative analysis of concepts used in different decennial population censuses and the biases that crept into the measurement of size and growth rates of employment overtime, was well borne out in the papers dwelling upon the subject. There was equally strong evidence from the regional level (Uttar Pradesh, Maharashtra, Tamil Nadu) studies that the pattern of growth of employment in different categories of the non-agricultural sector, as observed from population censuses and NSSO data was strikingly similar in most of the cases. It was perhaps because of this that, notwithstanding the different methodologies and sources of data used by different authors, broad results with respect to determinants of rural non-agricultural employment turned out to be similar or complementary to each other at all India as well as regional levels. Of the various explanatory variables used to gauge the types of linkages of rural non-agricultural employment with the agricultural sector, the variables relating to agricultural output per head uniformly proved to be weak as against agricultural output per hectare. Though variables like extent of mechanisation, ratio of area under non-food crops, gave varied results for the different regions studied, overall their individual explanatory power for impact on the level of non-agricultural employment was not found to be statistically significant. Indicators like agricultural productivity per hectare, index of agricultural development and area under irrigation emerged as strong proxies and showed significant positive correlation with the size of non-agricultural employment. Impetus from the agricultural sector for the growth of non-agricultural employment or rural industrialisation seems to be quite positive and strong. In other words, where the agricultural sector is growing, the non-agricultural sector is also growing. At the other end of the spectrum, however, the UP study observes that wherever the land-man ratio is adverse and technological change has been slower (for example east UP) there has occurred a marked absolute and relative growth of non-agricultural workforce.

Almost all the studies point to positive and strong linkages of non-agricultural sector with urbanisation. One of the regional studies (Maharashtra) pin-points linkages especially with the small and medium size cities, testing the correlations of aggregate growth in size of non-agricultural employment in aggregate with district per cent urban and for various NIC category groups, with industry specific city-size variables, namely, Class III, IV, V, VI, towns. The results obtained are positive and significant. The Tamil Nadu study, based on taluka level data, also observes some sort of threshold level where urbanisation emerges as an important factor. Grouping talukas on the basis of per cent urban (i e, less than 15 per cent, more than 15 per cent but less than 20 per cent and more than 20 per cent urban population) positive relationship is observed (significant at 5 per cent level) with non-agricultural employment, where the base year urbanisation is higher, while the relationship is negative in talukas where the base year urbanisation is low.

On the other hand, another study observes that the rural economy is perhaps responding to the force in the national market, the latter penetrating the former through the metropolises and other large cities (Class I), although in a limited way. The study assesses the process of sectoral diversification on the basis of select metropolitan regions which are defined by putting together the district around the metropolises of 1971, viz, cities that had population sizes over one million. It is observed from the study that the percentage of male workers engaged in household industries, in three out of seven metropolitan regions, has increased between 1961 and 1981 at the rate almost equal to that for India urban, it being substantially high for the rest of the regions. In the case of male employment in non-household industries, the percentage has gone down between 1961 and 1971 in Calcutta and Ahmedabad regions. The trend between 1971 and 1981 could not be discerned for want of data.

Another pertinent observation of this study is that the non-household manufacturing component of rural non-agricultural employment consists of the categories—accounting for 53 per cent of the non-household employment—that may not be using local raw materials nor basically catering to the regional market.

We, thus, have two types of scenarios wherein urbanisation provides an important linkage to the growth of rural non-agricultural employment. The linkage with small and medium size cities seems to be a natural phenomenon, arising out of growth mechanics, whereas that of metropolis and Class I cities is possibly the outcome of industrial dispersal policies with incentive packages as pursued especially from the seventies. The dispersal outward from the metropolises and Class I cities seems to be peripheral. The diseconomics of agglomeration, besides fiscal incentives would account for it. The percentage variations in employment in manufacturing and trade/commerce components of non-household industries in the selected regions are quite wide and there are many districts that fall below the average for the region without the metropolitan district. This dispersal therefore is basically different from the rural-urban linkages found in the case of small- and medium-size cities. This of course, may not be considered an altogether unwelcome development if it results in upgrading the rural skills and developing innovative and non-traditional entrepreneurship in the rural areas. But if this has not happened, there would be an apprehension that the thrust of dispersal of manufacturing and trading activities from

the Class I cities, as observed, may prove to be a backwash and possibly result in liquidating the endogenous rural industrial base having linkages with growth in agricultural sector. It may be incidentaly mentioned that the percentage of employment amongst cultivators and agricultural labourers has gone down in the case of four and three, respectively, of 7 regions studied. Such an occupational shift is possible and also justifiable if it lifts the overall levels of employment in the regions eventually and does not breed poverty. The policy strategy will need to come to grips with the issues involved in both the alternative routes to growth of rural non-agricultural employment. In this connection, the stagnancy or decline registered in rural based industries like (1) beverages, tobacco, and tobacco products, (2) jute, hemp and mesta textiles, and (3) leather, leather products, etc, should cause concern. The technology, location and organisation emerge as major constraints, as brought out by a national workshop on agro-processing strategy for acceleration and exports in 1988, held at Indian Institute of Management, Ahmedabad. An integrated strategy for development of this sector will need more indepth insights.

A study of Maharashtra observes that the rural infrastructure as it obtains presently, though not unfavourable to the growth of rural non-agricultural employment, is not conducive either, being somewhat agriculturally biased. The analysis of the contribution of various government plan and non-plan development expenditure to the growth in rural non-agricultural employment in Maharashtra suggests high a pay off from plan development expenditure on the power sector incentive package for industry, major irrigation projects and on roads and primary education from non-development expenditure. Similarly more can be expected from credit institutions which have so far played only a marginal role for this sector. With the growth of such conducive rural infrastructure and thrusts on development of small- and medium-size towns for agglomeration benefits, the integration of rural industrialisation with urban-based industries on one hand and agricultural sector on the other may prove to be mutually enriching.

Unemployment and Poverty Levels

Papers dealing with these subjects have used NSSO data set on person day unemployment. No comparable data are available from population censuses. The population censuses, however, give data on migration, rural to rural, rural to urban and out of state for males and females, an indicator which is relevant in discussing unemployment and poverty levels. These data are not available in NSSO data sets. Discussion on both these issues was one of the central themes of the papers. The pioneering work on 'Residual Sector Hypothesis' by Vaidyanathan provided an impetus for further exploratory probes on this aspect, with more segregated data and explanatory variables. Some per-

tinent observations stand out from the studies. In agriculturally developed regions, non-agricultural employment is high, wherever concentration in landholding/assets is high. Non-agricultural employment is low wherever proportion of area in the range of 5 to 20 hectares is high, the non-agricultural employment is high. Whenever non-agricultural employment rate is high, net-imigration of males is also high. So also is person day unemployment rate (PDUR). All these results are statistically significant. So we have a phenomenon where agricultural development, non-agricultural employment, rate of net imigration, rate of PDUR all move together.

The characteristics of the labour market in this sector are quite complex and yet segments/relationships are similar—self-employment, wage labour, casual labour; single worker; family workers' employer, employee. Occupational shifts, entries and exits would be more with development and integration and will need resilience and adjustments. The characteristics thus observed may be signs of buoyancy.

The concentration ratio based on land-holdings gives a much more kinked picture for the agricultural sector than that based on assets. The latter still has a negative correlation with the size of non-agricultural employment. A higher proportioin of area under cultivation in the range of 5 to 20 hectares gives a wider base for linkages with the non-agricultural sector through larger demand and supply situations and the correlation between the two becomes positive and significant. Male migration adds to the pool of labour and it is found to be veering to areas where both agricultural and non-agricultural employments are high. These migrants are mostly found in the 'employed' categories. Are they replacing the self-employed cultivators in the agricultural sector to fill the void created by the latter's occupational shift to the non-agricultural occupations as entrepreneurs and equity contributors?

Some apprehension has been shown with regard to availability of equity capital in the rural non-agricultural sector. Similar apprehensions were expressed with regard to the agricultural sector once upon a time but the studies in the sixties showed strong propensities to save and invest, amongst the cultivators, so as to enable capital formation to keep pace with increases in labour supply thereby keeping the capital-labour ratios constant. It will not be surprising to find a matching flow of capital from the rural sector if the rural industrialisation really takes off and experiences a technological breakthrough. This would, of course, demand an appropriate policy thrust.

The PDUR reported in the NSSO surveys may possibly prove to be either a temporary phenomenon, a 'waiting period' or a reflection of the aspiration of wage/casually employed to obtain better jobs. It may also be a structural phenomenon on account of skill-specific demand for labour and lag in adjustment on the supply side. The analysis of the labour market characteristics in the Maharashtra study has found labour in NIC 2 and 3 categories to be skilful and literate. Apart from these, a measurement issue seems to be involved in the analysis on unemployment rates as given in the papers. The estimates are based on current daily status rather than usual status. This would mean that they club together main and secondary workers. There can be differences of opinion on the concept thus used. However, one thing seems to be clear—a more discriminating questionnaire may be necessary for future rounds of NSSO on this aspect, so that finer analysis is possible.

Some attempts have been made to estimate incidence of poverty in the rural non-agricultural sector. Analysing poverty incidence on the basis of average wage earning of casual labourers in non-agricultural operations, one study observes a positive association of average non-agricultural wage earnings of males with percentage of male non-agricultural workers. Non-agricultural wages are found to be higher than those obtaining in the agricultural sector. When this observation is linked with the observation of the same study that unemployment rates are higher in agriculturally developed regions which also have higher a percentage of non-agricultural workers, it would mean that high unemployment rates do not depress the non-agricultural wages relative to agricultural wages. This leads the author to conclude that higher unemployment rates are not indicative of higher incidence of poverty in this sector. Another study finds incidence of poverty to be higher for the self-employed but lower for the regular wage employed and casual labourers in the non-agricultural sector compared to their counterparts in agricultural sector. These studies, however, club together main workers and secondary workers in their estimation a practice whose conceptual appropriatness is questionable. Doubts may also be expressed about the comparability of the categories of self-employed and wage employees in rural non-agricultural and agricultural sectors. Will there not be some sort of skill specificity, especially in the case of the rural non-agricultural sector, even in such occupations as construction, which is known to be preferred by a certain section of the rural community and may not be considered as one where entries and exits may be open at both the ends. There may be an element of stickiness of wages even in this apparently non-unionised sector on account of inelasticities especially on the supply side. This may have a bearing on the co-existence of high unemployment rates and high wages, like in urban formal markets though for entirely different reasons. The rural non-agricultural labour market seems to be very complex and very segmented, unlike the agricultural labour market, and there may exist common as well as complementary labour pools from which both the sectors in rural areas draw their supply of labour resources. The residual sector hypothesis may operate in some segments whereas other segments may be more subject to forces of demand and supply situations.

In this context, there should be equal concern with the extent of exogenous labour force in the rural non-agricultural sector. Most of it may be on account of public sector occupations, including financial agencies, community organisations, like public health workers, etc. The increasing dispersal of industries around and on the periphery of metropolises and Class I cities has been observed earlier. These industries, by definition are capital intensive, and being skill-specific probably also 'import' labour into rural area, without *pari passu*, creating much fall out effects on endogenous employment. Among other things, this may carry the urban consumption patterns to rural areas with a built-in component of demonstration effects. Of course, this by itself may not be considered an unfavourable feature. The 'imported' labour would simultaneously generate demand for rural products and services but this phenomenon cannot be converted into a good booster for upgradation of rural skills and production processes unless steps are taken to set up requisite infrastructure, institutions and organisations for capitalisation, to the benefit of rural industries.

The issues relating to capital requirements of rural non-agricultural industries are not much perceived nor are the capital/output, capital/labour, input/output ratios. These issues are besieged with conceptual, measurement, and data problems. It is time that the strategy for growth of rural non-agricultural sector is seen as an independent entity rather than as an appendage to the urban or agricultural sector or as a consequence of urban sector and agricultural sector development.

The Seminar on Non-Agricultural Employment in India: Trends and Prospects has initiated debate and brought together researchers from different disciplines having different focuses but bearing on the subject.

J.K. Synthetics Ltd.

NOTICE

It is hereby notified for the information of the public that **J.K. Synthetics Ltd.** proposes to make an application to the Central Government in the Department of Company Affairs, New Delhi, under Sub-section (2) of section 22 of the Monopolies and Restrictive Trade Practices Act, 1969, for approval to the establishment of a new undertaking. Brief particulars of the proposal are as under:-

1. Name and address of the Applicant : **J.K. Synthetics Ltd.,** Kamla Tower, Kanpur

2. Capital Structure of the applicant organisation

Share Capital	Authorised (Rs./lakh)	Issued, Subscribed & Paid-up (Rs./lakh)
Equity Shares of Rs. 10/- each	8500.00	3843.36
Cum. Red. Pref. Shares:		
–11% of Rs. 100/- each	100.00	100.00
–14% of Rs. 100/- each	1200.00	300.00
–15% of Rs. 100/- each	200.00	100.00
	10000.00	4343.36

3. Management structure of the applicant organisation indicating the names of the Directors, including the Managing/Wholetime Directors and Manager, if any : A Public Limited Company managed by two Managing Directors and two Wholetime Directors under the superintendence and control of the Board of Directors. The details are as under (As on 31-3-1989):-
   1. Dr. Gaur Hari Singhania (Chairman & Managing Director)
   2. Shri Govind Hari Singhania (Vice Chairman & Managing Director)
   3. Shri Yadupati (Wholetime Director)
   4. Shri Ramapati (Wholetime Director)
   5. Shri Chiranjilal Jhunjhunwala
   6. Sir Bhim Singh
   7. Shri Narendrajit Singh
   8. Shri Bharat Hari
   9. Shri S.S. Betrabet (Nominee of ICICI)
   10. Shri K.C. Mittal (Nominee of G.I.C.)
   11. Shri K.B. Agarwal
   12. Shri Shailendra Swarup

4. Indicate whether the proposal relates to the establishment of new undertaking : The proposal relates to implementing the expansion capacity of 11,730 tpa of Polyester Filament Yarn through a new undertaking under the name of India Synthetics Limited, and by way of change of location from the non-backward Dist. of Kota in Rajasthan

5. Location of the New Undertaking : Banswara, 'C' Category backward District in the same State of Rajasthan

6. Capital Structure of the proposed undertaking : Authorised Capital Rs. 2.00 crores (initially)

7. In case the proposal relates to the production, sotrage, supply, distribution, marketing or control of any goods/articles, indicate:
   - i) Name of goods/articles : Polyester Filament Yarn
   - ii) Proposed licensed capacity : 11,730 tpa covered by Letter of Intent No. LI.61 (86) dated 7-2-1986.
   - iii) Estimated annual turnover : Rs. 99.00 crores (net sale value of production) at full production.

8. In case the proposal relates to the provision of any service, state the volume of activity in terms of usual measures such as value, income, turnover, etc. : Not applicable

9. Cost of the project : Rs. 94.00 crores

10. Scheme of Finance, indicating the amounts to be raised from each source :

	Rs. lakhs
i) Equity/Cumulative Preference Shares—JKS, its Associates, including NRIs, Foreign Institutional Investors, Collaborators	1880
ii) Foreign Currency Loans/external commercial borrowings/suppliers' credit (Export credit)	2170
iii) Fully or partially convertible debentures/loans from financial institutions and banks, deposits, suppliers' credit	5350
	9400

Any person interested in the matter may make a representation in quadruplicate to the Secretary, Department of Company Affairs, Government of India, Shastri Bhavan, New Delhi, within 14 days from the date of publication of this notice, intimating his views on the proposal and indicating the nature of his interest therein.

DATED: This 28th day of Aug., 1989

Lessons of Tiananmen Square

S Vidyarthi

The recent events in China point to the urgent need for smashing the capitalist system there, and the need for a genuine Marxist-Leninist Party in the interest of genuine communism. History will prove that only communism can save China.

IT was not at all surprising that the western media and the governments of the major capitalist countries waxed lyrical over the recent developments in China. For long they had been proclaiming the demise of communism, and now the events leading up to June 4th gave them much succour. A tragic situation for the Chinese people became a cause for cheers and celebration as far as these gentry were concerned.

Now that the smoke has cleared and it is becoming apparent that the faction of Zhao Ziyang has been crushed, at least momentarily, one is witnessing the spectacle of contorted exercises in damage control on the part of these various powers. Deng Xiaoping is alleged to have said that China represented 'a tasty morsel of meat' for the foreign powers, and as Deng reasserts his command what these powers fear most is the loss of their economic influence in China. They recoil from thoughts of the possible geopolitical realignments that may come about. It is increasingly being felt in the corridors of the White House, Westminster and the Quai d'Orsay that the wrong horse was backed. Hurriedly, they are trying to scramble over the obstacles created by their own florid rhetoric and make their peace with Deng. The pragmatism of merchants has taken over from the lusty cheers of ignorant louts.

Disastrous though the events of the past month have been for the Chinese people, their continuing calvary under the reactionary regime of Deng Xiaoping is being relentlessly presented as the 'evil fruits of communism'. In this regard, although there is much talk of the brazen mendacity of the Chinese government in denying that its troops ever opened fire in Tiananmen Square, there is scarcely a mention of the biggest mockery of truth, the biggest fraud—and that which both the Chinese government and the western press ceaselessly proclaim—which is the assertion that the Chinese state is a communist state. Once this basic lie is accepted, then only confusion can prevail. It will not be possible to explain the travails of the 'democracy movement', nor its protagonists or slogans. Its fundamental character can and will be twisted at will to suit the particular agendas of various interested parties, and the genuine path for the emancipation of the Chinese people will be cluttered up by a hundred-and-one useless theories.

Reality of Chinese Economy

Long before the recent tumult began, the development of the Chinese economy itself had provided ample proof of its essentially capitalist physiognomy. While the form or outward appearance this capitalism takes is different from the form of classical capitalism, with the majority of industry in the hands of the state, and land not privately owned but 'leased for a generation', it is clear that the entire production in China—whether in town or country—relies on the making of profit as the sole motive of production, and the appropriation of this profit by the rich, either directly, through enlarged leaseholding rights in land, or through the bloated salaries and perquisites of the managerial strata, the party functionaries and so on. If we add to this the fact that there has arisen in China a distinct and numerically significant *private* capitalist class—who themselves directly own the means of production—and treat labour as a commodity in the most blatant fashion, as well as the presence of joint ventures with foreign capitalist firms, it becomes clear that the Chinese economy can under no circumstances be described as 'socialist' or 'communist'. Stock markets have been set up in Shanghai, Beijing and Shenyang, as well as in several other cities, with some types of share issue paying dividends based on profits, and not just fixed interest. By now it is estimated that approximately 10,000 companies in China have issued shares, and some companies in the eastern city of Shenzhen even issue shares to foreigners. The Chinese government is also clearly moving in the direction of privatising existing state-owned industries, hoping that a change in the *form* of ownership of capitalist property will somehow rescue the economy from its many problems. The organ of the Communist Party of China, *Renmin Ribao*, gives prominent coverage to the views of right-wing economists like Li Yining, Hua Sheng and others who advocate mass lay-offs, price increases and the creation of a western-style shareholding capitalist system. Hua Sheng was quoted as saying that although Marx 'was generally correct in the field of politics', he 'erred in economics by opposing private property'! Indeed Marx—were he alive today—would have had no compunction in labelling China a capitalist country.

Predictably, the course of the reforms has caused severe dislocation in the economy and hardships for the people. It has led to a great polarisation in the distribution of income in both the urban as well as rural areas, and large kulaks have reappeared for the first time since the revolution of 1949 had expropriated the large landowners. Rampant inflation, estimated at between 30 and 40 per cent per annum, and the increasing fear of unemployment coupled with the rapidly multiplying perception that a tiny minority is enriching itself at the expense of the majority, have led to a situation where there is serious disaffection amongst vast sections of the people towards the direction in which China is travelling. Already, more than fragmentary evidence of popular resistance is available. It has been reported that in Inner Mongolia, for example, the government has established special teams of bodyguards to protect entrepreneurs from the ire of the people. A businessman in the eastern city of Jiangyin had his factory smashed by frustrated workers and he was even sued to demand that he share his profits with the people. In Shenyang, a worker killed his factory owner, and was himself promptly executed. The residents of Shenyang, however, regard the youth as a folk hero because the boss was considered a tyrant who got his come-uppance.

Counter-Revolution within Counter-Revolution

Such acts are merely the most severe expressions of the great aggravation of class tensions and conflicts China has witnessed in recent years. These have pitted the workers and peasants against the capitalists and their 'communist' party as well as the various sections of the emerging Chinese elites against each other. While a precise discussion of the composition of the different sections of the bourgeoisie is difficult to embark upon, it may be observed that, for example, the capitalists in Shenzhen (right on the border with Hong Kong) who are bent on increasing the penetration of foreign capital and who see that penetration as a prime source of personal enrichment have a definite basis for contradictions with the emerging kulaks or with the capitalists from outside the special enclaves, with bureaucratic capital and so on. Those sections of the bourgeoisie linked with say the US could also have a tendency to come into conflict with those nurtured by Japan, or others. Within classical capitalist countries, these conflicts rarely take on an acute or violent form partly because of the role the 'pluralist', multi-party system of bourgeois democracy plays in mediating and modulating these conflicts. The recent bitter factional struggle in the Chinese party is evidence that under a different juridical framework, one would have actually seen the emergence of different political parties, but the contradictions among the Chinese ruling classes have not, at the present juncture, reached such a sustained level. The reforms are strengthening the process of class formation, but this process has yet to be played out fully. In Poland something akin to Western style 'parliamentary democracy' has already emerged, and perhaps China is on that path.

The Chinese leadership has shown itself willing and able to exploit the contradictions between the two superpowers, as well as between the US, Europe and Japan to achieve its goal of becoming a major player in the geostrategic struggle for markets and global spheres of influence. From the early seventies, this has been the direct thrust of their foreign policy, with the Mao Zedong regime issuing fulsome praise for and allying itself with the EEC and the US, and developing the pragmatic "Theory of the Three Worlds" for the ideological legitimisation of its counter-revolutionary moves. Today there can be no doubt that the Chinese government is a counter-revolutionary government. The dominant sections of the Chinese bourgeoisie have definite plans to turn China into an imperialist superpower, and are willing to accept foreign credits and investments only insofar as they assist them in that goal. But they are wary of turning China into a vassal of any other power, and any capitalist or ultra-reactionary elements who desire relations of close proximity with other imperialists are bound to be viewed with distaste by the dominant sections. This is one of the reasons for the continuous infighting and jockeying for power within the Communist Party of China. The important point to stress is that, even today, there is not much disagreement with regard to fundamentals: anti-communism and fear of revolution are as much a part of the outlook of Li Peng and Deng as they are for the Zhao Ziyang group. Disagreements arose and will continue to arise over the *precise shape and contours of the path of counter-revolution*, and in this, the speed of change and the degree of alliance with other imperialist powers are very definite factors. The path of reforms also throws up some sections who gain and some who lose from *within* the ranks of the bourgeoisie, and this becomes another explicit bone of contention. At times, such disputes and conflicts can flare up, and recognised norms of resolution within the apparatus of the party no longer suffice. Armed clashes can break out. Police measures may be used. Such is the basis for the *counter-revolution within the counter-revolution*.

Meaning of 'Democracy' Movement

The faction of the Communist Party of China led by Zhao Ziyang utilised the death of another kindred spirit and strong champion of the current 'reforms'—indeed a proponent of their extension and further deepening—Hu Yaobang, to test the waters of counter-revolution. It was reported that thousands of 'students' joined him in organising Hu's funeral in a demonstrative fashion, openly issuing calls for greater 'liberalisation', a euphemism for what is essentially bourgeois democracy and a speed-up of the market-oriented reforms. The western media roared with approval, and after a short period of stock taking, the larger movement began, this time the main slogans being "greater democracy" and "anti-corruption", and with the same student leaders of Beijing University in the leadership. At one point it was estimated that close to half a million people took to the streets in Beijing, and there can be no doubt that this was a reflection of the tremendous hardship and exploitation the Chinese people had endured, particularly in recent years. They took to the streets to vent their anger and frustration against the regime and no doubt lent to the demonstrations a more popular character than had previously been displayed. For a moment it looked like the genuine grievances of working people might be articulated—their hatred of the capitalist system, its inflation, unemployment and income inequalities, their hatred of the foreign capitalists who had reappeared on Chinese soil, etc—but as events rapidly unfolded, this proved to be a pipe-dream. The 'student' leaders lodged in Tiananmen Square made several appeals that they wished to confine the 'democracy' movement to students only, or rather only to those who shared their narrow agenda and, either for this or for other subjective reasons, the large crowds that had taken to the streets in the beginning rapidly thinned out. The students demanded 'democracy', and yet were silent about the capitalist system in China whose very existence is the negation of democracy. The hidden agenda of these student leaders was, of course, that which they had prematurely raised during Hu Yaobang's funeral—for more capitalist reforms and foreign capital—but which if directly raised, would never have struck a chord of sympathy with the people. Hence the counter-revolutionary agenda was deliberately cloaked in imprecision and nebulousness, with some student leaders going so far as to say that what they wanted was 'democracy', although they weren't sure what exactly it was!

Of course in such movements, the battle lines are rarely drawn with such accuracy that one can characterise all those who demonstrated during those fateful days as counter-revolutionary. It is not unlikely that progressive individuals and forces—especially from the working class—might have been associated with the movement, at least in its earliest stages, but they were clearly unable to impart a progressive agenda to its overall character, save for some desultory references to the evils of inflation. It was also reported in the western media that some of the protestors were singing the *Internationale*, the Communist anthem, but one cannot conclude much from that fact alone. The Chinese leadership too takes pride in singing it, and this is not surprising since it is a symbolic source of legitimacy in a country where the people have strong and ancient sentiments for communism. In any event, it was surprising that the demonstrators, albeit professing *naivete* when asked what kind of democracy they envisaged, should have chosen as a symbol for their 'democracy' replicas of the 'Statue of Liberty', a symbol which the entire course of world history has shown to be reactionary. In the eyes of the world's peoples, the Statue of Liberty epitomises US imperialism, the biggest enemy of democracy on earth, and it is hard to believe that the 'students' were unaware of this. Many of the 'students' also held aloft banners and placards praising perestroika and glasnost, which have also become the watchwords of world reaction. Instead of such symbols and slogans being removed and their promoters ruthlessly driven out of the movement, the 'students' loudly proclaimed their affiliations and class partisanship by choosing an incarnation of the Statue of Liberty—the so-called 'Goddess of Freedom and Democracy'—as the final symbol of their movement. That is how history will remember them. Fitting indeed, for now the overall character of their movement can never be in doubt.

A lot has been said and written about the provocative and distorted manner in which the capitalist media reported the events in China. In their coverage, they chose to accomplish several tasks simultaneously. Firstly, it was to *besmirch the banner of communism* by constant allusion to the Chinese government as 'communist', even though all the facts showed its capitalist and indeed, fascist nature. Secondly, it was to *raise the prestige of capitalism* by presenting the open protagonists of capitalism in China as

heroes, and by down-playing and ignoring the terrible economic problems facing the people as a consequence of the capitalist system that exists in that country. Thirdly—and this is in reference to the broadcasts of the US government's 'Voice of America' radio station about how fighting between different units of the Chinese army had 'already begun' (although there was no evidence for this)—they aimed to *provoke a civil war situation in China* with the ultimate aim of installing a government more amenable to foreign imperialists, and in particular, to American interests.

The Chinese government, by taking military steps, proved that it was more than capable of meeting the threats and violence of the 'students' and brought this counter-revolution within the counter-revolution to an end. The cutthroats of the ruling faction will now exact a bloody revenge on the cutthroats who dared oppose them, and this factional struggle will also bring more tragedies for the Chinese people, as many innocent people and genuinely progressive elements will also undoubtedly be identified and annihilated. The capitalist economy of China will remain untouched and the process of 'reform' is bound to deepen, causing great problems for the Chinese working people.

The stage has thus been set for the Chinese working class and peasantry to make their appearance, united, and with a genuinely revolutionary party of their own. The recent events in China, far from confirming the demise of communism, are merely an urgent confirmation of the necessity of ending the rule of the anti-people factions of the Communist Party of China, of the necessity of smashing the capitalist system existing in that country, of the necessity of building a genuine Marxist-Leninist Party, of the necessity for genuine communism. History will prove that only communism can save China.

MALAYSIA

Towards a Two-Party System?

M G G Pillai

At last Malaysia faces the possibility of a two-party system, but whether this would be accepted by the dominant Malays remains to be seen.

THE Malaysian prime minister, Seri Mahathir Mohamed, in control of the federal and state governments as ever, continues to look over his shoulders as he attempts to wean those in the Malay community that reject his leadership. The near unanimity with which he was accepted as prime minister in 1981 has all but disappeared. The six by-elections since the split within the United Malays National Organisation (UMNO), which dominates the ruling National Front coalition, showed that support is still wanting. His party won the by-election in the state assembly constituency of Tambatan, in Johore state, on August 5, but not as decisively as it thought it would.

The National Front has won elections, almost always, with non-Malay support; some credit Tengku Razaleigh's group with taking more than 50 per cent of the Malay votes so far. This is what makes UMNO Baru's position more precarious than it is thought to be. Without Malay support, Mahathir remains a lame duck, even with his huge majorities in parliament and the states. But his problem is that his own UMNO Baru is divided hopelessly, with factions reserving their venom for their opponents in the party rather than for Tengku Razaleigh and his supporters.

Now, Tengku Razaleigh has formed a political party, Semangat '46 (Spirit of '46), and a coalition of opposition political parties. Called the Angkatan Perpaduan Ummah (People's Unity Front), the coalition would forge links with opposition political parties like the Democratic Action Party (DAP) and displace the National Front as the government. The problems within UMNO Baru overshadowed the by-election in Tambatan. Johore remains divided on its support for UMNO Baru; the refusal of UMNO Baru in Johore to admit as members several men and women, including Shahrir Samad, the former cabinet minister, has not helped. The decision was reversed by the UMNO supreme council in the midst of the campaigning, but it did not have the impact it thought it would.

The differences between the UMNO Baru secretary-general, Mohamed Rahmat, and the chief minister of Johore, Tan Sri Muhyuiddin Yasin, did not help. Muhyuiddin Yasin had to be ordered by federal UMNO Baru to take charge of the by-elections, but he proved himself to be a much more capable politician and campaign director than his opponents gave him credit for. It would be more difficult now for Mohamed Rahmat to displace him as chief minister, much as he wants to.

What the six by-elections have shown so far is that both UMNO Baru and Semangat '46 have become more confident about their respective positions. In the early by-elections, the challenger always had the advantage, but that has been narrowed by UMNO Baru's bigger resources and its intuitive selecting of capable people to run its campaigns. The one common thread in all the by-elections has been that the winner always had a better organisation. If anything, UMNO Baru has pushed Semangat '46 and its allies on the defensive.

UMNO Baru campaigned in each by-election on local issues and gave them a national perspective, while Semangat '46 did the opposite. In Tambatan, Semangat '46 was hampered by the aggressive campaigning by PAS workers, most of whom came from out of the state, and by the DAP. What has happened is that the series of by-elections, instead of damaging UMNO Baru as many had thought they would, have strengthened its organisation. Semangat '46, on the other hand, finds the internal problems surfacing embarrassingly in the face of a determined challenge from UMNO Baru.

Tambatan had its local difficulties for UMNO Baru. The member of Parliament for Pulai, Mohamed Rahmat, is not only disliked but is also determined to reduce what support both the former deputy prime minister, Musa Hitam, and Shahrir Samad have in the party. But without them the Johore UMNO Baru would continue to be split. It is widely believed that it is Rahmat who campaigned hard to prevent Musa's and Shahrir's supporters from being admitted into UMNO. On top of that, Rahmat has been wanting to end his political career by being chief minister. But Muhyuiddin Yasin is not about to give up easily.

Much money, more than is legally allowed, was spent by both UMNO and Semangat '46. Of the four candidates, the two independents were at best spoilers. UMNO Baru won because of its better organisation and because the opposition had too many outsiders campaigning on its behalf. But again it was the non-Malay voters who ensured the party's victory. It is this absence of a clear support from the Malay community that is UMNO Baru's Achilles heel.

That is the contradiction. You cannot hope to have legitimacy without majority support among the Malay community, but you cannot hope to form a government without non-Malay support. UMNO clearly has the latter, but of the former it is uncertain; Semangat '46 has about the same support among the Malays as UMNO has, but of non-Malay support it is uncertain. Which is why the battle is evenly matched, although by being in power, UMNO Baru has a clear edge.

Ultimately victory depends on how effectively each group can get all the three races to the polling booths. But who has the mandate to govern would have to wait the general elections; perhaps it would not be clear even then. Which is why Semangat '46 is building a coalition of opposition Malay and non-Malay parties. At last Malaysia faces the possibility of a two-party system; but whether it would be accepted by the Malays, who wield political power, remains to be seen.

ZUARI AGRO CHEMICALS LIMITED

JAI KISAAN

STATEMENT OF THE CHAIRMAN SHRI K.K. BIRLA DELIVERED AT THE 21ST ANNUAL GENERAL MEETING OF THE COMPANY ON 30TH AUGUST 1989

Shri K.K. Birla

I have great pleasure in welcoming you to the 21st Annual General Meeting of our Company. You have already received the annual report with the audited accounts and the Directors' Report for the 15-month period ending March 31, 1989. I seek your permission to take them as read.

The Economy

The year 1988-89 was a significant period for our economy as it was marked by remarkable growth both in agricultural and industrial sectors. With this growth trend, the economy is poised for further substantial gains. Viewed in the background of successive droughts, the performance of the economy speaks for its inherent strength and resilience.

We owe this performance mainly to the improved utilisation of capacities built up over four decades of planned development, higher efficiency and judicious management of the food economy. Of course we must hail our farmers for their hard work and pragmatism to adopt the new scientific methods in their agricultural practices. The economic policies initiated by our Prime Minister, Shri Rajiv Gandhi, based on growth, liberalisation, self-reliance and social justice have provided a new impetus to growth.

In the agricultural sector, the year 1988-89 witnessed a smart recovery from the depressing spell cast by frequent droughts. During the year, the output of foodgrains rose by about 23% from 138 million tonnes to over 170 million tonnes. The excellent performance of agriculture in the fourth year of the Seventh Plan augurs well for the years to come, particularly in view of indications of another good monsoon in 1989.

Whilst on the subject of agriculture, special mention needs to be made of the successful work carried out by the Technology Mission on Oilseeds appointed by the Government of India in May 1986. This Mission has brought to the fore the best of production, processing and management technologies available to accelerate self reliance. It is now expected that the objective to produce 16 to 18 million tonnes of oilseeds in 1989-90 will be met thereby cutting imports by half.

The industrial sector has also acquitted itself creditably. As per Government of India's provisional estimates for 1988-89 the industrial sector achieved a growth rate of around nine per cent. Most industries recorded significant increases in production. The manufacturing sector, which accounts for four-fifths of our industrial production, has done particularly well.

However, in spite of excellent economic fundamentals, the economy continues to face major challenges on the balance of payment front. The surge in imports partly necessitated by the previous year's drought together with the rise in the international commodity prices has aggravated an already difficult situation. In this context, one of the bright spots is the reduction in fertiliser imports from around Rs. 1400 crores in 1985-86 to less than Rs. 500 crores in 1987-88. Credit to a large extent goes to the indigenous fertiliser industry which, by increasing production, has helped mitigate the balance of payments problem.

Fertiliser Scene

After four years of low growth in consumption on account of droughts, 1988-89 witnessed a jump in consumption by over 23% to 111 million tonnes of nutrients. Fertiliser is a key input in the growth of our agriculture. In view of the need to provide food for a growing population, it would be necessary to increase fertiliser production capacity both by building new plants and by removing the bottlenecks in the case of existing ones. You are aware that some of the plants which were to be completed during the Seventh Plan period will now have to be phased for completion in the Eighth Plan. Although we may not feel the crunch immediately, it is estimated that by the mid-nineties, with a higher rate of consumption coupled with an inadequate production capability, the country would again face a substantial import gap as far as fertilisers are concerned. I am aware that the government and the industry are genuinely concerned about this problem and will take timely action to forestall the situation.

Financial Results

I am glad to say that during the 15-month period under review, our good track record has shown further improvement. The financial results of

the company during the period show a gross profit of Rs. 2619.23 lakhs as against Rs. 1601.97 lakhs for the 12-month period in 1987. The profit before tax was Rs. 2121.15 lakhs as compared to Rs. 854.09 lakhs in the previous year. Similarly, the net profit was higher at Rs. 1206.15 lakhs as against Rs. 434.90 lakhs last year. This excellent financial performance is indicative of the strength and vitality of our company.

Our plant is the heart of our operations, and I am happy to say that it continues, to live up to its reputation as one of the most efficient plants in the country. In fact we won for the second successive year the Fertiliser Association of India's award for the best production performance in nitrogenous fertilisers. We continued to maintain our record of high capacity utilisation of all the plants. During the period under review, we manufactured 454355 MT of urea, 232509 MT of DAP and 215896 MT of NPK respectively. The principal constraint in the case of NPK and DAP was disruption in supplies of phosphoric acid, resulting in the shutdown of our phosphatic plants from February-March 1989 for reasons beyond our control. We have made representations to the Government of India for reimbursement of standing charges during periods of plant shutdown due to unavailability of phosphoric acid. Considering the circumstances leading to this industry wide shutdown, we are confident that this issue which from industry standpoint is very curcial, will be favourably considered by the Government.

Coming to our performance in sales, I am happy to say that thanks to a good monsoon and greater sales efforts, our turnover in 1988-89 was higher at 918227 tonnes as compared with 639286 tonnes in the previous twelve months. We are grateful to the Government for taking prompt measures to combat the glut conditions which plagued the industry in the previous two years by withholding urea imports and by resorting to a judicious use of ECA allocation. These measures have had, undoubtedly, a salutary effect in stabilising the market.

New Projects

From this forum I have talked about our new projects from time to time. The giant gas-based fertiliser plant, which we had promoted for setting up near Sawai Madhopur has now been assigned a new location, near Gadepan in district Kota. The name of the company promoted by Zuari to implement the project has been changed from Aravali Fertilisers Ltd. to Chambal Fertilisers & Chemicals Limited in view of the change in site. You are aware that the earlier site had to be changed because of revised guidelines prescribed by the Ministry of Environment and Forests.

You will be glad to know that the work on Chambal gas-based plant has commenced. We have already taken possession of land admeasuring 644 acres at Gadepan and the tempo of work will now gain considerable momentum.

I must mention here that doubts have been raised in some quarters regarding the viability of new gas-based projects in the light of the changes in the retention price norms. After careful thought, we feel that the basic economic justification of the Chambal project having been well recognised, the representation made to Government of India to review favourably the new parameters of the fertiliser retention price formula is bound to be heeded, as fertiliser is so vital for the progress of our agriculture.

Food processing is a fast growing industry in the country. Its importance is demonstrated by the fact that the government has set up a new ministry to promote this industry. To participate in this growth sector, we had put up a proposal to set up a hundred per cent export-oriented food processing project in Himachal Pradesh. This proposal has now been cleared by the Government.

The company's search for new opportunities for diversification continues. We have the resources and the skills to undertake such new projects. Presently, the company is actively pursuing various new projects including manufacture of cement, telecommunication equipment, and optical fibre cables.

Environment

It is a matter of pride that we have continued to maintain high standards of environmental protection. Our effort is not just to control pollution in accordance with rules, but we have also a commitment to protect and improve the living landscape around us. You will be glad to know that the Zuari plant was shortlisted by the Fertiliser Association of India Awards Committee for the 1987 Best Environmental Protection Award.

Our plant is also reputed for its excellent safety performance. Over the years, owing to stringent practices followed in the plant and the full cooperation of the employees and their participation in the effort to keep our operations safe all the time we have maintained an excellent safety record.

You are aware that your company has a comprehensive programme for rural action and community development. We continue to play a larger role than just manufacturing and selling of fertilisers. We are closely associated with national programmes such as dryland farming and intensive district development. We continue to bring to the farmers the latest in agronomic technology by conducting training programmes for farmers, visits of farmers to agricultural research centres and extended block demonstrations. Our award of scholarships to deserving students, and aid to cultural and educational institutions, are other examples of our commitment to community welfare.

Our industrial relations have continued to be cordial. This is largely due to the dedication and unstinted support of our employees and others. On your behalf and on may own behalf, I take this opportunity to express our appreciation for their cooperation. I am sure that they will continue to maintain the high standards for which our company is known.

I would also like to take this opportunity to express our gratitude to the Goverment of India and the Government of Goa for their unfailing guidance and support. I also thank our collaborators M/s USX Corporation of Pittsburgh, USA for their continuing cooperation.

Thank you.

This does not purport to be a record of the proceedings of the Annual General Meeting.

Mobilising Scheduled Castes and Scheduled Tribes

Sharad Patil

The victory of the total Indian revolution that will abolish caste, sexual and class inequalities inextricably linked to the revolutionary mobilisation of the SC and ST masses.

AS is well known the scheduled castes constitute 15 per cent of the Indian population and the scheduled tribes 7.5 per cent, and together they make up 22.5 per cent of the Indian people. But the implications of this post-independence fact are usually missed by sociologists and political activists of the opposition. The ruling party, the Congress(I), is instinctively conscious of not only the fact, but of the pluralist advantage flowing from it. The greatest failure of the left lies in not realising this advantage of the ruling party.

In the pre-independence period Muslims were the biggest minority in India which is why the British assigned the most important place to this minority as part of their strategy of counteracting the freedom movement. In post-independence India the SCs and STs have become the biggest minority and hence they have assumed the most pivotal place in the strategy of the ruling Congress Party in counteracting the left movement.

But here the similarity ends and dissimilarity begins. Muslims are a religious minority and not second class citizens in this country. Like every non-Hindu Indian religion, Islam has also been affected by the caste system. But not being an inseparable part of the system, the Muslims are not one of the basic forces interested in abolishing it. Hence they are not a motive force of the Indian democratic revolution, though they are an important ally of the democratic forces.

As against this the SCs and STs both are broadly inseparable parts of the caste system —its mainstay and foundation. Why broadly? Because except for the proletarianised STs incorporated in Sahu[1] *(Diku)* areas, the scheduled tribes still living in contiguous scheduled areas as peasant proprietors are not integrated into the caste system but are on its fringe. Nevertheless, these tribes are also treated as Ati-Sudras by the Sahus as is evident from the relations between them in states like Tripura. As for the proletarianised STs incorporated in Sahu areas, the Dharmasastra includes them in the Ati-Sudra category, but does not consider them as untouchables.[2] These two stages denote the process of how backward tribes were incorporated into the caste system as communities. There are numerous examples of how such communities later sank to untouchability. A classic example is of the Mahar untouchable caste. Excavations at Sanjan reveal that the tribes of Kolis and Mahars formed a tribal confederation (*sangha-gana*) which ruled the country thereabouts (*janapada*) at least up to AD 500.[3] The once sovereign tribe of Mahars later, i e, after the break up of the *sangha-gana*, sank to untouchability, though the Koli caste has remained *niravasita* or non-untouchable Sudras according to the Paninian, grammatical rule II 4.10.[4] It should be noted that the STs still consider the Mahars to be untouchables!

It is thus that the SCs and STs form the base of the caste pyramid which is devoid of any staircase as aptly described by Ambedkar.

What this means in the present social revolutionary context is that the SCs/STs together constitute the motive force of the anti-caste democratic revolution. Their unity of contradictions should not be seen as insurmountable impediments but as assets. Unless we understand the meaning of the motive force of the anti-caste democratic revolution we will not be able to know the historical task or mission of this most hapless section of the Indian people who, as averred by all historians—Dalit and non-Dalit alike—never revolted in Indian history.

Motive Force of Indian Democratic Revolution

The third estate of pre-revolutionary western European societies was denied democracy by their feudal rulers. That is why the French Revolution raised the slogan of 'Liberty, Equality and Fraternity'. The western bourgeois democratic revolutions liquidated feudalism and thereby gave democracy along with land to their respective third estates. In India not only the social reformers of the last century but even Tilak said that India lost her freedom due to the caste system and that unless the caste system is abolished she would not regain her freedom.[5] The non-Brahmin movement was in full swing during the Tilak era in Maharashtra and south India. According to the Mandal Commission's Report Ati-Sudras (22.5 per cent) and Sudras or OBCs (52 per cent) together constitute 74.5 per cent of the Indian population and are victims of the caste system. Only abolition of the caste system can give them true democracy. In the initial period of the National Congress the Social Reform Conference was held in a common pandal. Though freedom and social reform in those days were meant for the high castes/classes, nevertheless freedom and social democracy were thought to be inseparable. This was the original conception of Indian democratic revolution. But when the social reformers were driven out of Congress, this original conception fell into disuse and disrepute. Why?

All sorts of reasons are given except the basic one. According to Communist International the bourgeoisie of every country that was to make its democratic revolution became funky after the Russian socialist revolution and thereafter it became its nature to betray its own democratic revolution. But that was not the case in pre-1917 India. In that period the bourgeoisie was the motive force of every bourgeois democratic revolution. Why then did the Indian capitalist class, whose intelligentsia led the Congress, allow this to happen? Was it because it was compradore? Such a bourgeoisie does not establish its freedom organisation. Was it because it was weak? Why did it then not become strong by accepting co-operation, preferred by leaders of the Sudra peasantry like Phule and others? This question asked during the closing decades of the last century is itself the answer.

Indian capitalists are still not a class according to D R Gadgil.[6] He calls them a community, not a class. Its members are drawn exclusively from Bania castes and communities. The greatest leader of the Indian national movement was a Bania. His most powerful lieutenant was a Patel, leader of the dominant peasant caste of Gujarat, and his most popular lieutenant was a Kashmiri Brahman. Such a pseudo-class of capitalists and its intelligentsia has its interest only in political and economic emancipation and not the social one. Indian freedom movement did not usher its age of enlightenment as experienced in the west. No onslaught was launched on Indian religions, the reason being that official philosophy of the Indian National Congress was not materialism, but, from the beginning was the caste-defending monist *Vedanta*.

Bourgeois economists of India have adopted the class economy of the west. Behaviourists and stray Marxist sociologists and political scientists now feel the need for building up a caste political economy.[7] An all-sided onslaught on the caste religion of India was and is the pre-condition of Indian enlightenment not only for humanist or socialist purposes, but for bourgeois economics as well. The caste religion is based on

ownership of land by *zamindar* and peasant castes and non-ownership by the Ati-Sudra castes and communities. Hence, the abolition of feudal landholdings enacted by the central and state Congress governments and lands distributed under the various ceiling acts benefited not only affluent tenants but solely the peasant castes. SC and ST rural poor were deprived of this benefit.[8]

Class societies have one poverty line. Indian economists ape western class economics and use one poverty line for the whole country. In providing constitutional reservations for the SCs and STs it has been admitted by the rulers that the SCs and STs are the poorest and the most backward of the Indian poor. Vijay Nayak and Shailaja Prasad had to write a paper entitled 'On Levels of Living of Scheduled Castes and Scheduled Tribes'.[9] The Mandal Commission had to recommend reservation for the OBCs. The poor of the OBCs live on the second poverty line of India. And then there is the third poverty line of the poor of the forward castes. So whenever bourgeois class economists say that the poverty line has gone up to 48.13 per cent for the whole country and 50.82 per cent for its rural areas, we have to imagine—we can only do that at present—the poverty lines of the SCs/STs and the OBCs. When these class economists say that the per capita consumption of fabrics has fallen from 17 metres in the pre-independence period to 13.63 metres at present, and will go down more after the enactment of the new textile policy of the Rajiv government, we are left to imagine the clothing of the SC/ST and the OBC masses. This three-tiered depth of Indian poverty can scarcely be revealed by class statistics.

This is how the home market is developing. India has become self-sufficient in foodgrains and can now build up its reserve stocks. But there is no corresponding increase in industrial production.This crisis in industrial production is attributed by Kartik Rai, an economist of the CPI(M), to the decreasing purchasing capacity of the class of consumers.[10]

When India has the largest number of illiterates (44 crores) in the world, her live registers of employment exchanges show that in 15 years her educated unemployed has gone up from 40 lakhs to 2.5 crores. Her literacy has again to be understood in caste terms. Though the literacy rate for the whole country is 36 per cent, it is 21 per cent for the SCs and 16 per cent for the STs. The greatest sufferers are, of course, women of the SCs/STs. If the literacy rate for all Indian women is 24 per cent, it is 48 per cent for urban women and 10 per cent for rural women. Out of 281 lakh rural literate women only 17 lakh are SC literate women and 7 lakh ST literate women. SC and ST illiteracy is going to increase in the Seventh Plan period. India spends only 3 per cent of national income on education in comparison with the 6 per cent by many developing countries. Out of her total allocation for education the share of primary education is declining while the share of higher education is increasing. During the period 1950-83 primary schools increased by 2.8 per cent per year while colleges and universities increased by 6 per cent. Indian education is not only an elitist class education but also elitist caste education.

India's bonded labourers are exclusively drawn from the SC and ST. The slave market of Dholpur in Rajasthan, where SC and ST women from all over northern India are sold, flourishes right under Delhi's nose. The majority of women prostitutes belong to the SCs and STs.

The poverty, illiteracy, destitution, oppression and bondage of the SCs and STs, which constitute the base of the caste tower, remains intact; rather has been increasing in independent India. That is why the SC and ST masses are the motive force of the Indian democratic revolution.

What is the meaning of motive force in the context of Marxist terminology?

Meaning of 'Motive-Force' in Dialectical Movement

The Oxford dictionary defines 'motive' as 'a mover, instigator, promoter'. The mover of a social revolution is that section of a society that needs social revolution the most. There can be no social revolution unless the common people feel the need for it. Every social revolution is made by the common people. But this formulation leads us nowhere. The *Dasa* or slave *varna* rose in revolt against the oligarchic (*sangha-gana*) society in the 6th century BC and overthrowing *varna* society ushered the feudal *jati* society. But who promoted the social revolution? A section of the Indian people who wanted agricultural production to increase enabling thereby a spurt in handicrafts production which in turn would give a fillip to inland and overseas trade. The *Tipitaka kassaka* calls them *gahapatis* (agriculturist traders) who pay taxes to the new feudal king.[11] They and the oligarchic and feudal nobility supported Buddha and his *sangha*, who provided intellectual leadership to the social revolution. Leading *kassaka-gahapatis* like Mendaka manumitted their own predial slaves and transformed them into agricultural labourers.[12] As all revolutions preceding the socialist revolution were led by exploiters who represented the new forces of production, there was bound to be a duality of unconscious and conscious motive forces and their contradictory unity. This contradictory duality existed up to the Russian socialist revolution. After it Marxist-Leninist political economy enabled the unconscious motive force of the peasantry to be transformed into a conscious and hegemonic force in alliance with the working class in a democratic revolution. In the Chinese New Democratic Revolution, as noted by the history of the CPC, the Chinese compradore bourgeoisie was a counter-revolutionary force and the Chinese working class could have no links with it and hence the role of the conscious and hegemonic motive force was played solely by the poor peasantry.

Not only the international communist movement but even the CPC has tried to explain away this sharp departure with the jargon of the Marxist-Leninist theory of democratic revolution. It is argued that Marxism-Leninism being the ideology of the working class the peasant revolutionaries of China were acting as the representatives of the Chinese working class!

A new revolutionary reality confronts us in a sharp divergence from the revolutionary theory. An exploited section of a people, which is the greatest victim of the semi-feudal order and needs the democratic revolution the most, need not be fatalistically led by their working class but can itself become the conscious and hegemonically motive force of its democratic revolution. *Revolutionary realities far removed from each other in time, space and character need not and do not strictly follow the lines laid down by a revolutionary theory.*

In spite of its unique peculiarities the Indian democratic revolution has some similarities with the Chinese New Democratic Revolution: (1) The Chinese bourgeoisie being a compradore one, opposed the Chinese democratic revolution. The Indian bourgeoisie, being a high caste one, opposed the Indian anti-caste democratic revolution. (2) The Indian working class, as noted by Ambedkar,[13] itself being caste-ridden has not been able to discharge its historic task of becoming the conscious and hegemonically motive force of the Indian democratic revolution. (3) The SC and ST masses, being the greatest victims of the caste system, are bound to become the conscious and hegemonically motive force of the Indian democratic revolution.

But according to formal logic the caste system can be abolished only through anti-caste struggles, i e, struggles, broadly, between the SCs/STs on the one hand and all the rest of the castes and communities on the other. That is how traditional communist parties twist the meaning of anti-caste struggle and that is also how S D Mahajan, a socialist and a member of the Anti-Namantar Committee, wrote in his article opposing the demand for renaming the Marathawada University after Ambedkar.[14]

So the question naturally arises: what is the relation of anti-caste struggle to class struggle?

Relation of Anti-Caste Struggle to Class Struggle

In order to understand the modern character of anti-caste struggle, it will have to be compared with pre-British anti-caste struggles. Marxist historians like D D Kosambi, Dev Raj Chanana, R S Sharma and Romila Thapar characterise social strug-

gles in the pre-British Indian society as class struggles that took the form of caste and community struggles. I have challenged all Indologists to prove the existence of class in pre-British India. Marx did not know any other institution of exploitation and administration except class. Tremendous advance has been made in the post-Marx period by anthropology, sociology, historiography, archaeology and linguistics. Angela Davis says in *Women, Race and Class* that race is as much an institution of exploitation and administration as class. The newly independent countries of Africa are federations of tribes and tribe itself is an institution of exploitation and administration. In the pre-Buddha period *varna* was the institution of exploitation and administration, while in the post-Buddha period *jati* became the institution of exploitation and administration. The history of Vedic (pre-Buddha) Indian society since the rise of the exploitative *varna* system is the history of *varna* struggles, while the history of the post-Buddha Indian society right up to the advent of the British is the history of *jati* and community struggles.

The religion of *varna* society was *Srauta* (Vedic) *varnaasrama*, while that of *jati* society has been *Smarta* (of *Smriti*). The Srauta-Smarta religions together constitute the Brahmanical religion. Philosophies upholding this religion were called Brahmanical philosophies by Indian tradition, while philosophies opposing this religion were called non-Brahmanical ones by the same tradition. Vedanta, Purva-mimamsa, Nyaya and Vaiseshika were Brahmanical philosophies, while Sankhya, Lokayata, Jaina and Baud-dha were non-Brahmanical ones. The struggle between these two philosophical camps was basically a projection of the anti-caste struggles that were fought out in the society right since the time when the exploitative varna system came into existence in the Indus civilisation. My papers: 'Two Marxist Methodologies of Understanding Ideological and Social Conflicts in Indian Philosophy'[15] and '*Dharmakirti* and Our Times'[16] which have not been published in English so far, deal with this subject. Anti-caste struggles were waged even in the Brahmanical camp. The Bhakti movement is an example of it. In the absence of any notion of class and though fought out under a religious garb, these anti-caste struggles were secular and not casteist or communal. *Traditional communists are still victims of the misconception that only class struggles are secular, non-casteist and non-communal.*

The British rulers transplanted their class system on the Indian caste system. They modified the caste system in their class interests, but preserved it also in their class interests. That is why economic, social and political struggles were imbued with caste consciousness and conducted through caste organisations. Even the working class struggle in Bombay was waged, up to the close of the first world war, by leaders of the non-Brahman movement like Lokhande. The non-Brahman movement in Maharashtra waged its anti-caste, anti-religion, anti-priesthood and anti-usurer-landlord struggles against the castes of bhatjis (Brahmans) and shetjis (Bania) with a caste consciousness and caste organisations. Even in the national movement its high caste leaders steered their own caste and sub-caste organisations outside the National Congress. Sardar Patel led his Patidars' caste organisation. He was in the forefront in opposing and scuttling the Hindu Code Bill drafted by Ambedkar. If the pre-first-world-war working class movement and the national movement as a whole are characterised as secular, then the non-Brahman movement led by Phule, Shahu, Jadhav, Jedhe, Javalkar and Periyar also must be characterised as secular. It was not the fault of the non-Brahman agitations that religion, land, trade and usury were vested exclusively in the hands of particular castes. The caste religion itself was responsible for that.

Though Ambedkar was steeped in western class democratic traditions, when he unfurled the banner of caste annihilation on behalf of the untouchables in a completely uncasteist spirit, he found all the caste Hindus ranged against it. A sprinkling of high caste individuals who supported him makes no difference. Even the Namantar struggle of the period 1978-82 saw the overwhelming participation of Dalits and Adivasis, while caste Hindus were in an insignificant minority. This happened in the heyday of communist class struggle.

It is against this background that we must see the relation between caste struggle and class struggle. For unilinear historical materialism there is no relation between the two. For it the two are one! According to Dipankar Gupta, whose elucidation of traditional Marxism is acceptable to all communist parties ranging from CPI(M) to CPI(ML), caste is a myth and class is the only reality,[17] in the spirit of Sankara monist Vedanta—*Brahma satyam, jagat mithya* (only *Brahma* is real, the world is false). Gail Omvedt does not take such a crude position. According to her class inhered in caste in an unmanifested form in the pre-British Indian society, it became manifest in it in the colonial society and since independence the two have become separate.[18] But this was her position in 1982. In her most recent position in 1983 she repeats Marx's dictum: "Wherever there are exploitative relations of production, wherever one section of society toils and produces but is deprived of the fruits of their production while another section of society does not labour but exercises control over the means of production and appropriates what is produced—there are classes".[19] Hence, class is the only reality!

Ambedkar, influenced on the one hand by S V Ketkar[20] and on the other by Marx's unilinear historical materialism, defines caste as 'an enclosed class', and prefaces it by saying that every exploitative society is bound to be a class society and Hindu society is no exception to it.[21] It should be noted that this is still an inviolable dogma not only with Ambedkarites but even with the distinguished Dalit thinker Raosaheb Kasbe who fervently and ably espouses a combination of Ambedkarism and Marxism in his book *Ambedkar and Marx*.[22]

In contradiction to these Marxist and Ambedkarist unilinear viewpoints, multi-linear historical materialism expounded by 'Marxism-Phule-Ambedkarism' demonstrates that race,[23] *tribe,*[24] *varna and jati are pre-class institutions of exploitation and administration. It not only enables separate, comparative and objective studies of societies that had or have these institutions of exploitation and administration, but also shows the present relation of caste and class struggles in their real concatenations.*

Class is the highest and the last institution of exploitation and administration. Though the British imperialist rulers preserved caste in order to perpetuate their class, abolition of caste is unimaginable without the growth of class in it. In the post-independence period even those backward castes and communities, including SCs and STs which were homogeneous, have *differentiated* into classes. This has made class struggle within SCs and STs possible. The rise of Dalit Panther, Dalit Yuvak Aghadi, etc, through revolt of the Dalit youth against the elite leadership of various republican parties, is the first manifestation of class struggle within Dalit castes. Though the movement of the Adivasi landless in Dhule district for cultivable forest lands, organised by the Satyashodhak Communist Party since 1970, is directed against the Maharashtra state government, its forest minister Surupsingh Naik and the M P Reshma Bhoge being the leaders of the ST elite from the same area, the movement had to wage class stuggle within the scheduled tribes involved in the movement.

Except the SCP all the other constituents of the Namantar Kriti Samiti were Dalit and non-Dalit non-parliamentary action groups. The agreed strategy was to unite the democratic and toiling classes of all castes and communities against the Congress(I), whose state government was refusing to concede the demand, and the BJP, premier party of the caste system. It was an anti-caste struggle that was waged on the basis of class unity of democratic and toiling masses of all castes and communities. This is a model meant for all future anti-caste struggles.

Satyashodhak Gramin Kashtakari Sabha is the class organisation of the toiling peasantry led by the SCP. It is waging various economic and class struggles of the Adivasi and Sahu toiling peasantry. While waging these class struggles it has participated in the great Namantar Satyagrahas of 1979 and 1982 with full force. It resulted in mutual strengthening of both struggles and helped in developing the anti-caste, class democratic and socialist consciousness of the Adivasi

and Sahu masses following the class organisation.

This was one of the main points of dispute in the CPI(M) when the founders of the SCP were in that party. Godavari Parulekar, the president of the Maharashtra Kisan Sabha, justified the holding of a Maharashtra Adivasi Conference at Talasari, Thane District, between February 1-4, 1974, on the plea that there should be a separate organisation for waging caste struggles as there is a Kisan Sabha to wage class struggles. We opposed the move by arguing that class organisations of workers, peasants, middle class, students and women should themselves be simultaneously oriented towards caste struggles. This dichotomy of separate class and caste organisations by the Maharashtra CPI(M) leadership proved to be impracticable and fell through.

A corollary to the dispute was: what about the existing caste and community organisations respectively of the Dalits and Adivasis? We argued that the SC/ST masses had to form organisations for their anti-caste demands and hence communists should forge an alliance with them for waging not only anti-caste struggles but also class struggles. History has proved us right. CPI and CPI(M) had to participate in the Namantar Satyagrahas of 1979 and 1982, though in a token manner, i e, without their class organisations, and became constituents of the Maharashtra State Committee for Defence of Reservation (for the OBC) right since its inception. Popular pressure has forced these traditional communist parties to establish a relation between their class struggle and these caste struggles.

But the hitch is that they continue to consider these anti-caste movements as 'necessary evils', as challenges to the class unity of toilers.[25] Hence, their token participation in these anti-caste movements. That sets a limit on the mobilisation of their party and non-party SC/ST masses for these movements. No battle can be won by an army whose important contingents are ideologically unconvinced and hence offer a token fight.

What is the relation of caste and class struggles with women's struggle—especially of SC/ST—against sexual inequality and oppression? Women's emancipation movement in India is no longer limited to Hindu urban middle class women. It is spreading to women of all religions and going down to rural grassroots. Advocate Indira Jaisingh argues "No community, religious group, caste or sect can claim that their own sectarian law must be protected against the constitutional guarantee of equality between the sexes . . .". Today there are no less than five petitions pending in the Supreme Court from women belonging to five different religions and ethnic groups. Mary Roy from Kerala has challenged the Travancore Christian Succession Act, 1916, as it disentitles Christian women from inheriting any property from their fathers. A Hindu woman has challenged the Hindu Succession Act as it excludes women from succession to ancestral or co-parcenary property and the family home. Shehnaaz Sheikh has challenged several aspects of Muslim Personal Law, including the arbitrary nature of *talak*, as it denies Muslim women sexual equality. Another Chirstian woman has challenged the limited grounds on which a Christian woman can seek her divorce under the Indian Divorce Act. There is a petition pending on behalf of tribal women challenging the custom that disentitles them from inheriting property belonging to the father or the husband. Adivasi women from Maharashtra, through the Satyashodhak Kashtakari Mahila Sabha will be shortly filing a petition in the high court challenging the tribal customs and the Hindu Succession and Indian Succession Acts, both of which exclude scheduled tribes from their purview'.[26]

It should be noted that out of all these petitions only the last is being filed on behalf of a grassroots women's organisation, while all the rest are by individual women, though there might be some urban middle class women's organisations helping the petitioners. The founders of SKMS faced stiff opposition from Godavari Parulekar in their efforts to persuade CPI(M) leadership to build an all-India tribal women's movement against various customary laws which permit polygamy for tribal men, disentitle tribal women to maintenance after divorce due to the custom of bride price, disqualify them from inheriting father's property, etc. Says the policy statement of the SCP:

> The Hindu code is still not applicable to the Adivasis even in the truncated form in which it was passed by the parliament. Hence, Adivasi women have been deprived of the legal benefits of the act of marriage which prohibits a man to take a second wife when his first wife is living, and the act of succession which entitles a woman to an equal share in her father's property, etc. The resolution of the 'Dhule Zilla Shramik Mahila Sangh' demanding the application of the Hindu code to Adivasi women was turned down by the CPI(M) leader of women Ahilya Ranganekar, MP and the CPI(M) Adivasi leader Godavari Parulekar under the plea—"Adivasi women are more free than Sahu women and hence their rights will be marred if Hindu code is applied to them!"[27]

The task of filing the above-mentioned petition has been entrusted to advocate Indira Jaisingh by the SKMS.

Again the question props up: Who are the motive force of Indian women's emancipation movement? The Tebhaga (⅓ share of the crop as rent instead of ½) movement of 1946-50 in Bengal was as great an anti-feudal peasant uprising as the Telengana. A participant in that movement, Amit Kumar Gupta, writing in his 'Mobilising Women for Change' notes that women were more militant than men and one of the reasons of their greater militancy was that they hailed mostly from the SC and ST. The second reasons he gives is that "they were doubly oppressed; they were exploited not only on a class basis but also on a sex basis".[28] He is careful to note that "Higher caste Hindu and Muslim women did not participate to the same extent", though he excludes caste oppression. The constitution of the Satyashodhak Kashtakari Mahila Sabha says that Indian women are bound by the triple bonds of sexual, caste and class inequalities. The greatest victims of this triple bondage are of course the SC and ST women and hence they are the motive force of Indian women's emancipation movement.

Refusal by the CPI and CPI(M) to give due importance to caste in women's emancipation imposes limits on their mobilisation of the SC and ST women.

Primitive communism sketched by Morgan and Engels is based on total—including sexual—equality. They stop therein at mother-right which is exercised by men in mother's line. Actually it is a matrilineal society. Bachofen, who was the first to detect gynocracy in ancient European society, considered it an abnormal and distorted development of primitive matrilineal society and Morgan and Engels concurred with him. Briffault and George Thomson have proved that matrilineality was a product of gynocracy. In my book *Dasaudra Slavery* (p 1) I have adduced Indian illustrations to prove the existence of gynocracies in India right from the Indus civilisation to modern times.[29] But, nevertheless, Indian traditional communists and Marxist scholars continue to cling to the non-existent and romantic conception of primitive communism in ancient India. This has made even women communist leaders of India patriarchal! As a result, women's emancipation movement in India has become subordinate to men's emancipation movement in spite of tall and extreme talk of feminism.

Revolutionary Mobilisation of the SC/ST?

The last question that remains to be answered is: Will the SC/ST masses have to be mobilised for a revolutionary abolition of the caste system? For traditional communists the task is not abolition of the caste *system* but *vestiges of caste* which belong to the superstructure, i e, in the minds of the Indian people. Hence the task has been relegated to the post-socialist revolutionary period by the programmes of all traditional Indian communist parties, including CPI(ML). The final phase of the anti-caste movement raised a challenge to this understanding and a debate I initiated in the 1970s on all the aspects and concatenations of the unique Indian democratic revolution compelled the foremost theoretician of the CPI(M), M Basavapunnaiah, to raise the traditional understanding to the level of a philosophical debate in his paper 'On Contradictions, Antagonistic and Non-

Antagonistic' in the Marx centenary issue of the *Social Scientist* (March 1983). My rejoinder to him entitled 'Lenin, Mao and Basavapunnaiah on Contradictions: Antagonistic and Non-Antagonistic' was not published by the theoretical monthly of the CPI(M) though the editor had called for a debate in the journal. Hence, my rejoinder had to be translated in Marathi and published in *Satyashodhak Marx-Vadi* (December 1983).

Basavapunnaiah's paper was a rebuttal of the departure taken by Mao—without being conscious of it—in interpreting the law of contradiction in order to apply it to the contradictions posed for solution by various movements in the Chinese society.[30] What is the position taken by classical Marxism, which ends with the so-called Marxism-Leninism, on the basic law of dialectics according to Basavapunnaiah? (Though Lenin interpreted the law dogmatically, I have shown in my rejoinder that Marx had left the options open.) (1) There were only non-antagonistic contradictions in human society till the disintegration of the primitive communist society. (2) With the disintegration of the primitive communist society there came into existence two types of contradictions—antagonistic and non-antagonistic. He stressed that there were no antagonistic contradictions in this ideal society. (3) Only the class contradiction is an antagonistic one, while the rest of the social contradictions are non-antagonistic. (4) Both these types of social contradictions are untransformable into each other and they exist in watertight compartments. (5) Only the class contradiction can be resolved in a revolutionary manner.

The main departure taken by Mao was that antagonistic and non-antagonistic contradictions do not exist in watertight compartments and can get transformed into each other and class contradiction in its initial stage exists in a non-antagonistic form.[31] This meant in the Indian context that caste contradiction also is and can be an antagonistic contradiction and hence its revolutionary resolution becomes necessary.

Elite nationalists like N V Gadgil had convinced leaders of the non-Brahman movement like Jedhe that as caste contradiction would be resolved only after attainment of freedom the non-Brahman movement should enter the Congress and give priority to the struggle against the British.[32] In the same manner traditional communist parties argue that *caste* being a superstructural or non-antagonistic contradiction it will be automatically resolved after the resolution of the antagonistic class contradiction through the socialist revolution. (Sharad Joshi argues in the same vein: the main contradiction in Indian society being Indian government's refusal to give remunerative prices for agricultural produce to the peasantry, all other contradictions in Indian society will be automatically resolved with the resolution of the main contradiction.) The various brands of democratic revolutions propagated by traditional Indian communist parties (except parties and organisations like Lal Nishan Party and Shramik Mukti Dal who want to go over immediately to the socialist revolution) being exclusively class ones and their underlying philosophical understanding being as described above, they are against mobilising the ST/SC masses for a programmatic revolutionary strategy of the Indian democratic revolution that would abolish the caste system simultaneously with the implementation of agrarian reforms and switch over to the socialist revolution.

Thus, on the revolutionary mobilisation of the SC/ST masses depends the success of the total Indian revolution that would abolish caste, sexual and class inequalities.

Notes

1 Sahu is a *Prakrit word. The executioner Candalas tell Rohasena, the child of Carudatta, in the Sanskrit drama Mrcchakatika*, that it was not they but the Sahus (well born) who were executing Carudatta. *Mrcchakatika*, Act X.

Oilseeds: Is Higher Price the Answer?

Ashok Gulati

Edible Oilseeds: Growth, Area Responses and Prospects in India by K N Ninan; Oxford and IBH Publishing Co, New Delhi, 1989; pp xvi + 301, Rs 150.

IMPORTS of edible oils being one-third of domestic production and the annual import bill on this account having crossed Rs 1,000 crore during 1980s have caused anxiety in policy-making circles. The concern is three-fold: (1) need for self-reliance; (2) need for conserving scarce foreign exchange; and (3) need for a balanced cropping pattern. Accordingly, the oilseeds sector has lately received a high priority with the setting up of the Technology Mission on Oilseeds in May 1986. Efforts are being made to boost oilseeds production by all possible means ranging from evolving high yielding varieties to more remunerative prices. The National Dairy Development Board (NDDB) has been assigned an important role in restructuring the edible oil economy on the 'Anand pattern' as well as to keep the oil prices within a specified 'price band'. Recently emphasis seems to have shifted more towards the price instrument with a view to providing higher incentives to oilseed cultivators.

It is against this policy environment that Ninan's book on edible oilseeds is a timely contribution. The book carries a detailed examination of the growth behaviour of major edible oilseeds—groundnut, sesamum, rapeseed-mustard, safflower, niger, sunflower and soybean—over the period 1954-55 to early 1980s with sub-groupings for the pre- and post-green revolution period. Regionally, it covers all the major oilseed growing states separately for each oilseed under study. Spread over 150 pages (chapters 2 and 3), this analysis is quite comprehensive but at the same time suffers from a lot of repetition. This happens as a result of several time-period groupings that the author experiments with for finding out the growth behaviour. For example, even for the post-green revolution period, he estimates state and oilseed specific growth rates for 1967-68 to 1981-82, 1967-68 to 1983-84, 1973-74 to 1981-82 and 1973-74 to 1983-84. While this type of sensitivity analysis of growth behaviour may have its utility for the scholar undertaking research, presenting all these results in the book and then commenting on each one comes in the way of readability.

The upshot of this exercise on growth behaviour, however, is that in case of most oilseeds, the primary source of growth has been area expansion. Yields have stagnated over a long period, except in the case of rapeseed-mustard where it showed a growth rate of 1.43 per cent per annum over 1954-55 to 1983-84 and safflower which experienced a yield growth rate of 7.17 per cent per annum over 1967-68 to 1983-84. With the finding that area has been the dominant source of growth in edible oilseed production, the author proceeds further to explore the factors that influence the area response of three major oilseeds—groundnut, sesamum and rapeseed-mustard (chapters 4 to 6). The Nerlovian model of partial area adjustment with static price expectations is adopted for this part of the enquiry. As per the reduced form of Nerlovian model area under specific oilseed crop in period t depends upon the lagged relative prices and yields of that oilseed to its competing crop, relative price and yield risks, rainfall, gross irrigated area under all crops and the lagged (t- 1) area under that oilseed itself. This reduced form is estimated through OLS technique over three periods: (a) 1955-56 to 1981-82, (b) 1955-56 to 1964-65, and (c) 1967-68 to 1981-82. This exercise is carried out at state level experimenting with different competing crops of the main oilseed and also with relative revenue (price multiplied by yield) variable in place of relative price and yield variables separately. States were grouped into three categories depending upon their experience in area growth, i e, area increasing states, area decreasing states and area stagnant states.

The results of this econometric exercise are not very encouraging. Most of the estimated coefficients are either statistically insignificant at 10 per cent level or many of them have wrong signs. This is particularly true of those states that experienced area declines or area stagnation. Irrigation seemed to work to the detriment of oilseeds in these states indicating that with the spread of irrigation, these states lost oilseed area to their competing crops. It was only in area increasing states that relative yields or relative revenues turned out to be somewhat statistically significant. The relative price variable does not turn out to be very important in major oilseed producing states. For example, in case of groundnut in Gujarat—an area increasing state—out of nine equations estimated with relative price variable taking jowar, bajra and cotton as competing crops, none of the relative price coefficient is statistically significant at 10 per cent level (pp 179-180). Andhra Pradesh, the second largest groundnut producing state, is omitted from this analysis. One wonders why. In Tamil Nadu, the next important groundnut producing state, relative price coefficient provides a wrong sign when either bajra or cotton is taken as the competing crop (p 204). Five out of six of these coefficients are statistically insignificant at 10 per cent level. Similarly in case of rapeseed-mustard in Uttar Pradesh, relative price is not important in any of the equations when barley is taken as the competing crop. But when wheat is treated as the competing crop, it is only in pre-green revolution period (1955-56 to 1964-65) that this coefficient is statistically significant at 10 per cent (p 260). In Rajasthan, the next important rapeseed-mustard growing state, results are no better. With barley taken as competing crop, none of the three equations provides a statistically significant coefficient (at 10 per cent) of relative price variable. When wheat is treated as the competing crop, coefficient is significant at 5 per cent for the period 1955-56 to 1982, but not so even at 10 per cent for either of the two sub-periods 1955-56 to 1964-65 or 1967-68 to 1981-82 (p 245). In case of sesamum in Uttar Pradesh, for the post-green revolution period, relative price is unimportant when either jowar or bajra is taken as the competing crop (p 217). For the pre-green revolution period, it gives a negative sign, while for the overall period 1954-55 to 1981-82, it gives positive and statistically significant coefficients. In Rajasthan, the next important sesamum producing state, the relative price coefficient remains statistically insignificant at 10 per cent when maize is taken as the competing crop, for any of the three period groupings. If cotton is taken as the competing crop, the results remain insignificant for the pre- and post-green revolution periods (separately) but become statistically significant at 10 per cent for the overall period from 1954-55 to 1981-82. Thus, the overall thrust of these findings obtained through the Nerlovian model remains that relative prices do not play an important role in influencing area shifts in favour of oilseeds. Does this imply that any increase in oilseed prices, especially when it is almost assured by the government as in its January 1989 policy announcement of 'price band', will have no effect on area under oilseeds? Perhaps, the author too would not agree to this. It is here that one has to realise the limitations of analysis carried out through the Nerlovian frame-

work and its implications for policy. Given the rationality of Indian farmers, what is perhaps required for policy analysis would be the estimation of 'switch points', i e, the levels of prices or yields at which farmers would switch to oilseeds from their competing crops. This analysis would be of even greater use if it is carried out at the district level because state-level analysis often hides the emerging trends in switches that are often quite strong in some districts but get diluted due to opposite switches in some other. In this context, it is worth noting the analysis carried out by the Study Group on Agricultural Price Policy for Balanced Development of Agriculture headed by C H Hanumantha Rao (Government of India, 1986). The study group found that "with the fixation of administered price of wheat at Rs 162 per quintal and that of rapeseed/mustard at Rs 400 per quintal, the cultivation of rapeseed/mustard would give the same amount of income to the farmer as he can obtain from cultivation of wheat in areas where the wheat yields are less than or equal to around 2.5 times that of rapeseed/mustard" (pp 8-9). The group found that there were a large number of districts in Assam, Gujarat, Rajasthan and Uttar Pradesh where, on an average, wheat yields were less than 2.5 times the mustard yields. These are the districts where higher relative prices of rapeseed-mustard would induce a switch in area in favour of oilseeds. A similar exercise was done by the group for rabi groundnut versus summer paddy where it found that given the relative prices and yield levels, area would switch in favour of rabi groundnut in those districts where summer rice yields were less than 1.72 times the groundnut (rabi) yields. The group also opined that it would be necessary from time to time to identify the regions at a disaggregated level where such substitution between crops would become possible either through the better extension of profitable technologies or through the changes in relative prices that are considered desirable in the light of changes in international prices of the commodities concerned.

Almost a similar work has been done by S S Johl, the present chairman of the Commission for Agricultural Costs and Prices, in his study on Pricing Policy for Oilseed Crops in India (1988) where he estimates the degree of comparative disadvantage of different oilseeds *vis-a-vis* their competing crops in various states. It is this type of analysis which is required to evaluate the policy options of raising relative prices or yields so that oilseeds production is raised to desired levels with cost effectiveness.

But the author instead opts for a Nerlovian type analysis and then digresses on policy options of prices and technology. Obviously his prescription in favour of technology, though correct, remains more of a qualitative nature with limited use for policy analysis. However, I must say, the author has done sufficiently detailed work on the growth behaviour which anyone concerned with Indian oilseeds sector today must take advantage of.

Strategies for Public Health: Promoting Health and Preventing Disease, edited by Lorenz K Y Ng and Devra Lee Davis; Van Nostrand Reinhold Co, New York, 1981; pp viii-416, $ 8.95.

HUMAN health is a vital component of life especially in the context of new developments and advances in modern health care. Health is a 'positive' concept emerging out of a 'negative' definition of a logical reasoning—a state in which an individual is *not suffering* from sickness.

The growth of modern medicine especially since the early 20th century is believed to have contributed to a decline in morbidity and mortality leading to good health. Ordinarily the episodic view of disease has been widely prevalent in approaches to achieve health. But there appears to be a paradox when one views the issues through the traditional understanding of life and death, the incidence of sickness and schemes of healing. The traditionaly emphasis is on the integration of body and soul on the one hand, and elimination of a particular type of sickness from its base on the other. Is this contradiction only an artefact of the blending of tradition with modern medicine? Or is it that we have wrongly understood the very competence of medicine? Or is it that the limits to modern medicine are fixed a bit too far in terms of what it can achieve?

This book, which is a collection of 26 articles explores various conceptual, practical and organisational dimensions of health, which helps in addressing the above questions. The phrase 'public health' has been used in a much wider context than is normally understood in modern day India. This monograph should interest all who are concerned with public health. More specifically it is invaluable to those who are interested in public health, environmental health, occupational health and economics of health care. Health economists, sociologists, demographers, health planners, medical and paramedical professionals and trade unionists will also benefit from this volume. The 26 essays are placed in five sections. The editors have presented an overview in Section 1, followed by Section 2—Health Enhancement, stress and wellness; Section 3—Risks and Prevention; Section 4—Insurance Issues and Section 5—Health Promotion: Action and Strategies.

The framework in which this book discusses issues, draws support, and provides conclusions, falls within the present day health regime of the western world. Nonetheless, the amazing fact is that the issues and conclusions are relevant even within the context of present day India—an India in which the structure, nature and distribution of both morbidity and mortality are very different from the west, besides being too high.

The one conclusion which runs through the various articles in this volume is that, modern (beginning 20th century) inventions in medicine and the breakthrough in health care technology has neither a history in reducing nor has an ability to reduce morbidity and mortality on its own. Even preventive intervention in the form of immunisations do not have historical support of its success. Rather practically all immunisable diseases in the west were reduced to a very low level purely by the positive forces of social change through improvements in hygiene and sanitation. For example, only an estimated 3.5 per cent of the decline in mortality in influenza, pneumonia, diphtheria, whooping cough and poliomyelitis in the US since 1900 has been attributed to specific medical measures (p 6). Thus, the incidence of, and death rates from, these diseases had declined before medical interventions become widespread (p 7). One purpose of this volume is to emphasise the environmental factors, which have become so very important in the present day industrial conditions. The introductory discussion also highlights a contradiction leading to an approach which is partial towards an over emphasis on investments in health care delivery (over 80 per cent of public health funds in US), whereas this sector is found to be just about 20 per cent responsible to guarantee success in improving health. A strong plea has been made to reconsider the whole question of strategies for health in a holistic and systemic framework.

Great Equation, Holistic Medicine and Self-Help

Of the eight papers in Section 2, the editors L K Y Ng and D L Davis along with Manderscheid and Elkes have presented a very useful framework in their article—Toward a conceptual formulation of health and well-being. Besides, a discussion on the definition of health as absence of illness, they have laid the limits to the bio-medical model of health. They write,

> It is an irony of history that at the very time that we are witnessing major strides in molecular biology and genetic research, we are simultaneously experiencing a crisis of confidence in the ability of medical science to improve the health status of our post-industrialised society.

They quote Wildavsky who has said that the 'Great Equation' medical care equals health is wrong.

> More available medical care does not equal better health. The best estimates are that the medical system (doctors, drugs, hospitals) affects about ten per cent of the usual indices of measuring health: whether you live at all (infant mortality), how well you live (days lost due to sickness), how long you live (adult mortality). The remaining 90 per cent are determined by factors over which doctors have little or no control, . . .

They emphasise that the critical factors contributing to morbidity and mortality relate as much, if not more, to behavioural, social and environmental factors, as they do to the quality of medical care system (p 47). The subsequent part of the paper has dealt with the formulation of the 'wellness model of health'.

P J Rosch's paper extends the arguments as found in the Ng et al to what he calls the 'Holistic Medicine' which focuses on 'wellness' rather than only to absence of disease. While doing so the author presents a lack of health in five levels, viz, dissatisfaction, discomfort, disability, overt disease and death or dying. In the evolution of medicine it is said, healing has become only an expertise (business) from what it was, an art. There is also a discussion on the impersonalisation process in the approach of health practitioners. K W Sehnert argues that there is a need for the re-emergence of the medical self-care movement, and suggests a 'Dual System' as it used to be during middle ages. The emphasis, however, is on the individual's reliance on self-medication through popular books on lay, but useful, concepts of health and medical care. He advocates elimination of doctor-dependency. This is a very important dimension as far as the future growth of health care in India is concerned. The question is can we in India evolve a conceptual regime from those indigenous and traditional practices which are consistent with the factual and scientific concepts of cause and effect in disease and health. The author, however, emphasises the usefulness of public courses on topics such as 'your medicine chest: friend or foe', 'listening to your body' 'talking with your doctor' 'yoga and you', and 'here's hoping your are coping'. The useful tips offered are—the acceptance of more individual responsibility for self care and care of the family; acquisition of the skills of observation, description, and handling common illness; increasing basic knowledge about health problems; learning economic use of health care resources (p 91).

The other papers in this section deal with issues such as stress, behavioural medicine and environmental hazards to health. The highlight of the articles is the recognition that the influences of biological stress on the lives of individuals as well as entire societies are enormous, in the current regime of morbidity in the west. But an important dimension which emerges is related to what is termed as 'general adaptation syndrome' in which the human body gears itself to withstand stress through adaptation process (p 38). This is an important bio-medical dimension in the management of illness. But there is a different psychological dimension of illness worth branding a similar title—'adaptation syndrome'—which prevails in a tradition bound society such as India. If the illness is chronic and persists with all its capacity to cause pain and inconvenience, the patient will, over a period of time, resign himself to a situation in which he views the

disease as given and becomes mentally adapted to bear and live with the suffering. Such a dimension of illness has not been conceived of at least in the western model of health. Yet a similar process of internalised behaviour is suggested to be useful in health care, which may take place even before the onset of illness as suggested by Elkes (p 74).

HEALTH HAZARDS—KNOWLEDGE A CIVIL RIGHT

There are five articles in Section 3 which discuss issues relating to risks and prevention of sickness. In their article D L Davis and D P Rall extensively review the possible risks of various sickness on the one hand and the risks due to certain chemicals which have hazardous effects on human health on the other. A good discussion is presented on the risk factors emerging from various types of work place-associated chemical-based hazards. Stephanie Harris, while presenting positive benefits on breast-feeding warns against the increasing threat of human milk contamination due to organochlorines, making infants susceptible to disease. This is a timely warning especially when pesticides are increasingly used in agriculture. The artificial feeds given to meat and milk producing ruminants, it has been found, leads to the transfer of organochlorines into the human body which finally reach infants through human milk. This matter is a timely warning demanding definite policy interventions in India. The author has suggested that reduction in fat-soluble chemicals can be achieved by dietary control, mostly avoiding eating foods which are most likely to contain traces of detrimental chemicals. It has been suggested that the consumption of a certain type of fresh water fish be avoided to minimise intake of harmful polychlorinated biphenyls. Likewise abstinence from highfat meats and chickens is advised so as to reduce organochlorines. There has been some support (not yet conclusive) for the hypothesis that vegetarians in the US have lower levels of pesticides in their breast-milk.

An important paper by Vilma Hunt which will enlighten both trade unionists and industrialists deals with 'the emergence of the workers' rights to know health risks'. The right to know of hazards in the environment—whether the work environment or otherwise—is a fundamental civil right. But in the context of industrialisation what is relevant is, '...offering to the poor who need it most the knowledge and the power which have long been the possession of those who need it least' (p 179). Emphasis is placed on the need for a regulatory regime of control over the hazards due to use/production of goods with lead, phosphorus and toxic substances emanating from radio-active elements. Nevertheless, in the Indian set-up we are aware that there is no responsibility (which has legal implications) as yet fixed on the employer to publicise the health and safety risk of workplace, thus infringing on the civil rights of the employees. In the context of accelerated industrialisation, India should consider the legal and ethical issues relating to occupational hazards.

Although this book is located in the context of the US, what is revealing is the suggestion by various authors for public intervention in order to highlight or even regulate the various aspects of health hazards. This clearly indicates the possible failure of the market forces to deal with situations which have clear social welfare implications. In fact, E C Nelson, A M Keller and Michael Zubkoff go so far as to suggest incentives for health promotion by governments even in the context of the industrialised world, which is largely dependent on market forces in the other sectors of economy.

CO-OPERATIVE EFFORTS IN HEALTH CARE

Section 4 deals with 'insurance issues'. Of the five articles in this section four are specific to national health insurance schemes and health promotion. The discussions in these papers are more relevant to those countries which already have definite health insurance plans for the general public, a situation which does not exist in India. The other article on 'health promotion strategies for unionised workers, by Joann Grozuczak, emphasises the fact that health promotion is not fully efficient at the individual level and that there is much in the realm of preventive health care that groups might accomplish (p 235). A clearly defined and homogeneous group of industrial workers under an umbrella of trade unions can accomplish good results. Efforts at prevention of disease in the workplace have been in vogue since the great depression in the US, and lately the WHO has been more vocal in propagating this dimension of health care in other countries. Occupational health strategies are becoming more up to date to bring under its purview hazards caused by such things as X-rays, toxic substances and asbestos. But it is disheartening to note that development in this direction in India is limited to the Employees State Insurance Scheme, which does not consider relief related to specific type of industry or hazardous substances causing disease. An important feature, with reference to occupational health is that occupation-related diseases do not occur randomly, rather it will affect all who work with a particular industry or who work closer to the hazardous material.

The fifth and final section of this book is titled 'Health Promotion: Action and Strategies'. Seven of the eight papers are in the form of case studies on issues such as obesity, control of cardiovascular disesase through an action programme, employees' fitness in workplace, health education, mental health programmes and preventive health campaign. J H Proctor's paper which introduces an useful concept of information co-operatives in primary health care suggests 'linking people together so that they can take more active informed roles in preventing illness and injury' (p 379) through the formation of information co-operatives. The emphasis is to be on planning and local level organised interaction between the different types of health providers on the one side, and between the providers and general public on the other, through participative contacts. Three shifts in attitudes are suggested: (1) Individual accountability—a 'shift away from the passive, reactive consumption of health services towards an active, involved self-help perspective...'; (2) Institutional objectives—a 'shift away from the health care delivery institutions' efforts to preserve their identities' or concealment of information and concentration of power; and (3) Information sharing—a 'shift away from episodic and haphazard access to health information towards one which shares health information among citizens and health care providers'. The author calls for a 'hype' to inject a bit of earnestness into action. Hype covers a type of modern one-way (aggressive) communication designed to persuade, sell, or cause action 'prevention as the 'what' of our goal. An energetic, multi-levelled, participative promotion campaign is the initial 'how', and healthier citizens at lower costs is the 'why'. The big questions are 'who' and 'when'.

Aspects of the World Capitalist Economy in the 1980s

Prabhat Patnaik

Economic booms, characterised by rapid capital accumulation and a plethora of new processes and new products, are founded on crises, which periodically purge the economy of obsolescence. Artificially arresting the crises, through budgetary deficits, as is being done today in the US, can only lead to the 'crisis of postponed crisis'. The capitalist world may well attempt solutions to its current crisis which augur ill for the third world.

I

SO much has been happening in the world economy in the 1980s, so many new and totally unpredictable developments have been taking place, that making proper sense of even one of them will take us beyond the scope of a single paper. Who would have thought for instance that in the 1980s the United States, the most powerful capitalist country in the world, would also emerge as the world's largest debtor, thus, superficially at any rate, contradicting Lenin's celebrated theory of imperialism which talked of capital exports from the advanced capitalist nations? Who would have thought that the oil prices which had skyrocketed in the seventies, a fact that many including the Nobel Prize-winning English economist John Hicks held responsible for the end of the long post-war boom, would come down so sharply in the eighties as to obliterate almost the memory of the two oil-shocks? And yet, this collapse of oil prices has not put the world capitalist economy back on the rails where it was in the sixties. On the other side, the slump which had been predicted by many for the eighties has also failed to materialise. Unemployment rates, especially in Europe, continue to be very high, but there is no slump in the advanced capitalist countries. It may yet materialise in the nineties as some believe, but that is another matter. In short, the economic landscape in the 80s has been vastly different from that in the 70s, and also vastly different from what anybody had imagined it would be.

Instead of starting from specific features of this landscape, what I propose to do in this paper is something altogether different. I propose to start from certain general observations about the characteristics of capitalist development, and on the basis of these arrive eventually at some of the specific features of the world capitalist economy in the seventies and the eighties, the continuities as well as the discontinuities between which would, I hope, become somewhat more intelligible on the basis of these general observations. For making these general observations, I turn to the writings of Marx.

Three specific remarks of Marx in this context deserve attention.[1] First, given the anarchic nature of capitalist development, this development occurs not smoothly but in a series of jerks, episodes of furious accumulation in a boom, being followed by episodes of crisis during which not only is there much unemployment but even a good part of the capital accumulated in the boom is destroyed. Secondly, the crisis, involving the destruction of some capital creates the conditions for the next boom. The crisis according to Marx was a forcible resolution of the contradictions of a capitalist economy, i e, was capitalism's own immanent device for transcending, partially at any rate, the contradictions which impede its further advance. And thirdly, this entire process of uneven, jerky and episodic growth is characterised by technological advance, since the process of capital accumulation is ultimately inseparable from technological change and the introduction of new processes and products which, in a given situation, are more profitable from the capitalist's point of view.

These propositions of Marx are well known. Each one of them also figures later in Schumpeter's theory of business cycles where it is incorporated of course, in a theoretical schema with an altogether different ideological and sociological perspective. But whether or not Marx's theory of crisis should be legitimately interpreted as a theory of cyclical fluctuations alone,[2] and I personally think that this would be unfair to Marx's theory, it clearly provides a valuable insight into the dynamics of the capitalist system. Basic to Marx's understanding is his second remark quoted above, namely that capitalist development surges forward only upon the destruction of a part of capital itself. One can then draw a picture of capitalist dynamics as follows: capital accumulation proceeds rapidly in a boom, and together with it a number of new processes and new products are introduced. But precisely because we are in the midst of a boom where demand is increasing rapidly, markets are expanding fast, these new processes and products do not replace old processes and products. The conditions of the boom are such that there is room for both old as well as new processes to co-exist. What is more, the rapid growth of the market means that even while new processes and products are being introduced to an ever-increasing extent, the old processes and products also continue to expand. If however, for some reason, which we shall come to later, the boom comes to an end, the pace of capital accumulation slows down, and together with it the pace of expansion of the market, then it becomes impossible for both old and new processes to co-exist any longer. There is no longer room for both in the market, and a more or less prolonged period of unemployment and capital destruction must result, in which the means of production employed in old processes and products have to be systematically scrapped. Only after the scrapping has gone on for some time that capitalists' interest in speeding up the pace of accumulation will revive once again, and a new boom will be initiated. Much of course happens in this process of struggle between capitals when the boom has come to an end, which has political ramifications, apart from economic ones. This is one reason why to present Marx's crisis theory as merely a theory of business cycles is to give it a mechanical character which it does not have.

There are two questions one can ask for Marx's theory. One, why does the boom come to an end? To this Marx did not give one but several answers, e g, constraints of demand, shortage of raw materials, progressive using up of the reserve army of labour which tends to raise the workers' share, etc. The reason he gave several answers lies, in my view, in the fact that he was more interested in sketching all the contradictions that emerge in a boom, than in outlining a particular theory of business cycles. His concern, as has been often noted, was with the qualitative and relational aspects of capitalism, than with the more specific and quantitative questions of constraints upon capital accumulation in a particular situation. Likewise it is the texture of the crisis that interested him more, as the philosopher Karl Korsch was to note later.[3] Which particular one of the contradictions of a boom acts as the constraint upon it is something which depends upon the specific situation, and Marx, in this context, was not discussing specific situations.

Schumpeter in his theory of business cycles, where he did have a long empirical discussion as well, tried to answer the ques-

tion, but in a manner which is patently unsatisfactory. In his schema 'entrepreneurial' ability, which was responsible for the act of 'innovation' existed only in limited quantities over any given stretch of time, though each 'innovation' had large numbers of imitators. Once a 'cluster' of innovations was used up, the boom came to an end.[4] Postulating that entrepreneurial talent exists only in limited quantities may have suited Schumpeter's own sociological view of capitalism and hence his ideology, but is difficult to accept in conditions, at any rate, of modern capitalism,[5] where, by Schumpeter's own admission, the entrepreneurial role ceases to be person-specific.[6] An idea, mentioned in passing by Schumpeter, but given greater emphasis by Oskar Lange, appears more promising. According to Lange, the very conditions of a boom create money-wage and price-rises because labour and other inputs have to be taken away from their existing uses and put to new uses; this price and wage-rise increases the riskiness of investment and hence brings the boom to an end.[7]

While the argument that inflation acts as a constraint upon the boom, as Lange had recognised, appears altogether plausible, the reason behind this inflation is not so much the absolute shortage of labour and other inputs which have to be diverted from one kind of use to another. Even at the peak of the boom, capitalist economies carry substantial amounts of unemployment and unutilised productive capacity, so that we cannot talk really of any absolute shortages. Rather, we have to see inflation, which a boom engenders and which ultimately brings the boom to an end, as a reflection of accentuating social conflicts of an aggravation of social contradictions on account of a prolonged boom itself.

Let me elaborate upon this. For its smooth functioning, capitalism requires a degree of discipline upon workers as well as on primary producers. The reserve army of labour, as Marx was the first to point out, is a 'disciplining' device for the workers. It not only keeps wage-claims in check, but also forces the workers to work hard by holding over their heads the threat of the 'sack'. In boom conditions, when the employment rate is high, the threat of the 'sack' loses much of its force. Workers feel emboldened to put forward higher wage-claims, and work-discipline itself tends to get undermined.

This last point was emphasised by Michael Kalecki who, in an extremely insightful article in 1943, had predicted that, notwithstanding the possibility of Keynesian demand-management, capitalist economies would never succeed in maintaining full-employment.[8] Kalecki observed that:

> ...the *maintenance* of full employment would cause social and political changes which would give a new impetus to the opposition of business leaders. Indeed, under a regime of permanent full employment, 'the sack' would cease to play its role as a disciplinary measure. The social position of the boss would be undermined and the self-assurance and class-consciousness of the working class would grow. Strikes for wage increases and improvements in conditions of work would create political tension.

These wage increases clearly would not be allowed by the capitalists to impinge upon profits, but would be passed over in the form of higher prices, i e, inflation. Likewise, the maintenance of boom conditions would also embolden primary commodity producers to combine for higher prices.

To be sure, such inflation does not emerge immediately when the level of employment or activity is stepped up. It is the persistence of high levels of employment and activity, i e, the maintenance of prolonged boom conditions, that gradually results in the creation of a situation where the coercive discipline so necessary for sustaining an antagonistic social system like capitalism tends to get undermined. And a reflection of this undermining is inflation. Inflationary pressures thus build up slowly during the boom and exacerbated by happenstances eventually reach proportions where they adversely affect capitalists' inducement to invest, and, force the state to engineer a contraction in economic activity. And this heralds, as we discussed above, the onset of a crisis where unemployment must grow, and much capital must be scrapped.

The second question one can ask in the context of the theory of crisis is: what happens if for various social reasons, which we shall come to later, capital destruction is kept in check? Clearly, this can happen only if room is artificially created not by the pace of capital accumulation itself, but, as I have just said, artificially, which in today's context means a budget deficit. This would mean that the rate of growth of the system would be slower than before, i e, that the boom conditions would distinctly come to an end; but at the same time a serious slump, which is the mechanism of capital destruction, would be artificially averted. The system would be deliberately kept 'hanging in mid-air', as it were, through the stimulus of budget deficit. Such a 'frozen' system has its own contradictions which I shall examine in the next section. But my point here is to emphasise that the world capitalist economy today represents such a 'frozen' system, which is prevented from entering into a slump by the US budget deficit.

II

The post-war years, as is well known, saw one of the most pronounced long booms in the history of capitalism. Contrary to what many radicals had thought, the developed capitalist economies experienced growth rates which were higher perhaps than they had ever been in the past. Between 1960 and 1973 for instance, the OECD countries as a whole had a 5.1 per cent annual growth rate in real GDP, and even the slowest among them, the UK, witnessed a 3.1 per cent growth rate. At the same time, the inflation rate was extremely moderate; over this period it was only around 4.0 per cent per annum. Starting from the mid-sixties, however, inflationary pressures had begun to build up. What is remarkable about it is that prior to the mid-sixties, notwithstanding a decade of high growth, inflationary pressures had been contained. The key to the puzzle lies, in my view, in the fact that even though the terms of trade between primary products and manufactures declined by a third between 1950 and 1972, the price rise in nominal terms was extremely small. In other words, notwithstanding decolonisation, or perhaps because of it when newly independent countries were keen to push out as much of primary commodity exports as possible in order to obtain foreign exchange for industrialisation, advanced capitalist countries could still make use of third world primary producers as a cushion against possible domestic inflation, and thus could maintain an impressive long boom.

In fact it was the domestic working-class which was the first to rebel. The inflation-acceleration all over the capitalist world owing to the 'hotting up' of the Vietnam war in the mid-sixties, combined with the fact that in the earlier boom years the relative share of post-tax wages in GDP had fallen on account of the so-called 'welfare state' measures which meant in effect a transfer from the employed to the unemployed and the poor, brought about a worldwide wage explosion in 1968; the context of the boom, entailing high levels of employment, clearly helped the process. And then in 1972-73 there was an upsurge in primary product prices which was aided, among other things by speculation resulting from the delinking of the dollar from gold, which removed a 'safe' form of holding wealth. While other primary product prices fell back soon enough, oil prices were kept up and pushed up through the two oil shocks. The resulting inflationary explosion forced a contraction in output, as a means of checking inflation.

All this is well known, as is the fact that the inflation rate in the advanced capitalist countries has come down sharply in the eighties and is now just about 4-5 per cent per annum. The limited recovery since 1983, spurred mainly by the US budget deficit, and more pronounced in the US and Japan than in Europe, did not lead to any acceleration in inflation, mainly because the terms of trade for primary commodities now are around the lowest level since the great depression of the 30s; and even the nominal prices of non-fuel primary commodities have declined sharply since 1980s. In short, the third world countries have once again provided the cushion which has been used by the advanced capitalist countries to bring down their rates of inflation to the sixties level.

But the crucial question which arises is the following: if the inflationary upsurge had provided the reason for the collapse of the long boom, now that inflation has subsided why should not the advanced capitalist

countries get back to the boom conditions of the sixties? It is this key question to which I shall devote myself for the rest of the paper. A distinction must be drawn here between the Japanese style state monopoly capitalism on the one hand, and the US-European style state monopoly capitalism on the other. To be sure, the relationship between the state and monopoly capital is not necessarily the same in Europe and the US, or even within Europe itself. Even so, the closeness of the relationship between the state and monopoly capital which exists in Japan is matched nowhere else in the advanced capitalist world. A consequence of this is that the influence of the state upon investment decision-making by the capitalist class is still of a low order in the rest of the advanced capitalist world outside Japan. As Offe rightly remarks, investment decisions in western capitalism are still largely dependent upon the perceptions of the capitalists themselves.[9] This being so, the resumption of boom conditions depends upon the outlook of the capitalists in Europe and the US, the extent to which they are prepared to step up investment; it cannot be engineered through mere state intervention which can at best achieve a high level of activity through its own expenditures financed in a large measure by budget deficits, but cannot ensure that the composition of aggregate demand shifts in favour of investment.

Herein, however, lies a contradiction which can best be understood by recalling Marx's second remark mentioned in the previous section. One of the consequences of the long post-war boom was that in a large number of spheres, Japan forged technologically ahead of the US. And in others, even where there was no significant technological superiority of Japanese commodities, the comparatively low Japanese wage levels made her commodities more competitive. This is not to say that the US does not possess or employ the most advanced technologies available in the capitalist world; what is being said is that 'the technological spread' within the US production structure is wider than in the case of Japan. Consequently, a crisis leading to a 'free-for-all' and capital destruction would have a disproportionately heavy impact upon US industry compared to Japanese industry. The US budget deficit, which sustains demand in the US and thus prevents a crisis, has the effect simultaneously therefore of sustaining an industrial production-structure that has grown increasingly uncompetitive and in certain areas technologically obsolete. The artificial stimulus provided by the US budget deficit to the US economy, while preventing a crisis in the short run, dooms this economy to uncompetitiveness and obsolescence. The US therefore is caught in a 'crisis arising out of the prevention of a crisis'.

This is not a new situation in the history of capitalism. Around the turn of the century, Britain which was then the leading industrial power in the capitalist world, was in an exactly similar predicament *vis-a-vis* the new industrialisers of that period such as Germany and the US, a fact to which W Arthur Lewis drew attention in his *Economic Survey 1919-1939*.[10] Like the US today, Britain then ran a continuous merchandise trade deficit, but she managed to balance the payments and even made capital exports because of three factors: a huge trade-in-service income, from shipping, insurance, etc; a large magnitude of interest earnings from previous capital exports, which even after paying for substantial fresh capital exports, had something left over to meet the trade balance; and finally, the existence of colonies where British goods could be sold at the expense of local 'deindustrialisation' which kept the trade balance itself in check, and from where a 'drain' in the form of 'home charges' and remittances could be obtained. Had these factors not operated, Britain would have had to abandon free trade much earlier and the entire capitalist world would have faced a recession much earlier; in other words, the long boom of the pre-first world war years would have been truncated sooner.

The possible courses of action before the US today can be the following:

First, allow things to continue as they are. The problem here however is that the US is meeting her trade deficit not through 'home charges' or investment-income earnings, but by borrowing massively from abroad. Even though, the spectre of the most powerful capitalist country being the largest borrower is an entirely novel one, whose consequences cannot be anticipated, clearly such borrowing does make her economy highly vulnerable to external shocks and further worsens the prospects of restructuring.

Secondly, it may, like Britain earlier, try to use trade in services as a means of offsetting the merchandise trade deficit. This particular consideration perhaps lies behind the insistent demand by the US before the GATT for a 'liberalisation' by the third world countries of trade in services, a demand that has so far been strenuously objected to by countries like India and Brazil. In any case, it is no longer clear, as it perhaps was a decade ago, that a liberalisation of trade in services would benefit the US rather than Japan. On a par with this is the US demand for greater access of her agricultural goods to foreign markets, an issue on which she has clashed sharply with the EEC.

Thirdly, it could try and push more of exports of goods into the developing country markets. Just as Britain had resorted to a 'flight to colonies' in the matter of exporting, the US too could increasingly seek refuge for her industrial products in developing country markets. But the developing countries have no purchasing power to pay for such exports. An increase in such exports therefore would have to be financed by capital exports. If instead of US exports to developing country markets increasing, Japanese exports to such markets increased, then that too would serve the purpose from the US point of view. In other words, Japanese goods being diverted from the US market to third world markets would bring down the US payments deficit. By the same token however capital exports have to be made to third world countries to accommodate such larger exports of commodities to them. But the agencies which can make such capital exports are the multinational banks and they do not find these countries creditworthy enough to make larger capital exports to them. Some plans such as the Okita plan have been evolved which would allow larger capital exports to third world countries through the courtesy of the Japanese government. But the scale of such operations is bound to remain limited in the absence of far greater political leverage *vis-a-vis* such countries.

Fourthly, if Japan reflated her economy, i e, absorbed more of her goods at home, then that would improve the US payments position. But Japanese reflation cannot take the form of a larger home consumption since that would require larger wages in Japan, and capitalists do not voluntarily reduce capital exports for the sake of improving the consumption of workers at home. It cannot even take the form of a larger Japanese domestic investment since Japan has a very low unemployment rate, and larger investment would result in part at any rate in larger unutilised capacity owing to labour shortage; no capitalist group would agree to reduce capital exports in order to set up factories at home which cannot be run because of labour shortage. The other possibility is an increased Japanese military expenditure. This has been happening in any case, and the US until now has been favourably disposed towards this possibility because of economic reasons. But a militarily strong Japan is a spectre that the US itself would certainly not like to see.

Fifthly, there is the classical text-book remedy of a depreciation of the dollar. This has happened; the dollar was until recently on a significant downward slide, but the impact of the devaluation on the magnitude of the US current account deficit appears to have been altogether negligible, confounding all the orthodox neo-classical economists.

Sixthly, the US, could in fact just go through with a domestic recession. It could cut the budget deficit, reduce domestic aggregate demand, which would both curtail the payments deficit as well as force capital destruction and larger unemployment domestically. But the prospects of this policy being pursued would be greater if at the margin the demand cut had a greater impact upon imports than upon domestic output. Such however does not appear to be the case. To cure the payments deficit therefore the recession would have to be very deep, apart from the fact that it would afflict the entire capitalist world and not just the US. This would be a major political set-back to the stability and credibility of the capitalist system.

Seventhly, the US could attempt to move towards Japanese style state monopoly capitalism. It could induce capitalists to restructure their production to undertake investment in new processes, etc. In a sense both in the US and in Europe there is a strong body of opinion advocating such a fundamental shift in the structure of western capitalism in order to meet Japanese competition. But, such shifts cannot be made to order. It is conditional upon the development of appropriate class configurations whose emergence is not dictated from above but is rooted in the societal reality.

And finally, as is being demanded by a large body of US opinion, she could go in for protectionism. The presumption behind such a demand is that it would curtail the US payments deficit without engendering a domestic recession. If any thing it would create a recession among the US trade rivals like Japan. But it is difficult to imagine that they would just sit back and quietly allow the US to impose a recession upon them, without taking any retaliatory action. In other words, any move towards US protectionism will necessarily plunge the capitalist world into fierce economic rivalry, and as in the inter-war period precipitate an all-round recession through a shrinking of world trade.

Thus, no matter which way we look at it, there seem to be no easy solutions to the current economic problems of the capitalist world. The newly-elected president of the US, George Bush, has already promised that domestic taxes are not going to be raised, which means that the budget deficit and the associated payments deficit are likely to continue. But as we have seen, allowing things to drift only postpones the day of reckoning, makes the problem of restructuring that much more difficult on account of having been postponed, and increases the vulnerability of the system. We are witnessing in short a remarkable phenomenon; the advanced capitalist world is in the midst of a peculiar 'crisis of postponed crisis'. This has implications for us all, because unless we are vigilant, some of the 'solutions' mentioned above, namely of overcoming this predicament by exporting recession to the third world countries, and inducing multinational banks to finance such exports by acquiring greater political leverage *vis-a-vis* such countries could well be tried out.

5 Nicholas Kalder expressed his scepticism of Schumpeter's theory of business cycles in the following words: '...the necessary bunching (in time) of innovating investment, which is essential to Schumpeter's theory, cannot be satisfactorily explained without bringing the Keynesian multiplier, and some variant of the output-investment relationship to one's aid'. See his 'Economic Growth and Cyclical Fluctuations' in the *Economic Journal*, March 1954, reprinted in *Essays on Economic Stability and Growth* (Duckworth, 1963), where the quotation appears on p 214.

6 This is discussed by Schumpeter in his 'Instability of Capitalism', *Economic Journal*, 1928, and also in *The Theory of Economic Development*.

7 Oskar Lange, review of Schumpeter's *Business Cycles* in the *Review of Economic Statistics*, 1941; this idea which also appeared in an earlier work by Fritz Machlup (quoted in a footnote in Schumpeter's *Business Cycles* and in Schumpeter's opus as well, sat rather uncomfortably in Schumpter's own theory: since the entrepreneur was not a risk taken according to him, any increase in the riskiness of investment would adversely affect *not* his inducement to invest, but at the best the cost of credit to him. If we follow this track, and still remain within the Schumpterian scheme, we can at best therefore say that the boom comes to an end because of a rise in the cost of credit, which is empirically quite unconvincing, and which is why Schumpeter never followed entirely this track, but kept coming back to the 'limited-entrepreneurial-ability' idea, that was also more in keeping with his 'vision'. Once we step outside the Schumpeterian scheme, however, the Lange idea becomes a powerful one.

Britain, USA and Indian Gold Standard

G Balachandran

The controversy that surrounded the currency question in colonial India is the focus of the present paper. Re ing on primary sources, the paper argues that the preservation of the gold exchange standard and the rejecti of the plea for a gold standard, made by the government of India and Indian nationalists alike, had much do with British and American interests, a crucial determinant being Britain's external liquidity crisis in the inte war years.

THE British Indian gold standard has been a topic of some controversy both among contemporaries and among latter-day scholars. Indian nationalist opinion generally supposed that India was denied the benefits of a full-fledged gold standard as a means of reducing her access to gold. Capitalising on the mercantilist flavour of this criticism, official opinion propagated the latter as a cost-effective variant of the gold standard. For example, Keynes, while acknowledging the role of the British Treasury in thwarting the establishment of a gold mint in India over 1897-99 and elsewhere admitting that official Indian sterling reserves eased the London money-market characterised the Indian gold-exchange standard as the system of the future.[1]

Among modern scholars, Marcello de Cecco has argued that an Indian gold standard at the very least would have accentuated the seasonality of the London money market when the latter was faced with the autumnal American drains. More generally, he has suggested that the Bank of England's ability to stabilise the gold market and control discount rates in London, with the relatively meagre gold reserves at its disposal, depended on how far the British authorities could reduce the monetary demand for gold from important countries on the periphery such as India by switching the latter's asset preferences to sterling.[2]

However, B R Tomlinson has tried to argue that the gold-exchange standard was promoted on account of its intrinsic merits. He has suggested that Britain's actual or feared liquidity crisis played no part in the establishment of the system. Referring to the rejection of official and non-official Indian proposals for a gold standard in 1926 by the Hilton-Young Commission, he claims that the intervention of British interests, notably the British Treasury, had little significance for the final outcome.[3]

While this is the state of the debate today, we hope to show through a detailed reference to the primary sources in London that the views and actions of the British Treasury, including their mobilisation of crucial American interests inimical to an Indian gold standard, were central to the Hilton-Young Commission's final recommendations. It is also quite clear that Britain's severe external liquidity crisis determined this decision and as such, should shed some light on earlier gold standard controversies. The paper that follows is a spin-off from a larger work on the deflationary impact on the Indian economy of the inter-war international liquidity crisis.

I
Background

As has been discussed in a recent thesis, since the first world war, in various degrees, Indian monetary policies (including exchange-rate policies) were formulated to take into account Britain's severe external liquidity crisis.[4] This crisis took the form of a current account deficit in some years and in other years of surpluses that were smaller than the size of her capital exports. The resulting deflationary bias in the Indian economy together with the failure of the 1920 stabilisation effort which was almost directly influenced by the British crisis led to renewed demands for a gold standard for India which influential sections of Indian opinion supposed would give her some degree of monetary autonomy.[5] This clamour acquired fresh relevance as the Indian government endorsed the idea in the proposals that it made to the Hilton-Young Commission.

Unfortunately for this section of Indian opinion, an Indian gold standard in the 1920s was nothing less than a nightmarish prospect for the British policy-makers. Even in the relatively relaxed pre-1914 years, Britain, fearing the effects on the gold market and the London money market, had been determined to prevent its establishment in India. India's non-monetary gold imports were a source of some worry in London but the problem was seen as a long-term one best tackled through the promotion of banking institutions and a domestic market for financial assets. In the changed 1920s, faced with current account problems. Britain had been hoping to increase her gold exports to the US both to boost her dollar earnings as well as induce the Americans to trigger global expansion. Together, they would mitigate the domestic deflationary effects of Britain's adjustment to her external disequilibrium.

Therefore, one of the main preoccupations of British Indian monetary policy in the inter-war years was to reduce Indian private gold absorption which in a good year was capable of draining some 25 per cent to 30 per cent of the world's gold output. In this environment, British policy-makers could hardly be expected to indulge the Indian demand for a gold standard with an actively circulating gold currency. In fighting the Indian gold standard, Britain secured active support from the American Treasury and the New York Federal Reserve. The Americans in general opposed Britain's efforts to promote the gold exchange standard on a world-wide basis because the not experience the short-term gold shor problem that formed the motive behinc British proposal. However, they suppo the official British view that India sh continue to have a gold exchange stand so as not to damage the interests of s producers in the US and so that Europ stabilisation which had partly been fina by the Americans would not be hinde The congruence of American and Bri positions in regard to the Indian gold s dard even as they differed so fundament on the basic issues relating to the inter- trade and monetary system provides insi into the extent to which in financial relat with countries on the periphery, power the centre often had broadly similar inter

In the background of Britain's liqui concerns in the 1920s, the Indian gove ment's gold standard proposals came bolt from the blue.[6] The proposals w unexpected also because, ever since Chamberlain Commission reported in 19 it was thought that the proponents of a g standard for India had been marginalis In the Babbington-Smith Commit (1919-20), the government of India repres tative, M M S Gubbay, the Indian mem D M Dalal and a few witnesses includin former finance member of the governm of India favoured a gold standard with f bodied gold coins in circulation. Desp objections, this committee was forced by prevalent conditions of the world si market and the threat of rupee inconv tibility to recommend a fall-back gold st dard and gold coin for India. But scheme's implementation was postpo indefinitely and in the months that follow the report, it became inoperable.[7]

Ever since, the gold standard scheme h been propagated ony by nationalist opini It therefore came as a surprise to everyo in London that the government of India h fired the first salvoes in what might h been expected to be a minor controve marked by a gold standard 'fatigue'. It w all the more surprising that an active p ponent of the scheme was Basil Black finance member of the government of Ind who, until then, had had impeccable a gold standard credentials—having activ opposed the Indian gold standard in 1 and initiated the Genoa proposals economising monetary gold.[8] The cons nation that the Indian gold standa proposals—and Blackett's association w them—caused in London is a rich source material on the subject.

Why did Blackett favour a gold standa

d gold currency for India? It cannot be at Blackett's day-to-day experience with ancial problems on the periphery blinded m to the realities and concerns of the cen- . His stint in India only seemed to have arpened his insight into Britain's financial oblems. For instance, in a letter to enjamin Strong who was the governor of e New York Federal Reserve, Blackett saw early that Britain's ability to retain finan- al leadership of the empire and of the orld in general would depend on whether e made the necessary domestic economic ljustments.[9] Therefore, Blackett must ve had a powerful reason to support the dian gold standard proposal, despite fears at its acceptance would accentuate the dif- culties of adjustment to the very conditions at he had diagnosed in his letter to Strong.

Blackett's arguments in support of a gold rrency may therefore be briefly sum- arised. In the same letter to Strong, he gued that the rest of the world was not "... ending less gold to India by rejecting my an. On the contrary you increase the strain the end." He said both Montagu Norman overnor of the Bank of England) and trong knew that they held gold reserves in ccess of what they required but would not cknowledge it. They could both do more educate the public at home to manage ith less gold, while he had to give the dians gold before they could realise that ey did not need it.

Confessing to Niemeyer that he arrived at e gold standard idea "rather to my surprise nd somewhat against my will", Blackett aintained that the threat from India to the old standard countries could not be fully liminated.[10] But, he and Denning argued, eir proposals would, if adopted, lead to quicker acceptance of notes and a lower emand for gold in India in the long run.[11] lthough "wasteful and expensive", India ad to pass through the "intermediate stage" epresented by a gold currency before arriv- ng at the ideal of an externally convertible aper currency. Gold circulation would "inspire confidence and... provide the timulus... for (the) investment and the anking habit."[12] Lastly, a gold standard vould liberate the rupee from the mercies f silver.

Blackett's views in support of a gold stan- lard in India accorded closely with 'na- ionalist' opinion. On the Babbington-Smith Committee, D M Dalal, and among the wit- esses who appeared before it, Manusubedar, V Thackeray and B F Madan, represented his tendency. In 1926, Purushottamdas Thakurdas and his small group of advisers laimed this mantle. It is hard to prove the iew held by the India Office that these na- ionalists were consumed by a gold fetish. t has been recognised that the nationalist lemand for a gold standard reflected the contemporary desire for an automatically egulating currency system that was con- idered invulnerable to political mani- pulation.[13] But the concern of the 'na- ionalist' business interests at India's own appetite for non-monetary gold has passed without comment.

In 1919, many Indian witnesses and Dalal himself in his minority report, blamed London for choosing to liquidate India's war-time surpluses in the form of silver rather than gold or gold-backed securities. The model of an Indian economy they seemed to have in mind was that of an open economy in which gold or security flows balanced India's external accounts, much as they did at the centre. They saw the transfer of the gold standard reserve to India as providing the basis for the working of the above model. It would also assist the emergence of a banking system which was capable of mobilising India's potentially huge savings and managing the liquidity position of the domestic economy in a way as not to impose a brake on trade and business activity.

The Bombay industrialists including Thakurdas were not happy with India's large gold imports in the two years preceding the setting up of the Hilton-Young Commission.[14] Thakurdas agreed with Pherozeshah Dalal that the unprecedented gold imports affected consumption of cotton piece-goods, both foreign and indigenous, and diverted funds away from productive investment. He blamed the currency policy of the government for causing increased gold imports and hoarding, as no importer would sell his gold to the mint at the 2s statutory rate.[15] He also argued that large non-monetary gold imports made monetary conditions tighter rather than easier. The Bombay Mill Owners Association passed a resolution to the same effect.[16]

Thakurdas believed that gold hoarding had begun with the demonetisation of the gold rupee over 1830-1835 and a remonetisation would bring gold out of the hoards. But Henry Strakosch, his colleague on the Hilton-Young Commission, an early protagonist of the gold-shortage school in London and the staunchest opponent of the Indian gold standard, disagreed. He suggested to Joseph Kitchin—a gold dealer who appeared before the commission—that if gold came out of hoards to circulate as money, they would only replace other forms of currency and not alter the overall picture on metallic flows. Kitchin agreed.[17]

It is easy to see that Strakosch's arguments, as it was convenient to him, assumed the worst. The liquidation of Indian gold hoards would have had the same effect as the liquidation of any other non-monetary asset. The proceeds of the liquidation would be invested in more liquid assets and gold so released would be a net addition to the world's monetary gold reserves. At the very least, if gold came out of hoards to circulate as money, they would replace a portion of India's monetary gold imports, over which such fears existed in Europe.

The India Office did not believe that a gold standard would reduce Indian gold demand in the long run, let alone that it would increase world gold availability. On the contrary, it was feared that it would only worsen the problem. Opinion in London was also convinced that, in estimating India's future demand for gold under a gold standard, the possible liquidation of her private hoards need not be taken into account.

II

Mobilisation

Hence, the India Office and the Treasury were not inclined to take the threat contained in the Indian proposals lightly. Soon after reaching Bombay, E Hilton-Young alerted prime minister Baldwin to the effects on London of the gold standard scheme. He wrote that Blackett had thrown a "prodigious brick into the peaceful waters of official orthodoxy" by siding with the "nationalist demand" of a gold currency. He added, "(you) will see, ...that it is not without its possible reactions upon our own situation at home."[18]

At the India Office, Cecil Kisch, a finance department official wrote that the scheme did not take into account "disturbances" that would be caused to "interests the world over".[19] The India Office also began mobilising London opinion. In a letter to Otto Niemeyer in the Treasury, Kisch referred to the gold standard memorandum and said, "in view of the important bearing that the scheme has on the position and prospects of gold and sterling", the gold standard papers were being sent to him for his "private information". The papers also included Kisch's own notes on the subject, argued, as he emphasised self-consciously, from "the point of view of the interests of India." He assured the Treasury official that upon its return, the currency commission would take evidence from the India Office and "other representatives of opinion in London."[20]

Meanwhile Blackett had been in touch with Niemeyer. Niemeyer's first response was to note on Blackett's letter that "Simla (had) got hydrophobia from Bombay."[21] In his reply, he said that the scheme filled him with "pity and fear". He did not see any advantage to India to bear 100 million pounds of "America's burden, at the cost of disturbing the currencies of most of the civilised world (including continental countries now stabilising...) and also annihilating the silver market." It was bound to endanger the gold standard, indeed "to end (it) altogether." He expected "very strong opposition from all financial circles in this country at least". A gold standard and a gold coin would not change the "immemorial habits of the East on savings and investment", Niemeyer said, and hoped that Blackett would have difficulty in convincing Strakosch and the other members.[22] On receiving this letter, Blackett complained about its tone to Strakosch, who relayed the complaint to Niemeyer. In a draft of a letter that was probably not sent, Niemeyer reiterated his disagreement with Blackett's "volte-face to gold in circulation" and said he failed to understand Blackett's

resentment. "You must not forget, sitting in Simla, that I have politicians too."[23]

One of the more important politicians in question was Winston Churchill, Niemeyer's chancellor of the exchequer. About this time, attacks directed against the costs of the lines of credit (involving the Bank of England, the New York Federal Reserve, the Treasury and the Morgans) established to assist the sterling's return to the gold standard, resumed in the press and the House of Commons. Stung by the criticisms, Churchill, always a reluctant advocate of the restoration, asked Niemeyer if it was necessary to persist with the Treasury's arrangements with the Morgans. "Pray... do not let us drift into paying unnecessary fees", he noted.[24] Niemeyer replied that it was too early to terminate the line of credit. A "disturbing element which is at present unknown to us, will be the report of the Commission now sitting on Indian currency. If their report involved a considerable withdrawal of gold, it would be imprudent to deprive ourselves of any existing protection." Other uncertainties were the overseas lending position (which the Treasury was keen to regulate) and coal.[25]

Perhaps as Niemeyer expected, Churchill was moved by the above note to action. "Tell me more about the Commission on Indian currency", he minuted, "...I did not understand that any danger would come from this quarter. It would be important to discuss any evil development with Lord Birkenhead (the secretary of state for India—GB) at an early stage." Niemeyer replied that if the gold standard proposals were accepted, India might try to take gold from London. "I don't think the commission will support the scheme: and the India Office are opposed to it and well aware of the difficulties. I think overt action by us... would be unjudicious *vis-a-vis* Indian opinion." Churchill agreed there was no question of overt action but "only of guiding events at an early stage by private representation." He sought a short note on "what we do not want to happen and why".[26]

Niemeyer's note was along the expected lines. After briefly speaking of "Indian interests", he went on to discuss the question from a more general point of view. He said a gold loan necessitated by the Indian gold standard scheme would be "unwelcome" to Britain. The appreciation of gold that might result would have serious repercussions on the "gold currency systems of the world, in particular our own...". The proposal to sell silver would upset the silver countries and lead to an increase in the prices of lead and copper "which most of Europe has to import from America". He continued, "I believe the Currency Committee (*sic*) are fully aware of the dangers of the Indian scheme, and will, in fact, fight them in their recommendations..." but, "their task has not been made easy by the mobilisation of Indian opinion and the forthcoming attitude of official representatives in India". Niemeyer enclosed a draft letter to the secretary of state for India which warned him of the consequences of the Indian scheme though the reasons in this letter were couched in Indian terms.[27]

In his reply, Birkenhead said the gold currency proposal would not be accepted lightheartedly "even if it were supported by the Royal Commission" and suggested that the Treasury send a witness to put its case. "... I am quite ready if you wish to suggest privately to Hilton-Young that this should be done."[28]

On the suggestion that a Treasury official appear before the commission, Niemeyer's note bears detailed quotation. "I had already discussed this with Hilton-Young and... both of us thought it undesirable for Treasury to give evidence. We don't want the rejection of Indian ideas to be attributed to the British Treasury as this may raise real trouble in India." The commission would hear the governor of the Bank of England and others "who will be quite sufficient. I think it would be bad tactics for the Treasury to assume, at this stage, the burden of direct opposition and much better to keep ourselves in reserve... I am... in close personal touch with several members... and I believe we can be more effective in this way than by a frontal attack—at any rate until we are forced (which I don't think we shall be) ... into such an operation." Churchill scribbled Yes" on the note.[29]

It was not only opinion in London that was being mobilised to defeat the Indian government scheme. Across the Atlantic, Benjamin Strong found Montagu Norman "appealing" to him "for help to defeat the... proposal". Initially reluctant to intervene in, what he saw as, a "semi-political question between Great Britain and one of her dominions (*sic*)", the "worldwide concern" that the matter aroused, however, finally persuaded Strong—according to his biographer—to respond to Norman's plea. Strong was also encouraged by Andrew Mellon, the US treasury secretary to meet the Hilton-Young Commission and convey American opposition.[30]

Meanwhile, consultations were going on within the Bank of England. Officials at the Bank were also talking to important members of the commission and to officials at the India Office. For example, Charles Addis, director of the Bank of England, member of an earlier Indian currency committee and on this occasion, together with Montagu Norman, the Bank of England spokesman before the commission, noted in his diary that he and Norman met with Strakosch at his house "and had a great powwow on gold for India for 2 hours".[31]

With the interests opposing a gold standard in India mobilising in concert, the outcome of the commission's deliberations on this question was probably in the nature of a foregone conclusion.[32] Nevertheless a brief survey—even as we avoid rehearsing all the individual arguments—is in order.

III

Arguments

Gold

The main objections to the gold standar proposals centred around two points: th increased Indian gold demands that migh arise and secondly, the effects on the silve markets of a possible reduction in India holdings of the metal (both official an private), were the gold standard proposa to be implemented. They were linked in tha larger the silver released from monetary ci culation and hoards, *ceteris paribus*, great the gold that would be required to replac them and (assuming that gold dishoardin in India was not promoted by the monetisa tion of gold) lower the price of silver in rela tion to that of gold, and greater the size o the gold loan that may be required to launc a gold standard in India. The designers o the government of India scheme estimate that in order to have an effective gold stan dard in place, India's gold requirement would be of the order of 103 millio pounds.[33] They realised that a gold deman of this magnitude might upset the world' markets. Only the crucial nature of the pro posals, from the Indian point of view justified the risk. The deflationary risks o the proposal and the threat it posed to th gold standard elsewhere could be averted b a careful management of the transaction an collaboration between the government i Delhi with British and US governments (a the 1918-19 silver transfers had been managed) and between the London and New York money markets.[34] The Indian government also hoped to tap the gold sterilised by the US Treasury and the America Federal Reserve System.[35]

Treasury and London opinion generally were much less sanguine although there was no unanimity here. Hawtrey drew up a memorandum for the Treasury on the relationship between Germany going on gold in 1871 and the Great Depression that followed. "Germany at a stroke decided to substitute a large quantity of gold for silver... The shock was too great... for the bi-metallic countries ...and the stampede to gold that followed brought about the fall in the world price level and the collapse of the silver market."[36] In another memorandum, Hawtrey said that if India demanded more gold than the "enormous" amounts she already imported, "there will be nothing left for the rest of the world out of new production from the mines for years to come." India, he said, could force the world to relive the experience of fifty years previously. He also drew attention to the effects on silver of India's off-loading of the metal. Finally, Hawtrey warned of the threat of increased bank rates in London, should India have her way. The demands from India for gold will fall "in the first instance on London" because India would liquidate her sterling reserves to buy gold and her gold demands "can only be met from American gold

erves insofar as England can draw on se later."[37]

The Bank of England witnesses to the ton-Young Commission, Montagu Norman d Charles Addis, echoed these reserva- ns. A few months previously, Norman had ed supposedly excessive gold imports by dia as a reason for not lowering the bank e despite an influx of gold and a fall in ces.[38] He had earlier given up hopes for ld circulation in Britain because of the reats posed by "such unknown quantities India and Russia". In order to hasten itain's return to gold, he wanted her to ablish a "gold bullion standard" in which ld was available only in large units to set- international imbalances.[39] The gover- r and Addis reiterated that if India went gold, European stabilisation, which s already delayed, would be seriously ndered. Some gold backing was necessary strengthen their credit structure, but ready the bulk of the surplus gold was ing to India. If India demanded more ld, interest rates and costs of production ould increase. The volume of international ade would be restricted and the real burden foreign indebtedness increased.[40] The ank of England, they said, would be parti- larly affected. Its reserve position would e eroded, necessitating a rise in the bank te.[41] For these reasons, Norman and ddis added, it would be extremely difficult r India to raise loans for the scheme.[42]

The sizeable American banking represen- tion was also unequivocal in opposition. eorge Roberts, a vice-president of the ational City Bank of New York said that gold standard for India would retard the storation of the gold standard elsewhere. e argued that Indian gold demands already osed the greatest threat to the gold stan- ard, though he added in the same breath at America did not possess any more gold an she needed to back her currency. The ew York Federal Reserve delegation also xpressed opposition to the Indian scheme. n his statement, Benjamin Strong said the ndian monetary programme was a 'vital' merican concern. Apart from domestic nterests, it also affected the US's inter- ational monetary relations and her role in heir reconstruction. An Indian gold stan- ard would be an 'unsustainable' burden on he reserves of the central banks.[43] Hollander who was a member of the Strong elegation also drew parallels with Germany's doption of the gold standard in the 1870s nd said the Indian plan would, besides dis- upting monetary restoration everywhere, ead to "higher interest rates, business distur- ances and economic depression."[44] The American delegation suggested that India dopt a gold exchange standard operating not only through London and the sterling ut also through New York and the ollar.[45]

SILVER

An associated question was the conse- quences of an Indian gold standard for the silver market. The parallels were again historical. As the European continent left silver for gold in the 1870s, silver prices began to fall. This hastened the movement by other countries towards gold. Although India too left silver in 1893, its currency system was not immune to the vagaries of the silver market because of the prevalence of token silver rupees and the guaranteed convertibility into them, of paper notes. As we have seen, this was one justification for Blackett's gold standard scheme.[46]

Although the consequences for the rupee of disturbances in the silver market were bound to be severe, the effects of an Indian gold standard on the silver market were not to be dismissed lightly. The impact on silver currencies of large Indian sales, notably the effect on China, was feared. Kisch raised the spectre of lower Chinese imports and possible political problems with China.[47] Charles Addis said that Britain's trade with China was currently 'small' but it was the 'one great market' left for the expansion of British industry. An Indian gold standard would damage the development of this market, he claimed.[48] It was also feared that if China was forced to go on gold through the bandwagon effect (as it was said to have driven the US in the last century), the upset for the gold countries could be even greater.[49]

According to a report submitted by Benjamin Strong's delegation, if India went on gold, silver prices would fall by half and India would find it difficult to sell her silver at a price high enough to buy sufficient quantities of gold. Indian silver-holders would lose and the silver mining industry in the US, Mexico and Canada would earn 'greatly reduced' profits. Copper and lead prices would increase greatly.[50]

Much of the rest of the evidence echoed these projections. Norman and Addis talked of silver being 'dethroned'. Given the US interest in silver, there was a political problem as well. Silver had a "large... political backing" there and any controversy might make borrowing in the US difficult. Even raising a loan in London, Norman said, in an interesting public admission of London's dependence on US goodwill to stay on the gold standard without further deflation, will raise tricky problems between "us here and our friends in America" and perhaps, even between the two governments.[51]

It is easy to understand the American interest in protecting the value of silver. It is much less easy to understand Britain's motives in defending silver at this time, especially in the light of her actions in the 1930s which were aimed at keeping silver prices low, unless we postulate that the main British concern was not the silver market *per se* but the effects on the market for gold, her own gold standard and the American willingness to lend abroad.

The silver issue was a tricky one even without Britain's interests coming into conflict with those of the US or of India. As Keynes admitted, India's experiences with silver had been 'unfortunate'. The metal had 'few natural supports' and regardless of any Indian move, its position was 'precarious'.[52] India was, in effect, in the position of a large holder of an inferior security. She could not hold it without suffering large capital losses, nor could she hope to sell, except very gradually as the market allowed and even then, sustain heavy losses.[53] There were doubts also about the actual size of Indian silver sales and her gold demands. While the Denning memorandum estimated a 103 million pounds gold requirement, the India Office estimated that India would off-load 700 million ounces of silver. The exchange bankers, including one who sat on the commission, thought this to be an over-estimate. W Preston suggested that with a silver rupee circulation of Rs 2,500 million and a per capita silver rupee requirement of Rs 6, only Rs 800 million was left to be sold in the market or converted into gold. Of this Rs 400 million was needed as a 'fair reserve' for the government of India, while the remainder would be accounted for in about five years by an annual estimated rupee absorption of Rs 90 million.[54] On a similar basis, B F Madan, who informally advised Thakurdas on currency matters, disputed the

need to sell silver and the "absurd proposal for a gold loan".[55] The worst case assumptions projected by the India office also did not consider that, as silver prices fell in relation to that of gold, the Indian asset-holder would have been tempted to move out of gold and into silver (as he had moved traditionally between the two metals and as he was to do in the 1930s), thereby retarding the tendency for silver prices to fall.

The Hilton-Young Commission proceeded to assume the worst and turned down the gold standard demand because it would be ruinous for silver.[56] However the expressed concern for silver was not sufficient to prevent the commission from recommending a 'gold bullion standard' in which the silver rupee would be de-monetised and silver reserves phased out.[57] Between 1927 and 1930, 90 million ounces of silver were sold by the government of India from its reserves.[58] This among other factors led to a steep fall in silver prices whose stabilisation Britain had advanced as a reason to oppose the Indian gold standard. American pleas to Britain to co-operate to steady silver prices in the depression fell on deaf years. The India Office, under advice from the Treasury refused to accept any responsibility for the decline in silver prices and said that the contrary view came from "interested American quarters".[59] The India Office therefore suggested continued sales of silver by India.

IV

Silver in the Depression—A Brief Detour

The silver question was one in which—at least in 1931—Indian interests were ranged against British interests. Regardless of who was to blame for the fall in silver, it would have been in the interests of the US and India to see that silver prices rose. Left to themselves, the two countries would not have been unable to arrive at a silver marketing agreement.

But Britain's chief concern in the financial sphere was related to the distribution of gold, and here also, the US was a major player. The British aim, till 1933, was to use the American silver predicament to persuade her to discuss measures to alleviate the mal-distribution of gold, which Britain felt lay at the heart of her troubles. For the Treasury itself, it was an almost costless tactic but it imposed losses on Indian silver holders and the Indian government.

Through 1930, the Americans had been proposing an international conference on silver stabilisation. The official British response was unenthusiastic. In public, it proclaimed that the fall in silver prices was part of the general fall in commodity prices the world over, and that the latter needed to be solved before prices could rise. Since commodity prices had fallen, in the official British view, as a result of the liquidity crisis caused by the mal-distribution of gold, the latter had to be on top of the agenda of any international conference.[60] The Treasury was willing to summon a conference on gold distribution, but the willingness foundered on American opposition.[61] In other words, until the Americans took steps to help Britain in tackling the gold problem, she was willing to use the USA's silver problem to her own advantage.

To this end, she was keen to prevent the US proposal for a silver conference from making any headway. The Treasury draft of an India Office telegram to New Delhi said that participating in a conference devoted only to silver would be a tactical error. Silver, the draft said, should be used to force the US to discuss other issues that underlay the depression.[62] The India Office and the City also opposed official government of India proposals (and unofficial ones from American bankers) for a silver stabilisation loan from the US.[63]

The Treasury was acutely sensitive to Britain's vulnerability on silver, since it would have been quite easy for the interested parties to arrive at an agreement, and she herself would have no direct influence on the outcome. Therefore, it took great care to prevent even unofficial endorsement of the American silver conference proposal in Britain. It was particularly nervous that Manchester, which had been affected by the slump in the Chinese market, might support the American ideas on silver.[64]

In contrast to the tears that it shed for Indian silver-holders in 1925-26, only four years later, the British government was determined to prevent silver prices from rising. Apart from thwarting American moves to jointly stabilise silver prices, London was also determined to reduce the use of silver in currency wherever possible. For example, when Germany wanted to buy between 16 and 40 million ounces of silver for subsidiary coinage, the Treasury tried to persuade the Germans to increase their note circulation rather than the circulation of silver coins.[65] Further, when China began to face a currency crisis because her silver coins were being melted down and smuggled abroad to take advantage of the higher prices for silver outside China that resulted from the American silver stabilisation programme of 1934, there was a proposal to export Indian silver to China to ease the crisis. But Britain hoped the Chinese problem would become acute enough to compel her to leave silver. With world silver supplies increasing as the metal became demonetised in China, the American stabilisation scheme would have become inordinately expensive. The growth of political opposition to the scheme within the US, it was hoped, would lead to its abandonment. Silver prices would have crashed and out of this turmoil, Britain hoped to retrieve the gain of forcing the Americans to the negotiating table to discuss gold distribution and perhaps, persuading China to peg to sterling. To realise this scenario, the British government refused to allow Indian silver to be exported to China.[66] Even while betraying indifference to the price of silver and Indian interests in the metal, the Treasury was not above trying to make a profit out of India's surplus stocks of silver. It persuaded the Americans to accept silver in settlement of a war debt instalment. Britain bought silver from India at about 21d per ounce but valued the silver at 27d while settling the US debt.[67] During the first world war India was forced to take silver largely because of Britain's liquidity crisis which it painted as an imperial crisis. But barely fifteen years on, when India was saddled with large surplus stocks of the now depreciated metal, the British response was one of self-interested indifference.

Finally, Britain consented to silver stabilisation at the World Monetary Conference in 1933 as a *quid pro quo* for dollar stabilisation.[68]

It is hard therefore to accept the view that, except insofar as it complicated economic and political relations between Britain and the United States at a time when Britain was in need of American goodwill, the effects of the 'dethronement' of silver (as Montagu Norman chose to call it) played a major role in the rejection of the Indian gold standard proposals. The crucial fear was the effect of the latter on the gold market. Despite Britain's return to gold and the relatively easy outlook for it in the early months, the sterling was not quite out of the woods. Britain was still looking to America to keep its discount rates low. On the other hand, the US itself was determined to ensure that she did not have to bear the costs of an European recovery even as American bankers, among others, were tempted by opportunities in Europe. As a result, America's ability to contribute—despite the size of its gold holdings much of which were sterilised—to European recovery was limited. An Indian gold loan would have diverted liquidity from Europe and, besides threatening the British gold standard, it would have also damaged British aspirations to bring the European countries under the monetary influence of London through a sterling-based gold exchange standard.

The rejection of the Indian gold standard proposals did not, therefore, come as a surprise to either Indian or London opinion. The *Times* on its city page had anticipated the conclusions of the report in regard to the exchange rate and the currency system, well before the commission began its sittings.[69] The Indian Merchant Chamber saw that Britain's ability to stay on gold depended "very largely on the action which India is made to take or refrain from taking". Kisch at the India Office thought this reflected "perhaps a little pardonable egotism".[70] But the Indian merchants' views were shared by authoritative sources in London. The Annual Montagu Bullion letter for 1924 said that the Indian exchange was "almost as important (to the UK) as to India itself" and more the gold India takes, greater would be the delay in England's return to gold.

In the event, the Hilton-Young Commis-

ion recommended a "gold bullion standard" involving, on paper, the purchase and sale of gold (the latter for export purposes only) by the government of India in units of 400 ounces or more. Tomlinson has argued that, owing to the ignorance of Delhi officials, in practice, this system worked as a sterling standard.[71] But as we show later, right from the beginning, London officials had no illusions about the system and they expected it to operate as a sterling standard. Indeed, that was the intention behind the scheme. The discussions surrounding the so-called gold bullion standard also reveal just how keen British officials were to ensure that Indian trade was not financed by gold movements, but, instead, by purchases of sterling.

V

Gold-Bullion Standard—Myth and Reality

As early as 1913, Keynes had argued that if it became necessary to shift the gold standard reserves to Inida, it should be ensured that, in a crisis, gold was sold only to the banks and not to the public. Only in the former case, he said (wrongly, as we know from the 1920 experience), could reserves be used to support the exchange.[72] Blackett's proposals that gold bullion should be issued for export against rupees echoed Keynes' reservations. But Hawtrey objected even to the presence of a gold reserve in India. Indian reserves, he felt, were better held in the form of sterling. If you give the "holder of rupees the right to demand gold... at once the sterling reserve becomes inferior in utility...". Further, if Indian authorities were required by law to buy gold, it might be possible to obtain rupees on better terms by sending gold from Durban than by offering sterling. Unless gold was bought in transit and diverted to London, the whole of the additional rupees required for circulation would be issued against gold received in India, which would thus finance a larger part of Indian trade than under an exchange standard. The requirement to sell gold might mean that, in some cases, it could be cheaper to send gold from India to China or Europe at the gold export point than to buy sterling.[73] The "gold policy of India", he said, "ought to be carefully related to the Genoa Resolutions. Whatever gold it is willing to take as a share of the general burden of the world's banking systems, it should buy from South Africa or the United States, but the amount should be agreed, so that the gold using countries of Europe and America may know how they stand."[74]

The opposition of the India Office bureaucracy to a direct link between the rupee and gold is evident from Kisch's testimony to the currency inquiry. To begin with, Kisch refused to admit that there was any difference between a sterling exchange standard and a gold exchange standard. He also said that it was open to question what form the Indian government's obligation to convert rupees should take.[75] He objected to expressing the rupee in terms of gold ostensibly because the price of gold would have had to include transport and insurance which might vary. He suggested that the government of India should sell exchange at par rather than gold.[76]

In the face of pressure from the Indian members in the commission, the India Office found its open anti-gold predilections unsustainable. So there was some backtracking initiated by J Brunyate, an old India Office veteran of many bureaucratic battles. Brunyate supported the idea of expressing the rupee in the form of gold.[77] Kisch also fell in line. On being requested, he produced a draft clause which suggested that the rupee be fixed at "x" grains of fine gold.[78]

Having on the face of it lost the battle to fix the rupee to sterling rather than gold, the India Office proceeded to frustrate a gold-bullion standard for India by other means. Kisch suggested a premium on gold sales by the government, i e, effectively a discount on the rupee. Though such a discount, he conceded, was 'illogical', it was nevertheless of great practical convenience to prevent demand for social purposes of gold from the government of India.[79] With the realisation that it would be impossible, for political reasons, to deny India some form of a 'gold bullion standard', Strakosch and officials at the India Office set about fixing the buying and selling prices of gold in India in a way as to prevent gold going to India for trade purposes even in the new system.

The commission's gold price formula was an outcome of this effort. As Strakosch wrote to Mant, according to this formula, the rupee would have to be "above 1s 6 1/16d" at least, for India to get South African gold. If the shipper of the gold secured forward cover, the cost of the cover would have to be added to the gold import point. Therefore, it would not be profitable to ship gold to India unless the rupee was above 1s 6 5/32d in the market. This, according to Strakosch, compared favourably with the Bank of England's gold price of 77/101/2d per standard ounce and shipped to Bombay at 18 13/64d.[80] A copy of this letter was sent to Niemeyer who noted on the covering letter that whether "gold can be so shipped (or not)... a gold standard bank... can't refuse to buy gold and if it doesn't want to do so, must so control its exchange that it doesn't have to!".[81] It was probably a coincidence that the highest level that the rupee reached in the five years till sterling went off gold was well short of the notional gold import point. But Blackett clearly wished that the rupee should not rise to that level. As he wrote to Strong at the end of a somewhat boastful account of how he had managed to stabilise the rupee, "... it is not impossible that import gold point may be reached in a month or so, which I don't much want but may be unable to prevent ."[82]

Hawtrey, though he was inclined to think that the gold import point was closer to 18 7/32d than to 5/32d, was more pessimistic about the long run impact of an Indian gold bullion standard on British gold receipts from South Africa.[83] He was particularly concerned that as traffic patterns changed, the Durban-Bombay freight for gold, which was currently higher than that for the longer and faster Durban-London voyage, would fall.[84]

On the whole, however, London was less inclined to worry. The cabinet memorandum on the commission's report said the provision for gold sales in India was "... a concession to Indian sentiment..." and was not an essential aspect of the system. The large difference between the buying and selling prices of gold in India meant that bullion could be obtained from the currency authority, only "at ... a disadvantageous price...". Therefore, "...the proposals of the commission will (not) involve any increased demand by the Indian public for gold." The gold reserves required for the new system, the note said, would be acquired gradually. It affirmed that rather than gold, in practice, only sterling would be bought and sold.[85] The Treasury also expressed satisfaction at the commission's rejection of the gold standard proper to which we "took objection".[86]

The Treasury was not alone in supposing that in its actual working, the gold bullion standard would behave really as a sterling exchange standard. Despite the commission's explicit rejection of the latter, within weeks of the report's submission, the India Office had decided that the gold bullion standard need be no different from a sterling standard.[87] Kisch also wrote to a member of the India Office Finance Committee that the "complicated gold bullion standard which the commission proposes" was "largely a make-believe affairs" (*sic*). J Brunyate and

Charles Addis were among the others who expected that the Indian gold bullion standard would work merely as a sterling standard.[88] Later in 1932, when the US blamed the decline in the fortunes of silver and the depression generally on India having gone on gold in 1927, the India Office maintained that India had always stayed on a sterling standard.[89] Nevertheless, the India Office continued to maintain, in public, the fiction of an Indian gold bullion standard till the events of September 1931 stripped it off whatever plausibility it possessed. In contrast, the Indian government thought initially that the new scheme was a step towards a full-fledged gold standard and presented it in India in this light. Delhi attempted, when the legislation was being enacted, to include a provision to coin gold *mohurs* in India. The India Office rejected the move as a back-door method of securing a gold standard and explicitly ruled out a gold coin and a future gold standard for India. The government of India complained that it had been under the wrong impression regarding the true purport of the Hilton-Young Commission's recommendations which they would be guilty of having promoted in India under false pretences![90]

VI

Conclusion

In theory, the gold exchange standard is no different from a gold standard in terms of its impact on the domestic economy. In fact, it has the advantage of yielding a return on a country's reserves. While this holds for a system in which the reserve centre is in equilibrium and in which the reserve currency users are able to exercise freedom of policy, it ceases to be so if the latter condition is violated. If the former condition does not obtain, it becomes more improbable in the colonial context that the latter freedom would be allowed or not be severely constrained.

This was India's inter-war experience. In this period, Britain was experiencing an external disequilibrium. She attempted to transfer a portion of her adjustment burdens to the US (through seeking and trying to promote expansion there) and to India (by promoting deflation or arresting expansion with a view to reducing the Indian demand for gold). In an environment in which she was trying to check even the non-monetary demand for gold in India, she could hardly be expected to indulge the Indian nationalist desire for a gold standard and a gold currency.

Secondly, control over Indian monetary policy was vital to the current British interest of arresting expansion in India. Although there is no evidence that the government of India sought the policy autonomy (however limited) of a gold standard to thwart London's control, it is clear that the British opposition to a direct link between the rupee and gold also reflected the fear that its control over Indian policy would be eroded. It is in this light that the so-called gold bullion standard, which we have shown was expected to work only as a sterling standard, should be seen.

Her control over Indian monetary policy stood Britain in good stead during the depression. The refusal to allow any room for independent action to the Indian government ensured that policy in India in the depression years would be pro-cyclical. The policy-induced accentuation of the depression in India led to substantial dis-hoarding of gold by the householder and large exports of the metal by India. These exports eased Britain's external liquidity problems, aided her recovery and enabled her to manage the sterling in a way as to promote domestic expansion.[91]

32 There is a noticeable contrast between Treasury mobilisation in 1919 and in 1926. In the former case, though the India Office was quite sensitive to the problem of gold for India and the Bank of England also expressed strong reservations, it was left

mainly to Charles Addis on the committee to emphasise the 'general' aspects of the Indian gold demand. There is no evidence of Treasury mobilisation at the committee stage. When the Treasury did move, on the eve of the report's publication, it was forced merely to seek an indefinite delay in implementing those parts of the report that might have increased gold movements into India. Although successful, the nature of intervention suggests that in 1919-20 the Treasury expected the sterling's return to gold to be easier than it was in reality and that they were perhaps more sanguine about the threats posed to the sterling and the position of London as a financial centre by the countries of the Empire. The Treasury in 1926, in contrast, betrayed a gloomier outlook for the sterling and the gold standard. Certainly, the travails of the sterling and the British economy in the intervening years, and the circumstances in which the sterling was virtually hustled on to gold might have justified the gloom. Also, the reduced dependability of the dominions in monetary matters (for example, the behaviour of South Africa and Australia in 1924 and 1925) may have persuaded the Treasury of the advantages of an early move to restrict the freedom for manoeuvre of another colony which was on the verge of stabilising. How far its experiences with South Africa and Australia educated the Treasury and contributed to its determination to resist an advance towards monetary autonomy in India is also a point worth considering.

Reports Submitted by Arthur Notman and H A C Jenison", Section xvii.

51 IOLR V/26/302/8, Qn 13740. Dr Hollander, a member of the Strong delegation told the commission (Qn 15232) that the damage to US silver interests who represented a "great American industry" would raise an outcry so loud that, it might even lead to "an outright prohibition" on all foreign loan flotations in the US.

52 IOLR V/26/302/8, Qns 13149 and 13045 respectively.

53 The Indian experience with silver was notable also because a large part of its holdings of the metal had been bought at artificially high prices when the world's demands for India's exports were pressing and importers would have gone to great lengths to procure the necessary first class financing. Kisch regarded Indian silver sales as an act of 'ill-grace' towards America which had striven to 'benefit' India through the Pitman Agreement; see IOLR V/26/302/8, Qn 10815. But more detached accounts suggest that American profits and Indian losses on the unfinished part of the deal covered by UK's debt to the US in 1933 was, owing to the fall in silver prices, 66 million ounces; see PRO T160/8, F260/3, "Pitman Silver", Bowley's memorandum dated February 1933.

87 IOLR L/F/7/2286, Colln 375, F 15, Kisch's 'Review of Report of Currency Commission' dated early July 1926.

88 IOLR L/F/7/2287, F 16 of Colln 375, Kisch to Goodenough, letter dated September 15, 1926; SOAS Addis Papers, Pp Ms 14/557, Draft Reply to J B Brunyate dated November 12, 1926 expressed agreement with the latter that the golden bullion standard was unlikely to be "operated in practice". It is noteworthy that Brunyate who had earlier seemed to support the idea of linking the rupee to gold rather than through sterling should later hold this view about the inoperability of the gold bullion standard. One explanation for the apparent contradiction may really relate to the habits of the civil servant. He may have chosen to go along with a clamour of the moment (i e, some sort of a gold standard for India) while hoping to frustrate its implementation at a later stage. This may also help explain the change in the tenor of Kisch's testimony after Brunyate expressed himself in favour of a link between the rupee and gold.

In his notes for a speech as chairman of the Hong Kong and Shanghai Bank, Charles Addis went further than Brunyate and said (Pp Ms 14/558, 'Notes for a Chairman's speech', December 1926) the gold bullion standard was "intended to be inoperative". It bears noting that Addis had been involved in a "great powwow on gold for India" with Norman and Strakosch when the commission moved to London after taking evidence in India.

89 PRO T160/547/F3420/3, Baxter to Waley, letter dated April 18, 1932 and T160/488/F13017/04, draft financial memorandm "Some Aspects of the Silver Question" prepared jointly by Treasury and India Office for the World Monetary and Economic Conference of 1933, para 6(iv). Appendix B to this memorandum was on 'The Position of Silver in Relation to the Indian Currency System'.

HOECHST INDIA LIMITED

FORM II A

(See Rule 4A(1))

Form of general notice to be given to the members of the public before making an application to the Central Government under sub-section (2) of section 22 of the Monopolies & Restrictive Trade Practices Act, 1969.

NOTICE

It is hereby notified for the information of the public that **HOECHST INDIA LIMITED** proposes to make an application to the Central Government in the Department of Company Affairs, New Delhi, under sub-section (2) of section 22 of the Monopolies & Restrictive Trade Practices Act, 1969 for approval to the establishment of a new undertaking/unit/division. Brief particulars of the proposal are as under:-

1. Name and address of the applicant	:	**Hoechst India Limited** Hoechst House Nariman Point 193, Backbay Reclamation Bombay 400 021.
2. Capital structure of the applicant organisation	:	Authorised Capital: Rs. 100,000,000 divided into 1,000,000 Equity Shares of Rs. 100 each. Issued, Subscribed and Paid-up Capital: Rs. 95,769,000 divided into 957,690 Equity Shares of Rs. 100 each.
3. Management structure of the applicant organisation indicating the names of the directors, including managing/whole-time directors and manager, if any	:	The Company is managed by the Managing Director under the overall supervision and control of the Board of Directors. Names of Directors: MR. VIJAY MALLYA (Chairman) DR. E. BALTIN (Managing Director) MR. S. V. DIVECHA MR. C. L. JAIN (Whole-time Director) DR. H. G. JANSON MR. F. A. HONIGMANN (Alternate to DR. H. G. JANSON) PROF. DR. G. KORGER MR. D. LAENGENFELDER MR. H. J. TIMNER MR. P. N. VENUGOPALAN
4. Indicate whether the proposal relates to the establishment of a new undertaking or a new unit/division	:	New Unit
5. Location of the new undertaking/unit/division	:	Ankleshwar Dist. Bharuch Gujarat State
6. In case the proposal relates to the production, storage, supply, distribution, marketing or control of any goods/articles, indicate:		
i) Names of goods/articles	:	BARALGAN KETONE & Formulations based thereon
ii) Proposed licensed capacity	:	5 Tonnes p.a.
iii) Estimated annual turnover	:	Rs. 9.6 Mio approximately at full capacity.
7. In case the proposal relates to the provision of any services, state the volume of activity in terms of usual measures such as value, income, turnover, etc.	:	Not Applicable
8. Cost of the project	:	Rs. 5.0 Mio
9. Scheme of finance, indicating the amounts to be raised from each source	:	From the internal sources of the Company

Any person interested in the matter may make a representation in quadruplicate, to the Secretary, Government of India, Ministry of Industry, Department of Company Affairs, Shastri Bhavan, New Delhi within 14 days from the date of publication of this notice, intimating his views on the proposal and indicating the nature of his interest therein.

FINANCE DIRECTOR & SECRETARY

Dated this 28th day of August, 1989.

Poverty Alleviation Programmes

IRDP in an Andhra Pradesh District

G Hara Gopal
C H Bala Ramulu

The polarisation of rural society brought about by the early development exercises, like the green revolution, and the consequent unrest prompted the introduction of several poverty alleviation programmes in an attempt to ward off the dangers inherent in such situations. This paper's empirical examination of one such scheme—the IRDP in Andhra Pradesh identifies characteristics of the programme which prevent it from being effective. A major flaw is its tendency to benefit better off regions as compared to poorer regions thus rendering it self-defeating.

I

PUBLIC policies to alleviate poverty have come to assume vital importance in post-independent India. The state, through a number of public policies, seeks to intervene in the developmental process as a part of its legitimisation strategy. In post-independent India there was hardly any rural development policy which did not lay emphasis, overtly or covertly, on rural poverty. The community development in the fifties and panchayati raj in the sixties was intended to ensure peoples' participation and improving living conditions of rural people. Along with these institutional devices, there has been emphasis on modernising agricultural and industrial base. The growth with distribution approach created its own problems calling for new policy initiatives. For instance the green revolution of the mid-sixties, while it benefited better off sections, adversely affected the rural poor, which includes small and marginal farmers and agricultural labourers.[1] This led to the widening of the gulf between various sections of the society resulting in considerable unrest in the rural areas. Consequently, the first half of the 70s was dominated both by a discussion on the large-scale poverty in rural India and formulation of programmes to stem the tide of unrest. Prominent among these programmes were the SFDA and IRD programmes. The total experience with the operation of target group programmes is almost seventeen years now. IRDP has completed nine years. Therefore, it is time that the experience with the programme is reviewed to gain an insight into this policy initiative.

An evaluation of performance of SFDA/MFALDAs done for the whole nation indicates that in ten years (1970-80), the agencies identified 161.31 lakh families, of which 67.71 lakh families were covered.[2] This works out to 42 per cent of the total identified members of the target group. Under IRDP, the total number of beneficiary households covered during the first four years of the Sixth Plan was 125.9 lakh.[3] The coverage under the target group programmes both SFDA/MFALDA and IRDP, in about fifteen years, works out to 286.90 lakh beneficiaries. The coverage has been 19.12 lakh beneficiaries per year in the country.

It is to be noted that evaluation studies by RBI NABARD had reported 15 to 20 per cent wrong identification.[4] In certain states this ranged from 47 to 70 per cent.[5] The poorest have been covered the least.[6] Added to it, the number of poor persons in rural India has grown at the rate of 5 million a year during 1958-73.[7] The same trend prevailed during the Sixth Plan.[8] This unimpressive coverage gives rise to serious doubts about the overall effectiveness of this policy approach. The number of those crossing the poverty line has been marginal. There are wide variations, ranging from three[9] to fifty per cent,[10] in the estimated number of persons who crossed the poverty line. In certain cases, it is reported, none crossed the poverty line.[11] Further, mere crossing of the poverty line does not guarantee its sustainability.[12] In terms of an income mobility criterion, it is observed that the lowest income groups have the least income mobility compared to the other income groups.[13]

The studies on IRDP highlight limitations which include weak planning,[14] lack of infrastructural facilities,[15] indifference to the differences in the levels of infrastructure and incidence of poverty,[16] lack of intersectoral linkages,[17] lack of co-operation among the aiding agencies,[18] involvement of middlemen or *pyraveekar*,[19] wrong identification of the beneficiaries,[20] cornering of benefits by the rich,[21] non-utilisation of funds,[22] cumbersome rules and regulations,[23] pervasive bureaucratic apathy and cynicism,[24] anti-rural poor attitude based on class linkages,[25] manning of the administration with unqualified and untrained staff at various levels,[26] delay in grounding the schemes,[27] insensitivity to the priorities of the beneficiaries or their ability,[28] and regional imbalances in the distribution of funds.[29] The problems of non-percolation, political pressure and corruption are serious problems which originate from the socio-economic structure.[30] Another major weakness in the strategy is that the rural development programmes are worked out the implemented without the involvement of the people concerned with these schemes.[31] All these factors, the studies conclude, collectively rendered these schemes ineffective.

The present study seeks to examine the impact of the economic environment in terms of logic of the existing structure, on performance of IRD schemes. It is assumed that advancement of the region or place or better off conditions of the individual beneficiary, all rooted in the structure, have a decisive impact on poverty alleviation programmes. We also assume that the intiative, as far as these schemes are concerned, rests more on the existing socio-economic conditions than with the policy as such. This suggests that autonomy of the policy to intervene and cause qualitative change in the overall economic conditions of the poorer sections is quite marginal. It is this aspect that is examined in this paper.

II

In this section an attempt is made to present the micro-level characteristics of the state of Andhra Pradesh for a better understanding of the micro-level experience with IRDP.

Andhra Pradesh is divided into three geographical regions: Telangana, Rayalaseema and coastal Andhra. The population of the state, according to 1981 census, was 535 lakh, which forms 8.14 per cent of the total population of the country. In terms of area, the state ranks fifth at the all-India level. In terms of literacy 29.72 per cent of the people were literte in 1981 as against 36.12 per cent at the all-India level. The rural population of the state is 410 lakh. The state is predominantly agricultural and 76.75 per cent of the population continue to depend on rural sector. The proportion of cultivators to the total workers is 32.60 per cent as against 41.55 per cent at the all-India level.[32]

The studies on poverty in Andhra Pradesh (1971-72,[33] 1977-78,[34] 1981-82[35]) indicate that there has been no decline in the incidence of poverty. Table 1 indicates that in certain districts the poverty levels increased during 1977-78 to 1981-82. The increase is more in the districts of Nellore (coastal Andhra), Chittoor (Rayalaseema), Nalgonda and Khammam (Telangana). The latest estimates (1981-82) indicate that incidence of poverty is more in the Telangana and Rayalaseema regions compared to coastal Andhra region. The percentage of families below the poverty line, according to 1981-82 estimate, is 44.57. It is this high poverty that

poses a formidable challenge to poverty alleviation programmes.

The coverage of target groups from the Fourth Plan to the Sixth Plan is presented in the Tables 2 and 3. The coverage under SFDA indicates (Table 2) that out of the total 55,18,282 target group households, 4,80,899 (9 per cent) families have been assisted. The per year coverage comes to less than one per cent. Under IRDP 12,15,785 households have been covered during the Sixth Plan. The coverage works out to 22 per cent of the total target group households in Andhra Pradesh. The year-wise coverage comes to 4.40 per cent. The coverage of small farmers has been relatively more than that of the marginal farmers and agricultural labourers, who constitute hard-core of the poor (Table 3).

The state level details further indicate that the coverage of beneficiaries has not been even in all the regions and the districts. For instance the percentage of coverage in the advanced coastal districts like East Godavari, West Godavari, Krishna and Guntur has been relatively higher than other districts. Similarly the coverage of the small farmers has been higher than the agricultural labourers. This micro level picture indicates that the IRDP has a built-in tilt towards relatively better off farmers and more advanced regions. The present study seeks to further examine its impact on the target groups in the backward Telangana region of Andhra Pradesh.

III

In the Telangana region, which is relatively backward, the first SFDA was started in Nalgonda district in the year 1970-71. Since no district could be considered representative of the phenomenon, it was thought that Nalgonda which has had benefit of the schemes from its inception can be considered a suitable site for an impact study. While the findings may not be totally applicable to the whole state, the insights that it provides can be useful.

The following are the other details about the district of Nalgonda. The occupation of 75 per cent of the people in the district is agriculture. The growth rate of population has been 2.5 per cent. The total acreage is 35,14,630. The total cropped area constituted 58.2 per cent in 1971 and 52.0 per cent in 1981. The growth rate has been negative, i e, −1.0 per cent. This indicates a decline in the cropped area (Table 4). The net area sown to the geographical area in 1971 was 47.5 per cent. This declined to 44.9 per cent in 1981 indicating −0.55 per cent growth rate per year. Similarly area sown more than once had also declined at the rate of −3.3 per cent per year. Added to it, the area sown more than once accounted for only ten per cent and seven per cent of the total geographical area in 1971 and 1981 respectively. The percentage of net irrigated area to the total geographical area comprised 14.6 per cent in 1971 and 12.2 per cent in 1981 and the growth rate has been 1.6 per cent per year. Obviously such developmental trends enhance the importance of policy intervention.

The landholding pattern in the district, according to 1976 agricultural census, indicates that 85.2 per cent of the land was in the hands of upper strata while the target group members owned only 14.8 per cent of the land (Table 5). This land is infertile and unirrigated. Such a situation would condition effectiveness of schemes meant for the poor.

The study on levels of living in Andhra Pradesh has put Nalgonda district in the middle range. This rating was based on per capita expenditure and per capita gross domestic product. The per capita annual expenditure and gross domestic product of the people during the year 1977-78 was Rs 72.45. The agricultural classes' per capita monthly expenditure was Rs 73.70. The per capita monthly expenditure of agricultural labourers was Rs 55.85.[36]

In the year 1977-78, on the basis of the desirable minimum of Rs 50 per capita monthly expenditure, the study estimated that 5.78 lakh persons (30 per cent) were living below the poverty line. This has been worked out to 1.03 lakh households (27.38 per cent) living below the poverty line in the district.[37] However, the base line household survey, which was conducted by Nalgonda DRDA in 1980-81 indicates that there were 2,27,963 families (50 per cent) living below the poverty line. This includes families belonging to scheduled caste (68,575), scheduled tribe (31,607), backward castes (1,03,384), and economically backward classes (24,397).[38] It is these economic facts that condition the nature of the schemes and their final outcome.

The details of performance of the IRD programme are as follows. As per the guidelines of the government of India each SFDA was expected to cover 50,000 families.[39] While the agency in the district ought to have covered one lakh target group in the ten years of its existence, it could cover in all 49,972 families.[40] This works out to 50 per cent of the target fixed. Given the total number of target group (2,27,963), the number of families (49,972) covered works out to little over one-fifth (21.9 per cent) of the total target group. This works out to 2.1 per cent per year.

The experience under IRDP during the Sixth Plan is no better. During the Sixth Plan each block was expected to cover 3,000 families. In this regard the DRDA Nalgonda, which consists of 15 blocks, was expected to cover 45,000 families. It is significant to note that the coverage works out to less than one-fourth (23.4 per cent) of the total families (2,27,963 families) below the poverty line in this district. The per year coverage works out to 4.6 per cent, while it is 5.7 per cent at the state level. At this rate it would take about 25 years to merely cover the entire target group, not to speak of their crossing the poverty line.

Table 1: Poverty Levels in Andhra Pradesh in 1971-72, 1977-78 and 1981-82

Districts	Percentage of Families below the Poverty Line		
	1971-72	1977-78	1981-82
1 Srikakulam	74.24	68.76	55.22
2 Vijayanagaram	—	—	51.47
3 Vishakapatnam	95.65	53.36	45.98
4 East Godavari	64.28	44.56	28.62
5 West Godavari	64.10	35.08	35.76
6 Krishna	46.15	32.93	29.46
7 Guntur	50.00	31.43	33.15
8 Prakasham	82.50	44.90	37.94
9 Nellore	63.33	39.91	50.07
10 Kurnool	20.55	61.89	42.35
11 Anantapur	80.26	67.64	50.14
12 Cuddapah	77.77	43.98	43.37
13 Chittoor	79.34	49.36	61.26
14 Hyderabad (Ranga Reddy)	71.79	57.29	47.98
15 Nizamabad	74.28	41.62	41.10
16 Medak	95.25	67.54	48.70
17 Mahabubnagar	73.97	60.21	52.88
18 Nalgonda	.37	27.38	46.77
19 Warangal	78.43	69.79	47.20
20 Karimnagar	87.17	76.98	43.30
21 Khammam	76.19	36.96	41.58
22 Adilabad	82.97	65.80	53.24
Andhra Pradesh		50.79	44.57

Notes: Poverty line: Rs 40/- in 1971-72; Rs 50/- in 1977-78 and Rs 61.30 in 1981-82.

IV

For the purpose of this study three blocks were selected. The blocks have been classified into three groups, i e, developed, medium and less developed, taking irrigation as proxy for agricultural development. From each group one block—Kodad, Bhongiri and Chintalapally—has been selected at random. On the criterion of poverty and the number of households below the poverty line, the three blocks occupy the relative position in that order (Table 6).

Regarding the blocks selected in the district, the following are the details. The population figure of the developed, medium and less developed blocks are 1.84 lakhs, 1.37 lakhs and 1.01 lakhs, respectively (Table 7). The percentage of urban population is higher in the medium developed block (18.2 per cent) followed by developed block (9.9 per cent). The percentage of total workers to the total population is little more in the medium developed block (52 per cent) compared to the developed block (50 per cent) and the less developed block (47.3 per cent). The percentage of cultivators to the total workers is more in the less developed block (42.2 per cent) compared to the other two

TABLE 3: NUMBER OF BENEFICIARIES (CATEGORY-WISE) COVERED UNDER SFDA AND IRDP IN ANDHRA PRADESH

Sl No	Category	Target Group in 1971-72	Target Group Families Covered under SFDA up to 1978-79	Percentage of Col No 4 over Col No 3	Target Group in 1981-82	Target Group Families Covered under IRDP	Percentage of Col No 7 over Col No 6
1	2	3	4	5	6	7	8
1	Small farmers	2,26,016	1,68,928 (39.1)	74.74	3,03,642	2,00,735 (16.51)	66.11
2	Marginal farmers	5,19,838	1,99,297 (46.1)	38.34	7.51.875	3,78,523 (31.13)	50.34

blocks. It is 34.7 per cent and 31.5 per cent in the developed and less developed blocks respectively. The percentage of agricultural labourers to total workers is 45.65, 32.89 and 40.00 in the developed, medium and less developed blocks respectively.

The gross cropped area is a little more in the less developed block (0.63 lakh hectares) compared to the developed block (0.59 lakh hectares) and the medium developed block (0.42 lakh hectares). The percentage of gross irrigated area to gross cropped area is very low in the less developed block (9.52 per cent). It is 55.9 per cent and 35.71 per cent in the developed and medium developed blocks respectively. Added to it, the percentage of net area irrigated by canals to net area irrigated is 86.2 per cent in the developed block and 10.0 per cent in the medium developed block. There is no irrigated area under canals in the less developed block (Table 7).

The landholding pattern of the developed, medium and less developed blocks, according to 1976 agricultural census, indicates that those who possess less than five acres of land accounted for 55 per cent, 62 per cent and 42 per cent of the holdings respectively (Table 8). The land they possessed accounted for 18 per cent, 9 per cent and 8.8 per cent of the total area respectively. It is significant to note that the farmers who possessed above ten acres accounted for 20 per cent, 13 per cent and 33 per cent of the landholdings but control total land of 60 per cent, 73 per cent and 75 per cent in the developed, medium and less developed blocks respectively. This indicates the skewed distribution of land in these three blocks.

The data suggests and also confirms the earlier findings that advanced regions attract more loan amounts than the backward blocks. The study further seeks to examine the impact of various schemes on individual beneficiaries in different villages. This is the last and most crucial stage in the analysis of the anti-poverty schemes like IRDP. For this purpose a sample on the villages and beneficiaries has been drawn.

V

Sampling Design: The study employed a multi-staged sampling method in selecting the villages and beneficiary households. To get an overall picture of the programme, the secondary data about the number of families covered under the schemes in all the villages of the selected blocks was collected. The villages were organised in ascending order according to the coverage of beneficiaries under IRDP and were stratified into three groups which contain equal number of beneficiaries. From each group two villages were selected giving weightage to the coverage of beneficiary households. Thus, by selecting six villages from each block the study in all covered 18 villages in the district.

The selected villages were surveyed twice. First, a census survey was conducted covering all the beneficiary households of the sample villages. The objectives of this survey included: (i) assessing the number of beneficiaries who continue to own the given asset; (ii) identifying the number of beneficiaries who disposed the asset and the reasons thereof; and (iii) estimating the number of wrongly identified beneficiaries. The first survey indicates that in all 600 households were covered under IRDP. From this the survey could get information from 547 households.

From this 547 it was revealed that 218 (40 per cent) households possessed the assets while others (60 per cent) do not possess them for various reasons. (The reasons are discussed in the latter part of the paper.). From the 218 households a sample of 96 was drawn for a detailed analysis. While drawing the sample due care was taken to see that the range of the schemes and the socio-economic stratification of the beneficiaries found adequate representation. As the schemes are unevenly distributed, uniformity in the sample could not be maintained.

To examine the impact of the IRDP on living conditions of the recipients some of the studies adopted the 'Before and After Method'. In this method, the income before the scheme and after the scheme is considered and benefit of the difference between the two incomes is given to the IRDP scheme. Some of the studies also considered the 'controlled group'. In this method income of the recipients of the schemes and income of their counterparts from the non-recipient

groups is compared. In these two methods the reliability of information depends on the memory of the recipients about their income. The present study in view of the above limitation took 1986-87 income from IRDP and non-IRDP activities. This would help us in estimating the income accrued from the IRDP schemes. It is hoped that this method would elicit relatively more reliable information about the income.

Distribution of the Beneficiaries: The distribution of beneficiaries under different schemes in the eighteen villages is presented (Table 9). The scheme-wise coverage of beneficiaries indicates that a large proportion of them (41 per cent) are covered under minor irrigation schemes followed by animal husbandry schemes (34 per cent). The coverage of beneficiaries under agriculture (14 per cent) and ISB (10 per cent) seem to be low.

An examination of distribution of beneficiaries in selected villages indicates that out of the 547 beneficiaries, half of them belong to the developed block, further confirming the earlier finding that advancement of the region itself is an important variable. The medium and less developed blocks account for 22 per cent and 27 per cent of the beneficiaries respectively (Table 9). Scheme-wise coverage indicates that in the developed block, more than half of the beneficiaries (54 per cent) are covered under animal husbandry schemes. In the medium and less developed blocks the beneficiaries covered under minor irrigation schemes account for 84 per cent and 66 per cent respectively. It is striking to note that the Nalgonda DRDA accorded greater priority to the minor irrigation schemes in the relatively backward areas. This suggests the propensity on the part of the development agencies to extend the benefit of loan in backward blocks to those who have land. This fulfils the security criterion and also target coverage. Consequently the landless agricultural labourers in the relatively backward blocks remain the most neglected in the overall coverage of target groups.

Distribution of Subsidy and Loan in Different Blocks: An examination of distribution of financial assistance (loan and subsidy) reveals that in the developed and medium developed blocks, the amount (35 per cent each) distributed is the same while it is slightly lesser in the less developed block (30 per cent). In the developed block a sizeable amount (50 per cent) is spent for animal husbandry while in medium and less developed blocks large amounts, i e, 94 per cent and 82 per cent are spent on minor irrigation (Table 10).

The Caste-wise and Category-wise Coverage: The coverage of SCs and STs is about 45 per cent of the total beneficiaries. The BCs and FCs constitute 40 per cent and 15 per cent of the beneficiaries respectively (Table 11). The coverage of scheduled castes under all the schemes is by and large identical. They are covered mainly under

Note: The figures in brackets are low row percentage.

agricultural and animal husbandry schemes. In the case of STs 60 per cent are covered under minor irrigation schemes. In the case of backward castes most of them are covered under animal husbandry (52.3 per cent) followed by minor irrigation (35.6 per cent). In contrast a large chunk of the forward caste (FCs) beneficiaries (82.1 per cent) are covered under minor irrigation schemes. This has a direct linkage with the land ownership pattern and also the general economic activity in the region.

The category-wise coverage of the beneficiaries indicates that about three-fourths of them belong to target group (Table 12). Of these beneficiaries most of them belong to marginal farmers (41 per cent) followed by small farmers (24 per cent). A negligible percentage of agricultural labourers (6 per cent) and rural artisans (3 per cent), who constitute the hard core of the poor, are covered under the schemes. It is important to note that about one-fourth of the beneficiaries belong to non-poor category, i e, medium and large farmers.

The Utilisation of the Schemes: An examination of utilisation of the schemes in the district indicates that 40 per cent of the beneficiaries retained the schemes (Table 13). And a negligible 5 per cent of the beneficiaries are in partial possession of the schemes. Another 7 per cent of the beneficiaries disposed the schemes and purchased new assets. Some of the beneficiaries (5 per cent) resorted to 'artificial purchasing' of the schemes[41] and diverted the amount for some other purposes. A few beneficiaries (1.4 per cent) did not receive the schemes although their names are included in the list of beneficiaries. As many as 42 per cent of the beneficiaries do not possess the schemes. This occurred largely in the case of animal husbandry schemes. The non-possession of the schemes is a result of consumption and other domestic needs which took precedence over the utilisation of the schemes for the intended purposes.

An analysis of utilisation of the schemes reveals that nearly two-thirds of the forward castes (63 per cent) and more than half of the STs (54 per cent), retained the assets (Table 14). About one-fourth of the SCs and 38 per cent of the backward class beneficiaries also retained the asset. This indicates that more than two-thirds of the SCs (68 per cent) and more than half of the backward classes (56 per cent) do not possess the assets.

On the category criterion the utilisation of the schemes is more among the large and medium farmers followed by the small farmers (Table 15). About three-fourths of the large farmers, a little over two-thirds of the medium farmers and more than half of the small farmers availed the schemes. In contrast 90 per cent of the agricultural labourers, 81 per cent of the marginal

farmers and rural artisans do not possess the assets at all.

The scheme-wise non-retention indicates that 62 per cent of the agricultural schemes, 89 per cent of the animal husbandry schemes and 80 per cent of the ISB schemes are not retained (Table 16). Only a negligible percentage of agricultural schemes (16 per cent) and animal husbandry schemes (7 per cent) are retained. It is significant, however, to note that 80 per cent of the minor irrigation schemes are retained. This demonstrates that irrigation schemes have a built-in potential for retention. This seem to be more pronounced when they are given to the better off farmers.

Reasons for the Non-Utilisation of the Schemes

An examination of the reasons for non-utilisation of the schemes is useful in understanding the phenomenon. In the case of agricultural schemes more than one-fourth (26 per cent) of the respondents reported that the asset was defective, non-viable and unsuitable to the local conditions. There were complaints of high cost of feed and fodder and lack of working capital. Another 29 per cent of them reported that their socio-economic necessities compelled them to dispose the schemes. Another 12 per cent of the respondents disposed the schemes to acquire new asset and 8 per cent did it to clear old debts.

In respect of animal husbandry schemes 44 per cent indicated that the socio-economic conditions and outstanding debts forced them to dispose of the IRDP assets. 56 per cent of the beneficiaries reported the same reasons such as defective, non-viable and unsuitable nature of the scheme as was reported earlier.

In the case of minor irrigation schemes about one-fourth of the beneficiaries in the developed and less developed blocks and a negligible percentage (10 per cent) in the medium developed block do not possess the schemes given by the DRDA. If we look at the district picture, one-fifth of the beneficiaries do not possess the schemes. The reasons for not maintaining the schemes are mostly the socio-economic necessities of the beneficiaries. The beneficiaries who belong to the less developed block account for this condition. Added to it, lack of working capital, lack of adequate land, defective schemes, (oil engine/electric motor) and old debts made beneficiaries dispose of the schemes.

The total amount received by the beneficiaries, who disposed of agriculture, animal husbandry and minor irrigation schemes, was Rs 4,83,891. An analysis of pattern of expenditure reveals that, a large amount, i e, Rs 2,78,101 (57.4 per cent) was spent on domestic and other socio-economic needs of the beneficiaries. However, a considerable percentage (28.2 per cent) of it was repaid to the financial institutions to clear of IRDP loans. Another 13.4 per cent was spent on purchase of the new assets.

VI

An analysis of impact of IRDP schemes on employment and income of those beneficiaries who retained the schemes is as follows:

It can be observed from Table 17 that average employment generation under all schemes worked out to 96 days. The estimated employment from agriculture and minor irrigation schemes per beneficiary household was 82 and 76 days respectively. The sheep unit has a high potential for generation of employment (300 days). The employment generation under minor irrigation schemes was lesser compared to other schemes. This is due to drought and rig

Note: The figures in brackets are the percentages to the row total.

technology which reduces water levels in the wells. The category-wise analysis reveals that employment generation is higher in the case of medium and large farmers compared to marginal and small farmers. It is important to note that marginal farmers mostly received sheep unit which generated employment almost throughout the year.

Income Generation: The impact of IRDP reveals that the schemes did not generate sufficient income to the beneficiary households. However, the net income[42] generation under minor irrigation schemes (Rs 446) was more compared to other schemes. In the case of agricultural schemes the net income works out to Rs 293. The beneficiaries of animal husbandry suffered loss of income to the tune of Rs 280. The category-wise analysis reveals that the marginal farmers in the case of agriculture and animal husbandry schemes, and the medium and large farmers in the case of minor irrigation schemes received more income.

Capital Out-put Ratio: The estimated capital output ratio is presented in Table 18. To gain one rupee worth of income from the investment the beneficiary household spent Rs 3.58, Rs 7.02 and Rs 8.76 on agriculture, animal husbandry and minor irrigation schemes respectively. By and large the capital-output ratio was more for small and medium farmers under all schemes.

IRDP and Improvement in Income Levels of Beneficiaries: Of the 96 sample beneficiaries four beneficiaries were non-poor, whose non-IRDP income was more than Rs 6,401. This is a case of wrong identification. Among the target group beneficiaries (92 beneficiaries) only 3 per cent crossed the poverty line (Table 19). These are minor irrigation beneficiaries. About 18 per cent[43] improved their income and 43.3 per cent remained in the same income category. However, the income of 39 per cent of the beneficiaries declined. This trend is more pronounced under animal husbandry scheme followed by minor irrigation schemes. It is reported that high maintenance cost of the scheme, crop failure and low prices for the output account for this phenomenon.

CONCLUSION

The IRDP has been one of the important policy initiatives intended to alleviate large-scale poverty in rural India. The experience indicates that a target-oriented programme is fraught with innumerable problems. Several evaluation studies confirm the wide gap between promise and performance. The macro-level data suggests that the coverage of target groups in Andhra Pradesh has been very low and the impact on incidence of poverty is marginal. The data further suggests that the districts which are relatively more advanced showed better performance than the districts which are backward and situated in less developed regions. This further indicates that benefits percolated largely to the fertile and irrigated areas.

An analysis of the micro-level data at the district level and below also exhibits a similar trend. The blocks which are relatively better off attracted the schemes and loans more than the blocks which are backward and underdeveloped. The village and beneficiary-wise data also reveals that the better off members of the target group located in irrigated belt took advantage of these schemes. It is significant to note that while the agricultural labourer from the better off regions received the benefits, the landown-

ing members in the backward regions derived some benefit. The scheme-wise and beneficiary-wise preformance reveals that minor irrigation schemes—which are land-based—have given a better account of themselves than the non-land-based schemes. The non-land-based schemes like cart and bullock, and sheep proved beneficial only where the members owned some land.

The most neglected segment of this development strategy is agricultural labour, particularly of the underdeveloped regions. In most of these cases they have not been able to utilise the schemes and have diverted them for other purposes. It is noticed that the loan amount went into consumption basket. It is natural and logical that the members of the target group whose economic conditions are at the level of subsistence cannot invest the amount in the income generating sectors as day-to-day consumption needs take precedence over other considerations.

The above analysis brings out two dimensions of public policy. These dimensions have not been sufficiently articulated by the earlier studies. The better off regions and the beneficiaries have a built-in gravitational pull. The policy has a propensity to respond to the better off conditions rather than create those conditions for effective implementation of the programme. This indicates the failure of the policy, both in terms of its capacity to intervene and also transform the existing condition in which the poor people have been trapped for centuries.

40 The point to be noted here is that not all families who were covered under SFDA/IRDP really belong to the category of poor. The studies on IRDP in Andhra Pradesh pointed out that about 30 per cent of beneficiaries are not really belong to the category of poor. For details see Bala Ramulu C H, *Evaluation of IRDP in Nalgonda District of AP: Case Study of a Public Policy,* Centre for Economic and Social Studies, Hyderabad, 1988; Galab, S *Effectiveness of IRDP in Drought Prone Areas—A Case of Ananthapur District,* CESS, Hyderabad, 1987.

41 Artificial purchasing means the beneficiary or middleman will arrange their own or others sheep, goats, buffaloes, plough bullocks, etc, for a few hours to show before the purchasing committee.

42 While calculating net income the paid out cost, depreciation on the asset and interest on the capital is taken into account.

43 This includes the beneficiaries who crossed the poverty line.

Mounting Antagonism towards Big Dams

Chandrashekhar Pant
Shripad Dharmadhikary

THIS is with reference to the article 'Mounting Antagonism towards Big Dams' by B D Dhawan (May 20). In general, the tone adopted by Dhawan is that anybody and everybody is today criticising the large dams, while irrigation engineers and planners are maintaining a total silence on the issue. He also implies that if they really start speaking out, then the arguments of the critics would stand exposed as baseless. Dhawan talks about hard critics and soft ones, saying that the hard critics raise objections on discipline-specific grounds and that the soft ones have only a woolly understanding of the issue. These distinctions of hard and soft are, in fact, an artificial creation of Dhawan's imagination. In fact, not only are the critics raising very important objections on discipline specific grounds, but are going much beyond this. It is these critics who have really understood the complex nature of water resources, ecology, environment and the interrelations of all these to the development process of the country. Through their understanding of the issue in a holistic manner, these critics are able to present an integrated, holistic criticism of the problems of large dams in the socio-political-economic context of our country. It is of course impossible to expect that the irrigation planners, trained as they are to stick to their own disciplines and departments, to even begin to understand this holistic viewpoint. No wonder then, that they, and their spokesman (as Dhawan appears to be), unable to grasp these ideas, are forced to take a defensive stand by calling the critics 'woolly'.

Dhawan (BDD henceforth) says that just as the planners cannot be right all the time, so cannot the hard critics. Now this statement is ridiculous, to say the least. As anyone with a little understanding of logic will point out, what prevents the planners from being right all the time? And how does it follow from this that the hard critics cannot be right all the time? These kinds of statements are just evasive attempts to avoid answering the critics. This same absence of logic can be seen later on in the article which says that 'middle paths' (like reduction in the height of the dam) are well suited to a democracy. One really wonders from where BDD got this strange notion about middle paths being suited to a democracy. How can any path, other than the one that is fully committed in the interests of the masses, be the correct one in a democracy? A democratic society does not permit any compromises on the interests of the masses, and wherever such compromises have been made, it is a defeat for democracy.

BDD says that "why irrigation planners are disinclined to a public dialogue on the issues of public concern we need not pursue here". This statement in fact negates the whole article. We believe that this is the crux of the issue. Unless we explore the reasons behind this silence of the irrigation planners, we shall not be able to understand how these kinds of projects are conceived, planned and executed in our country. And unless we understand this crucial aspect, we shall not be able to see the tremendous vested interests that ensure the continuance of these kinds of projects in spite of the solid body of evidence that has accumulated against them. In fact, the reason why the planners are 'disinclined' to speak out is that in an open, fair debate, not only would these vested interests (like the routine ten per cent, foreign trips, lavish meeting in five star hotels, etc) be exposed, but they would also be not able to counter the objections of the critics. In fact, they are afraid that the critics would use the planner's data itself to support their own arguments!

BDD calls upon the planners to share their information with other professionals. In fact, we demand this sharing, not as a defence of the planners, but as a part of our fundamental right to know.

In the specific case of the dams on the Narmada, Sardar Sarovar and Narmada Sagar, which engineer or planner would have dared to put the following official informations on public forums?

(1) While arguing their case in front of the Narmada Water Disputes Tribunal, each state put exaggerated claims of its ability to make use of the Narmada waters, so that it would be allotted maximum share of these. That is how the Narmada Valley Project now consists of over 3,430 dams, a large number of which do not exist even on paper.
(2) 'Narmada Sagar, as conceived so far... is oversized and has adverse environmental influences disproportionate to benefits derived from it'—A very very senior planner.
(3) The 75 per cent dependable run off of the river was overestimated by the Tribunal at 27.2 MAF. It is now placed at 23 MAF—thus the projects were planned with overestimated run off.
(4) The Narmada Sagar dam has been planned without considering the effect (in reducing the water availability) of the dams to be, and already constructed upstream (Tawa, Bargi, Barna and others).
(5) Many critical studies and plans for Sardar Sarovar are still incomplete (or even to be started)—Command Area Development Plan, Compensatory Afforestation Plan, Rehabilitation Masterplan, Catchment Area Treatment Plan, Problems of Salt Water Ingress and so on.
(6) The silt load, which has a direct effect on the life of the dam, has been underestimated at design at 1.55 ha-m/100 sq km instead of the actual observed 5.62 ha-m/100 sq km.
(7) In the cost benefit calculations, the costs of forests submerged have been considered at Rs 15 to Rs 55 per year per hectare! And the life of forests had been assumed at 50 years.
(8) As per the environmental clearance given to the two dams, an important guideline is that the compensatory and penal afforestation should be done in the project impact area. Yet, the compensatory afforestation for Sardar Sarovar is being done in Kutch!
(9) The survival rate for these kind of plantations is not more than 10 per cent. This means that if we really want to compensate the loss of forests, we must plant an area at least 10 times the area submerged—A senior forest official concerned with the project.

These are only examples of the kind of information that the planners have with them. Is it any wonder then that they are 'disinclined' to reveal it? All the above data has been of course obtained from reliable sources.

We have time and again called for a public debate of the kind that BDD talks about; in fact, at least three times have we sent direct invitations to the Sardar Sarovar authorities and have called them for a public debate. However, there has not been even an acknowledgement from them about this. In one of the letters written to Sanat Mehta, he has answered all the other points of the letter but has conveniently forgotten even to mention anything about the invitation for a public debate. Thus, it is very clear why the planners don't want to speak out, as also what the results would be if they do.

BDD then goes on to some of the issues raised by the critics of these projects. Here also, it is apparent that he starts out with a bias towards the irrigation planners and, in trying to answer the objections of the critics, often contradicts himself. Let us look at the issues raised by him.

Environmental Angle

(i) BDD quotes a knowledgeable source as saying that dams have been responsible for only 5 per cent of the total forest loss since independence. Fair enough. But just because we are unable to control the other 95 per cent of the forest loss does not mean that we should go ahead with this 5 per cent. More importantly, it is necessary to understand that these kinds of dams are an integral part of a development process which is responsible for this 95 per cent of forest loss. And the critics who are objecting these dams are at a more fundamental level also questioning this very process. BDD sadly fails to understand this, and thus can advocate a reduction in the height of the dam as a solution! This of course does not in any way answer the fundamental issues raised by the critics.

(ii) About waterlogging and salinity, BDD first accepts that these are serious problems created by canal irrigation, but then immediately adds that the statistics quoted in this regard are of questionable magnitude and relevance.

One wonders whether BDD would find the following 'of questionable magnitude and relevance'—"out of a total of 42 m ha of area under irrigation, at least 10 m ha is affected by waterlogging and salinity". The source is *Government of India Guidelines for Environmental Impact Assessment of River Valley Projects.*

BDD then talks about proper drainage being le to effectively tackle this problem, but at nat cost he does not say. He also tries to say at in arid regions drip and sprinkler irriga-on would be the ideal way of containing sali-ty, but in the footnote says that this cannot used for all crops, and in any case is too pensive.

eismic Angle

BDD says that this is an issue that can be est resolved by geologists and seismologists. obody denies this. In fact, a lot of geologists emselves are raising this issue. As far as the itics are concerned, they have the full right quote the arguments of the experts to sup-ort their case (as earlier in the article BDD uotes his knowledgeable dam builder). To uote only one such example—from a note repared by the National Geophysical Research nstitute, Hyderabad—"the probability of more requent earthquakes of smaller magnitudes compared to 6-6.5) being triggered of by it Narmada Sagar) would be fairly high".

Rehabilitation Of Dam Oustees

It is very revealing that BDD gives the least mount of space to one of the most vital issues. n fact, though the large scale involuntary displacement of people, especially tribals is by tself a sufficient reason to stop building these kinds of dams, BDD does not make any com-ment on this aspect except to say that this human question is now worrying many a sen-sitive soul. That surely is an understatement. n fact, many people, including experts, engineers, social scientists, administrators, an-thropologists, concerned citizens, are now com-ng to the conclusion that proper rehabilitation of such large number of people is just impossi-ble, and these kinds of projects need to be stop-ped. It is obvious that these kinds of projects are planned and executed by people who have never been displaced in their lives, and who have seen the process of displacement and rehabilitation from behind the safety of their air conditioned offices and their red tape bound files.

Other Critics

It is in this section that the very casual and condescending attitude of BDD towards the critics is fully exposed. His use of words like 'sundry groups', 'some are sore' and 'motley group' betray his lack of grasp of the serious-ness of the issues raised by these critics. He talks about the need to 'rectify the imbalance of resource allocation (to large dams)' but 'does not warrant an abandonment of these schemes altogether'.

One wonders whether BDD has the idea of the magnitude of this resource imbalance. "At the beginning of the 7th Plan, there were 181 major and 433 medium ongoing projects with a total spillover of cost of Rs 26,000 crore. The strategy for the major and medium irrigation sector for the 7th Plan is based on prioritisa-tion of projects with adequate funding for com-pletion of projects which are in advanced stage of implementation..." (Annual Report of the Ministry of Water Resources). This is fair enough, but then why push ahead with the Nar-mada Valley Project, only two dams of which are expected to cost about Rs 20,000 crore.

BDD talks about a 'motley group sold on the idea of small is beautiful'. Does he realise that this motley group was led by none other than the Father of the Nation, Mahatma Gandhi, and included individuals like E F Schumacher whom the government of India had called in as a consultant to help plan the development of our country? It is unfortunate that the ideas of these men got lost in the glitter of 'modern' technology and model of development that we imported from the west.

BDD talks about the 'gaping holes' in the arguments in favour of minor schemes. We would, of course, welcome any irrigation engineer to come forward and put forth his/her viewpoint on the same, and expose any gaping holes. However, we are clear as to why the ir-rigation engineers and planners are keeping quiet. (We have already talked about these reasons earlier.) We challenge the planners to expose the gaping holes in the experiments at Ralegaon Shindi, Shukho Majri, Baliraja Dam on the Yerla and other such schemes.

It should be made clear here that the objec-tions to the large dams are not solely on technological grounds, but also on the more im-portant grounds of social justice, equity and the right of access to resources of the nation to all its citizens. There are two points that BDD makes again and again in his article. One is that the planners are silent as yet, and if they speak out, then many of the critics' arguments would come to naught. We have already talked about this, and to us it is clear that the planners are not speaking out because (a) they simply don't have convincing answers to the critics' argument (b) the vested interests and political pressure do not allow them to speak the truth, for we are convinced that this would only go to support the critics.

Secondly, BDD persistently calls for a reduc-tion in the height of the dams, and implies that this is an effective answer to all the objections raised by the critics. However, it is important to note that those of us who are today oppos-ing the Sardar Sarovar and Narmada Sagar, are doing so on certain very fundamental and basic issues, which simply cannot be satisfied by a lowering of the height of the dam. Can BDD tell us how the lowering of the dam height would fundamentally answer the questions of social injustice in terms of distribution of resources, lack of people's participation and their alienation from the development process of the nation, control and management of the resources by and for the elite few, environmental destruction, involuntary displacement on a large-scale, lack of critical, objective studies by the planning agencies, and a decision-making process in which decisions are based on vested political interests rather than on socio-techno-economic grounds?

Today, the opposition to big dams is aimed at exposing this kind of institutionalised, faulty developmental process which is inherently un-just, and is leading to the destruction of the very resource base on which the survival of mankind is dependent. What we need today is a judicious (water) resource management policy that is technically sound, economically feasible, environmentally sustainable and above all, socially just.

Managing Dissent in North-East

The government of India's policy towards minorities in the north-east has had some significant positive results. The successful political incorporation of dissenting minority groups by giving them significant levels of political autonomy and a major say in determining public policy is an important part of the government's record in the north-east. 2087

States' Taxable Capacities

A critical examination of the methodology adopted by the Ninth Finance Commission to measure the relative taxable capacities of the states. 2077, 2080

Exposing Political Puerility

A dissection of the much bruited panchayat and nagarapalika bills against the background of the claims being made by the government. 2051

Democratising the Terms of Discourse

Terms of discourse fashioned under colonial control nurtured intellectuals incapable of comprehending their own history and culture. An analysis of the continuity and consolidation of these terms in the post-colonial period and the structures of power underlying the prevailing framework of knowledge. 2069

Algebra as Cultural Metaphor

The nineteenth century Indian mathematician Ramchandra's treatise on the problems of maxima and minima, when placed against the background of his stance *vis-a-vis* the colonial education policy, clearly reveals the beginnings of a still nebulous anti-colonial politics. 2082

BOP Strains

The current account deficit in India's external payments has widened quite sharply. What does this reflect? An analysis. 2056

Bullets for Rice

Never before in the history of Tripura has such a cold-blooded murder of men and women taken place for the 'crime' of asking for more food. 2055

Regulating Biotechnology

A competent assessment of the long-term impact and potential risks to health and safety of biotechnology products is urgently needed. Some suggestions for building an adequate regulatory machinery. 2061

Collusion with Capital

Owners and unions sometimes collude to liquidate 'sick' industrial units, leaving the workers in the lurch. 2059

Harmful Drugs

Despite the ban on certain categories of drugs the affected companies have obtained stay orders from the high courts and continue to market the drugs. The launching of a boycott programme by the All-India Drug Action Network. 2057

For the Cynics

The cynics are full of Tiananmen Square but Tiananmen Square does not constitute history which takes a longer view of heroes and traitors. 2049

Is Chinese socialism not prepared to grant even bourgeois democratic rights and/or the right to have non-party people's organisations? 2066

Oilseeds Economy

If one considers the various facets of the oilseeds economy like production, imports, prices and excise rebate on use of minor oils, a curious scenario emerges with the progress of the current season. 2042

Potentially Disastrous

THE reported decision of the Maharashtra government to utilise 2500 hectares of forest land in Dhule district for rehabilitating the oustees of the Narmada Project will be disastrous from the environmental point of view. If the application made by the Maharashtra government to utilise forest land for rehabilitation is approved by the ministry of environment and forests, it will establish a very harmful precedent, and it will be almost impossible to reject future demands made by other state governments for the same purpose. Since the total land requirement for rehabilitating the Narmada oustees amounts to more than 1,00,000 hectares, it would result in the loss of this very large area of irreplaceable natural forests, in addition to the 40,000 hectares of forest land that are likely to be actually submerged by the two dams.

What is most shocking about the Maharashtra government's decision is the fact that there is no shortage of non-forest land. In fact, more than 6,200 hectares of revenue land have already been identified by the Maharashtra government for 'compensatory reafforestation', i e, to compensate for the forests that will be submerged by the Sardar Sarovar Project. Despite the fact that it is possible to rehabilitate the oustees of the Narmada Project on such land, the Maharashtra government has chosen to use forest land for rehabilitation. Probably, another equivalent area may then be identified for 'compensatory afforestation'.

Another surprising fact is that these 2,500 hectares of land in Dhulia district contain more than 5,00,000 standing trees of indigenous varieties as well as a wide range of bird and animal life that cannot, by any stretch of imagination, be replaced by 'compensatory afforestation'. What is most amazing perhaps is the fact that this 2500 hectares of land that is sought to be deforested forms part of the catchment area of the Ukai dam on the Tapti River. Any deforestation of the catchment area of the Ukai dam will inevitably lead to an increase in the siltation of this dam. Perhaps both the Gujarat and the Maharashtra governments are now only concerned about the Narmada and the Ukai dam has ceased to be of importance!

From the environmental point of view, it would be of paramount importance that the ministry of environment and forests, be able to successfully continue to resist the pressures that it has been subjected to in this case.

Civil Liberties and People

A P VITTAL's letter (*EPW*, July 15) exposes not Balagopal's extremist bias but his own limitation in understanding the concept of civil liberties. Being affiliated to a 'political party other than extremists', it was *he* who could not hide his antipathy. Besides, he is not the judge to decide whether Balagopal's organisation has credibility or not.

Vittal has asked 'responsible leaders like Balagopal' to 'ponder over' the issue as to how such a situation (180 people getting killed by the police in AP) has come about, but he does not seem to have pondered over it himself. If he did, he would have realised that it is the government which has been systematically suppressing in a most brutal fashion, the democratic legal struggles being waged by the peasants and tribals of Telangana and other areas under the leadership of these so-called extremists since 1978. Interestingly, even the ruling party functionaries in the region openly deplored the atrocities being committed by the police.

Without exception, every citizen of this world needs civil liberties irrespective of the 'goodness' of a person—a subjective term that is hardly a criterion to determine the eligibility to have civil liberties. It is precisely this point that is sought to be proved by PWG; it is not just Malhar Rao and Chenchuramaiah who need civil liberties but also the ill-fated Ilaiah and Rajamallu and the six harijans of Karamchedu who perished in the carnage led by Chenchuramaiah. It is quite presumptuous on the part of Vittal to equate himself and his colleagues with the whole 'people' who 'justifiably' became indifferent to false encounters. Vittal has never been different. As he himself states, there can be no two sets of civil liberties.

Hyderabad — RAJ KUMAR

A Matter of Conviction

I WAS shocked to read a very objectionable reference to me in an article by Rakhahari Chatterji ('Democracy and the Opposition in India', *EPW*, April 23, 1988). The author refers to my "zeal to please the powers that be" and my "even forgetting to use decent language in describing opposition activity". I challenge Rakhahari Chatterji to prove my recourse to indecent language in regard to the opposition with a direct quote from the paper of mine he has referred to. So far as my "zeal to please the powers to be" is concerned, my colleagues and students who know me better can testify that I have been made to suffer by the "powers that be" in the course of the last eight years that have been a nightmare to me. I hardly know Chatterji, but I would welcome it if he can show a single instance of favour to me by the government at the centre or that in Bihar from where I come. Whatever I write as a political scientist, or for that matter teach in the class-room, are a matter of conviction—liberal conviction—with me.

Delhi — M P SINGH

ECONOMIC AND POLITICAL WEEKLY

Red Herring of Fiscal Deficit

THE annual report of the Reserve Bank of India, released last week, reviews developments in the major sectors of the economy, but it is the central bank's assessment of the monetary and credit situation which naturally calls for the closest attention. Here, it may appear, the bank has been relatively frank. Monetary expansion in 1988-89, it is admitted, at Rs 28,571 crore (17.6 per cent) was substantially larger than in 1987-88 (Rs 22,027 or 15.7 per cent). The rate of monetary expansion, it is also suggested, was higher than what was warranted even by the extraordinary near-10 per cent growth in real GDP in 1988-89 (the result largely of a 23 per cent rise in agricultural production after the decline of the preceding two years) and could thus be taken to have contributed to the robust pace of inflation during the year (7.5 per cent as measured by the wholesale price index and 9 per cent by the consumer price index).

For many years now the burden of the Reserve Bank's song in any discussion of monetary developments has been how in regulating the expansion of liquidity in the economy its hands have been more or less tied by the government's large and growing budgetary deficits. This performance is repeated in the latest annual report. The anxiety to keep the focus on the fiscal deficit has, it must be admitted, led to the chapter on 'Government Finances' being among the best in the report. The discussion of and the data on trends in government finances, the persistent revenue deficits and the contributory factors, the outpacing of development expenditure by non-development expenditure and of direct tax receipts by indirect tax receipts and so on are indeed illuminating. Most interesting of all are the data, presented for the first time, on the fortnightly levels of the centre's budgetary deficit and net RBI credit to the central government. Compared to the contrived year-end figure of budgetary deficit of Rs 5,810 crore in 1988-89 and net RBI credit to the government of Rs 6,503 crore, the average for the financial year as worked out in the annual report was Rs 8,114 crore for the former and Rs 7,309 crore for the latter. The central budget for the current financial year anticipates a deficit of Rs 7,337 crore, but the actual deficit had already exceeded the budgeted amount by the beginning of June.

However, conceding the undoubted relevance of these data, it is time the view propagated by the Reserve Bank on the central role of the fiscal deficit in fomenting monetary expansion in the economy was questioned. Before that it may be pointed out in passing that the Reserve Bank's claim that the secondary expansion in liquidity emanating from the large increase in reserve money generated by the fiscal deficit "was moderated by raising the cash reserve requirements" is largely baseless and is in fact contradicted in the very next paragraph of the annual report where it is admitted that "the unadjusted incremental money-multiplier [increase in money supply divided by increase in reserve money] ... showed a noticeable rise in 1988-89 over the levels in 1987-88". One conspicuous effect of the progressive hiking up of the cash reserve ratio to its current level of 15 per cent has been to send interest rates in the call money market soaring to 30 per cent and even higher from time to time, compelling the Reserve Bank to pump in even more liquidity into the system. (The peak level of refinance from the Reserve Bank utilised by the Discount and Finance House of India in 1988-89 was as high as Rs 902 crore.)

To turn to the substantive issue, the data on the sources of monetary expansion clearly show that in 1988-89 the predominant role in such expansion was the non-government sector's and not the government's. Thus whereas net bank credit, including RBI credit, to the government expanded by Rs 12,715 crore (15.1 per cent), bank credit to the commercial sector soared by Rs 20,531 crore (19.5 per cent). If allowance is made for the decline of more than Rs 1,400 crore in food credit during the year, the disparity between the relative shares of the government and the commercial sector will be seen to have been even wider. There is in addition the expansion of Rs 1,452 crore in bills rediscounted by scheduled commercial banks with other financial institutions which too is a part of bank credit to the commercial sector. If the Reserve Bank has any clues as to why such a massive expansion in bank credit to the non-government sector should have taken place in 1988-89, it does not reveal them, beyond the limp assertion that it was "to some extent" attributable to "higher production and investment activities".

What is also striking is the Reserve Bank's unconcern about the other vital dimensions to the expansion of liquidity than its—by no means convincingly established, as the recent experience of the Indian economy itself shows—link with price levels and inflation. How financial resources are apportioned out from one period to another determines the pattern of control over real resources. Therefore, as important as the size of the overall monetary expansion in 1988-89 is that gross scheduled bank credit appropriated by large and medium industry during the year nearly doubled from Rs 3,797 crore in 1987-88 to Rs 7,005 crore. Large and medium industry's share of total non-food credit expansion in the respective years rose from 35.8 per cent to 41.6 per cent, whereas the share of small industries at Rs 2,307 crore in 1988-89 showed a decline to 11.5 per cent from 13.6 per cent in the preceding year. To get a fuller picture of the financial resources appropriated by large industry, account has to be taken also of the sharp rise in capital issues and in the sanctions and disbursements of the all-India term-lending institutions. Non-government public limited companies raised Rs 3,117 crore through public issues in 1988-89 compared to Rs 1,774 crore in the previous year, the increase being largely attributable to a few large debenture issues. That this trend is going to gain further momentum is evident from the steep rise in consents for capital issues granted by the CCI from Rs 5,278 crore in 1987-88 to Rs 8,029 crore in 1988-89, with the consents for debenture issues going up from Rs 3,737 crore to Rs 6,585 crore. Similarly, assistance sanctioned by the all-India financial institutions at Rs 13,913 crore in 1988-89 showed a rise of 56.9 per cent over the previous year and assistance disbursed was 34.8 per cent larger at Rs 8,526 crore. The point, briefly, is that the monetary authority has to take a comprehensive view of the flow of financial resources from different sources. Once that is done, the sharp tilt in the working of the monetary and financial system in favour of the most powerful and the most privileged segments of the economy stands out bold and clear. Given their appetite for funds, even if by some miracle the government's budgetary deficit were to be wiped out, the monetary authority would have to inject equivalent liquidity into the system through other channels. However, the Reserve Bank of India's rigidly monetarist gaze remains unwaveringly fixed on the fiscal deficit.

'Communication Gaps'

THE central policy of blowing hot and cold towards the Left Front governments of Kerala and West Bengal seems to have stumped second-ranking Congress(I) leaders and ranks who, often not knowing which way the central wind is blowing, tend to commit *faux pas* and become the laughing stock.

A junior member of the union council of ministers, M M Jacob, presumably pressurised by Congress(I) ranks in Kerala, exploded the other day threatening use of Article 356 of the Constitution to oust the Left Front government there. More responsible colleagues of his in the party soon realised that such a threat, on the eve of the elections, was likely to be exploited by the opposition in its anti-centre campaign. The Congress(I) leader of Kerala, K Karunakaran, soon came out with a statement saying that his party would not seek centre's help to oust the Left Front, but would organise movements to achieve that end.

In West Bengal, the state Congress(I), already faction-ridden, has made an ass of itself over the demand for central intervention raised by some of the impudent blusterers who dominate the West Bengal Pradesh Congress(I) Committee. While two junior union ministers from West Bengal, Priya Ranjan Das Munshi and Ajit Panja, have been clamouring for president's rule in West Bengal, the president of the WBPCC(I), A B A Ghani Khan Chowdhury, suddenly last week lambasted those demanding presidential rule, stating that the latter did not understand the problems of his state. Chowdhury is known to be closer than his other West Bengal party colleagues to the constantly changing barometer of Rajiv Gandhi's domestic politics. After blustering against their own leader, Chowdhury, accusing him of sabotaging Congress(I) efforts to dislodge the Left Front, the WBPCC(I) is now retracting. At its last meeting, which was supposed to express no-confidence in Chowdhury, the WBPCC(I) finally came out with the lame plea that it did not officially demand central intervention but simply pointed out that since the state had violated its constitutional responsibilities and failed to maintain law and order, there were sufficient grounds for central intervention. The retraction suggests that the hot-headed youngsters of the state unit had been ticked off by the seniors in New Delhi. Explaining the retraction, a WBPCC(I) spokesman was reported to have stated that there was a 'communication gap' between the state unit and its president, Chowdhury!

The immediate provocation for the Congress(I) demand for central intervention in Kerala and West Bengal has been provided by the CPI(M), which also seems to have drawn into its fold a host of braggarts as its second-ranking leaders and musclemen as its ranks. Devoid of any ideological commitment, and attracted by positions of power and guarantee of protection by the government, these political parvenus behave in the same way as the new generation of Congress(I) politicians and cadres in the Congress(I)-ruled states. In Kerala, they have been embroiled in clashes with CPI and RSS cadres for quite a long time, and could get away with it as long as they did not touch the Congress(I). But recently they beat up activists of the Congress(I)-led Kerala Students' Union—a miscalculation on the part of the CPI(M), which indicates the 'communication gap' between the party's central leadership and the state leaders, between the state leaders and their musclemen, a curious parallel to the 'communication gap' between the Congress(I) top brass and those at the bottom, about which the WBPCC(I) spokesman complained. Realising that it had overstepped, the CPI(M) chief minister of Kerala has now ordered a judicial inquiry into the incident of the beating up of the Congress(I) students—in sharp contrast to its refusal to hold similar inquiries into the scores of incidents of assaults on other political activists in the state.

In West Bengal, the Congress(I) demand for central intervention was triggered off by the CPI(M) assault on the union minister, Priya Ranjan Das Munshi, in the course of a clash between the Congress(I) and the CPI(M) during a meeting near Calcutta. Das Munshi was hospitalised for his injuries—minor, as evident from his release from hospital soon after. But that was enough to provide the Congress(I) with a handle to demand the ouster of the Left Front government. Those in West Bengal who had to suffer during the Emergency the depradations of Das Munshi (who at that time as a Congress student leader was known to have led assaults on opposition party cadres), will not surely shed any tears for him, since he is probably being paid back in his own coin. But the CPI(M) leadership of the West Bengal Left Front should have restrained its cadres—many among whom are suspected to have been drawn to the party because of non-ideological motives like making good under state patronage—from beating up journalists during the Bharat Bandh. The CPI(M) veterans—in their own interests in survival in the parliamentary game—will have to pull up their juniors and cadres so that they do not go beyond the limits. It is a tight-rope walk for the CPI(M)—keeping the middle classes (the vocal section of the electorate, whether in Kerala or West Bengal) assured of security and keeping the Congress(I) at the centre assured of a guarantee that its activists and activities would not be harmed in the Left Front-ruled states. But how is it going to overcome the 'communication gap' between the party's central leadership and state leadership, between the state leadership and the cadres, and above all, between the party policies and the reality?

ANDHRA PRADESH

Suspicions Confirmed

CHILE, El Salvador, Philippines. And now, right here in Andhra Pradesh! The 'vigilantes' and 'death squads', exposed by international human rights organisations, have appeared as the Indian 'avatar' in the STF (Special Task Force).

The three-day drama involving the kidnapping of K Balagopal, general secretary of the Andhra Pradesh Civil Liberties Committee (APCLC), is by now well known to newspaper readers. The Andhra Pradesh home minister's denial and NTR's public posture of innocence notwithstanding, it is palpably clear that Balagopal was waylaid on the evening of August 28 on his way from Khammam to Hyderabad by members of the STF which, as a part of the Andhra Pradesh State Intelligence, was set up some five years ago to counter the CPI(ML)-led peasants' struggle in the northern and eastern parts of Andhra Pradesh. Masquerading under the populist name of 'Prajabandhu', the abductors told Balagopal that they were from the STF and added that they were acting under 'instructions from above' (a claim made probably under the influence of their self-assurance of capturing a 'trophy', but made in an unprofessionally inadvertent manner which should embarrass the instructor from 'above', NTR, if of course he has any sense of embarrassment).

But even if the STF swashbucklers had restrained their enthusiasm to gushingly disclose their identity to Balagopal, they had to give themselves away when, pretending to be 'Prajabandhu' (a name probably chosen under the impression that it could pass off as one of the acceptable voluntary organisations) they publicly laid down two conditions for Balagopal's release. The first condition was that the two police constables, earlier abducted by

the People's War Group, must be released. The second was that no habeas corpus petition should be filed before the courts. Both the demands clearly identified their interests with those of the police. They did not even bother to maintain the pretence, when they straightaway took Balagopal to the police guest house at Khammam.

Balagopal's abduction received widespread publicity and drew prompt intervention by leaders of the National Front (some among whom pressurised NTR to get him released). But there are many others in Andhra Pradesh who still remain 'missing' and are suspected to have been either killed or held in custody by the STF. The STF, it is widely known, functions under chief minister N T Rama Rao. Moving in plain clothes, carrying sophisticated weapons and travelling in government jeeps (without police name-plates), STF personnel pick up young men and women suspected of Naxalite activities, take them to nearby police or forest guest houses and torture them. Sometimes, after they are reported 'missing', their mutilated corpses turn up at odd places. In May 1988, Meghyam, a young political activist was picked up by people suspected to be STF personnel in Mustyalapalli, Warangal. A few days later, his body was found hanging from the power transformer at the main crossing of Warangal. The body was kept hanging for the entire day by the police—as a show of exemplary punishment in the tradition of the Ku Klux Klan.

The suspicion that a clandestine outfit like the STF is in operation has been in the air for quite some time. Balagopal's abduction and the disclosure of the identity of the abductors now confirm the suspicion. While it is almost an axiom now that the legitimacy of established institutions is bound to get eroded under the Congress(I) regime, events in Andhra Pradesh prove that such erosion is no longer confined to Congress(I) states. A report brought out recently by the Delhi-based civil liberties organisation, PUDR, records that in the 308 weeks that NTR has been in power (from January 1983 to May 1989, excluding the four week interregnum when he was ousted), 395 people were killed and 27 still remain missing as a result of the depradations of NTR's police. The latest incident of Balagopal's abduction indicates that NTR has allowed the institutionalisation of a clandestine armed group which is not accountable to any administrative wing, law or constitution but only to one individual. An individual who gives consent to such operations and yet hopes to lead a national front to replace the Congress(I) at the centre owes an explanation to the public. The National Front leaders must press upon him to make a clean breast of his role in the ongoing police atrocities in Andhra Pradesh and to punish the guilty police personnel—if not for anything else, for the sheer need for the opposition to establish its credibility with the voters in the coming elections.

DEFENCE DEALS

Lurid Light

INDIA TODAY'S interviews with General Sundarji and with Lt-Gen H Kaul, who was deputy chief of army staff between 1983 and 1985, are noteworthy also for the lurid light they throw on the prevailing mores and morality in regard to the government's purchases of defence equipment. Sundarji mentions two instances in the process of selecting the 155 mm gun itself. In the first case, he reveals how at one stage the assessment of the four alternative makes of guns was sought to be skewed in such a way that the French gun would come out on top—"it was being tailored to become a one-horse race". The second case refers to the high-powered technical evaluation committee headed by Lt-Gen Mayadas which, Sundarji is convinced, had been set up "with the sole intention of pushing the Austrian gun".

The instance quoted by Lt-Gen Kaul is, of course, much more blatant: one of the contenders for the guns contract sent an intermediary who offered Kaul "Rs 2.5 crore in any currency or bunch of currencies anywhere in the world, in return for a favourable recommendation for their gun". Not only that, the intermediary told Kaul that the company he was representing knew the details of the top secret recommendations Kaul had made to the defence ministry. Kaul complained to the defence secretary disclosing the details of the bribery attempt. But did the government take any action? "Not that I know of", says Kaul and this is now borne out by the statement issued by S K Bhatnagar, then defence secretary and now governor of Sikkim. Bhatnagar's response to Kaul's allegation seems to have been quite remarkable. Like a typical bureaucrat he says he asked Kaul "for a detailed written report" and since, according to him, Kaul "was not forthcoming with the necessary information" he did not evidently spare the matter a second thought.

Sundarji has claimed in his interview that though under-the-counter payments may have been made, the choice of the Bofors gun itself was technically unimpeachable. If so, this must have been something of an exception—given the state of affairs in regard to defence purchases he and Kaul have themselves so graphically described.

WEST BENGAL

Dangerous Trend

THE spate of inter-party violence that has been vitiating the civic climate of West Bengal for quite some time reached its peak with the large-scale disturbance at Beliaghata, a lower middle class area in eastern Calcutta, on August 31, that is, the day after the Bharat bandh. According to *The Statesman*, not generally regarded as a calumniator of the Left Front or the CPI(M), "more than 500 armed CPI(M) supporters resorted to 'sheer vandalism with brazen impudency', as a senior police official described it, for about three hours". About 20 houses, including a few factories and business establishments were plundered. At least 30 people, including a six year old boy, were seriously injured. Two pregnant women were kicked on the abdomen by the CPI(M) men, according to the reports. Subsequently, some CPI(M) spokespersons have tried to palm off these outrages as the doings of some 'anti-socials', which of course is true provided it is added that some of them were under the CPI(M)'s protective wings.

Referring to the Beliaghata incidents and the assault on the union minister of state for commerce, P R Das Munshi, which had taken place earlier on August 27 at a small suburban town, a CPI(M) junior minister in West Bengal is reported to have told a closed door party meeting that these incidents had helped the Congress(I) regain lost ground. Whether the Congress(I) has registered any direct gains may still be questionable, but there is no doubt that the CPI(M) has lost some, notwithstanding the fact that in many, if not most, cases the provocation may have come from the Congress(I).

These incidents came in the wake of a long-drawn violent confrontation between the CPI(M) and the Congress(I) over the control of a major red light area in the city centre in which pimps and toughs were mobilised on both sides. All the while reports of violence continued to come in from the districts as well, in which in most cases the CPI(M) was one of the parties. To cap it all, there were some cases of violence or its threat against various media men—including TV personnel—which have evoked sharp condemnation by a number of journalists' forums.

While newspapers and commentators with an anti-CPI(M) bias have no hesitation in condemning the party's conduct as fascist vandalism, there are few people outside the party's still very wide fold who are prepared to condone the party's role—not only the particular instances of depredations, but also, and even more so, the CPI(M) leadership's pettifogging attempts at evading the party's responsibility in these dastardly actions, not to mention its failure to condemn them in an outright manner.

To any sympathiser or supporter of the Left with any of political sense it is clear that the CPI(M) is fast squandering away the enormous popular goodwill it had earned by and for ridding the state of mindless and senseless violence in the name of politics. Is the CPI(M) really seized with a death wish? Doesn't it realise the vast stake of its own as well as of the country as a whole that are today involved with its conduct? Jyoti Basu, pragmatist par excellence that he is, seems to have realised the danger to his government posed by the recent developments. But these are symptoms of a deep malaise. Mere sermonising or directives from the top may not work.

BUSINESS

VEGETABLE OILS

Many Question Marks

IF one pieces together press reports relating to the various facets of the oilseeds economy—production, imports, prices and excise rebate on the use of minor oils—the scenario that emerges provides a good illustration of confusion getting worse confounded with the progress of the season (October-September). Take first production which constitutes the most crucial element of the scenario and is the key factor influencing the formulation of various policy inputs for the efficient management of the vegetable oils economy.

By about the middle of March, the official estimate of oilseeds production (nine cultivated oilseeds) in 1988-89 had been revised to 156 lakh tonnes against the initial estimate of 145-155 lakh tonnes. A few weeks later, the union food and civil supplies minister, Sukh Ram, stated at the Ahmedabad seminar on rabi oilseeds on April 9 that "a record oilseeds harvest of 160 lakh tonnes may be achieved". On July 20, NDDB chief Kurien stated at a press conference in Bombay that the country expected a record production of 165 lakh tonnes of oilseeds during the current year. And on August 29, the union agriculture minister Bhajan Lal stated at a meeting of the National Oilseeds and Vegetable Oil Development (NOVOD) Board in New Delhi that "aided by monsoon, the output in 1988-89 went up to 178 lakh tonnes which crossed the previous record by 37 per cent".

Revision of crop estimates till the harvest is ready is a normal feature of agricultural statistics even in advanced economies where the crop information system is highly sophisticated. But any significant revision of production figures after the crop has been harvested is a rare phenomenon. The upward revision of oilseeds production figures by the agriculture ministry (from 160 lakh tonnes in April to 178 lakh tonnes in August) calls for some really convincing explanation to command credibility. In any case, such revision so very late in the season reflects poorly on the government's crop information system. The main point that is sought to be made is that it is simply not possible to evolve any meaningful policy inputs if one does not have a proper estimate of indigenous supply.

To complete the supply side, let us have a brief look at reports about edible oil imports. On July 20, the NDDB chief told newsmen in Bombay that the record production of 165 lakh tonnes this season had enabled the country to bring down substantially oil imports to around 3 lakh tonnes from 18 lakh tonnes last year and that as the market intervention agency NDDB had permission to import 1.5 lakh tonnes of edible oils but there appeared to be no need for any import at present. The very next day, the minister of state for commerce, Priya Ranjan Das Munshi, stated in the Lok Sabha that in view of the bumper oilseeds production, the government had ruled out imports of edible oils this year and that it will also not release the 1.56 lakh tonnes of imported edible oils lying in its stocks so that oilseeds prices do not get depressed and growers are not denied remunerative prices. Unless it is a case of gross misreporting, the minister also referred to the fact that bumper oilseeds production had already led to a cut in oil imports from a projected level of 2.3 million tonnes to an actual import of 8,50,000 tonnes only in 1988-89.

On August 19, a New Delhi report stated that India would import one lakh tonnes of edible oils by September-end and that the STC had already negotiated deals for this quantity with Indonesia, Czechoslovakia, Malaysia and Rotterdam. Quoting the Indian commerce minister Dinesh Singh, a report from Kuala Lumpur dated September 1 stated that the STC had been empowered to import 2,00,000 tonnes of vegetable oils for the rest of this year and that India would look into the possibility of securing Malaysian palm oil. Taking an overall view of reports about indigenous production and imports, it is difficult to make any really worthwhile assessment of total supply to properly evaluate the supply-demand equation.

Another issue which has evoked animated discussion is that of the upsurge in groundnut oil prices in the context of sizeable stocks acquired by the NDDB in the course of its procurement operations carried out as a market intervention agency. About the middle of August, the Federation of Gujarat State Edible Oil Merchants' Association—Gujarat is a major producer of groundnut—urged the union civil supplies minister to ask the NDDB to release groundnut oil from its buffer stock of 4.25 lakh tonnes of mustardseed/groundnut oil with a view to check the 'unreasonable and unwarranted' price rise and ensure supply of edible oil to the public in the ensuing festival season at a reasonable price. Some two weeks later, the NDDB and the Bombay Oilseeds and Oil Exchange got locked up in an unseemly controversy over the price issue.

Much of the criticism to which the NDDB has been exposed betrays a lack of proper perception of the role assigned to it under the integrated policy for oilseeds. For, as long as the prices of the two designated oils keep within the stipulated price bands—Rs 20,000/Rs 25,000 a tonne (wholesale) for groundnut oil and Rs 17,000/Rs 23,000 for rape-mustard oil—there is no sound reason why anyone should question the marketing strategy NDDB pursues to make the most of its commercial operations.

And once the champions of the consumers' cause have accepted the upper limit of the price band as fair and reasonable, they can have no legitimate cause to complain against the NDDB as long as prices keep within the upper limit. NDDB cannot be held responsible for the exploitation of the consumer by the retail trade. Going by market reports, only on two days towards the end of the third week of August did the wholesale price of groundnut oil cross the Rs 25,000 a tonne mark and that also for a short while.

Consumers, of course, have reason to feel concerned over the sharp rise in edible oil prices since about the end of July. Compared with the prices which prevailed a year ago, groundnut oil is costlier by about 20 per cent, sesame oil by 29 per cent, cottonseed oil by 16.5 per cent, rapeseed oil by 12 per cent and soybean oil by 11.5 per cent. Indeed, viewed in the

context of the latest oilseeds production estimate of 178 lakh tonnes and reasonably reassuring prospects for the 1989-90 crops, the steep rise in edible oil prices appears rather intriguing. But price movements cannot be always satisfactorily explained because of the subtle interplay of several tangible and intangible factors which often defy analysis.

Last comes the government's important policy decision withdrawing the excise incentive scheme for the use of minor oils in the manufacture of vanaspati and soaps with effect from August 25. The decision is welcome but certainly not for the reason advanced by the government. For the official release simply says that after reviewing the relevance of the scheme in the context of the present edible oils production levels and the levels of usage of these minor oils already achieved in the manufacture of soap and vanaspati it was no longer found necessary to continue the scheme. The statement is not only too vague to lend itself to any precise interpretation, but it gives the altogether erroneous impression as if the scheme has achieved the objective of bringing about the desired increase in the production of rebatable oils.

There exists a huge gap between the potential and actual supply of rebatable oils; estimates of the gap vary from 13 to 17 lakh tonnes. Despite fiscal incentives for the use of selected oils in the manufacture of soaps and vanaspati, hardly 50 per cent of the realisable potential has been exploited. To mention only two instances, the rice milling industry alone can contribute up to 7 lakh tonnes of rice bran oil whereas current production is barely around three lakh tonnes. The present level of cotton production has the potential to yield about 6 lakh tonnes of cottonseed oil but actual production is less than three lakh tonnes.

The withdrawal of the excise rebate scheme is to be greatly welcomed because the scheme had not been properly conceived and in any case it had ceased to serve the purpose for which it had been originally conceived in March 1986. There has been only a marginal increase in the production of rebatable oils after 1987-88. With the availability of rebatable oils exceeding the maximum use under the permissible rebate of Rs 1,000 a tonne in respect of vanaspati, the scheme had lost its relevance. Besides, the different rates of rebate for different oils led to all kinds of malpractices.

While production of rebatable oils virtually stayed put, the vanaspati industry came to accumulate credit of about Rs 100 crore in its books which had been allowed to be used after a lock-in period of one month. The point had been reached where a vanaspati unit, whether it used the rebatable oil or not, continued to get the rebate of Rs 1,000 a tonne of vanaspati cleared from the factory against debit to the 'earned rebate'. Not only that. With the excise duty rebate of Rs 1,000, the effective rate of duty on vanaspati came down to Rs 900 a tonne thereby giving it a distinct competitive edge over refined groundnut oil which carried a duty of Rs 1,500 a tonne.

The vanaspati industry had all along been the major beneficiary of the excise incentive scheme. One does not therefore expect the vanaspati industry as also the producers of rebatable oils to take kindly to the withdrawal of the scheme. The industry has been quick to point out that the withdrawal of the rebate will push up its cost of production by Rs 1,000 a tonne. But what about the subsequent rise in vanaspati prices and the decline in the prices of minor oils? One would not be the least surprised if some of the leading vanaspati manufacturers resort to legal action against the government's decision wiping out the credit lying in their books by way of accumulated rebate. The government will have only itself to blame if it finds itself in the embarrassing position to defend its apparently weak case.

Despite the spectacular increase in oilseeds production in 1988-89 and reassuring prospects of good crops in 1989-90, the need for fuller exploitation of the existing oil bearing resources is not any the less imperative. In order to promote larger usage of rebatable oils, the government could have increased the quantum of excise duty relief and/or reduced the rates of rebate. That the government should have decided to abandon the scheme instead, suggests that it has belatedly realised the conceptual weaknesses in the scheme.

Now that the excise incentive scheme for the use of minor oils has been discontinued, the government will need to do serious rethinking on fresh measures aimed at encouraging the production and usage of minor and unconventional oils. The present level of production can be easily maintained simply by incorporating the minimum use of the hitherto rebatable oils in the manufacture of vanaspati. Such a scheme existed in the past in respect of the usage of cottonseed oil in the manufacture of vanaspati. Offer of direct assistance to producers of solvant extracted oils linked to increased quantity of oil produced would help augment supply. Hikes in incentives for exports of deoiled meals of minor and unconventional oilseeds, hitherto covered by the rebate system, could also prove helpful. It is much better to link incentives to production instead of usage of minor oils.

TWENTY YEARS AGO

EPW, September 13, 1969

Speculation about the nature of future leadership of North Vietnam is understandably rife. The 26-member panel which has been set up can only be a stopgap arrangement. At the same time it seems fairly certain that a collective leadership will emerge in Hanoi. No one man can fill the vacuum left by Ho Chi Minh's death. Most analyses of the Vietnamese political scene appear to be based on the assumption that there are pro-Moscow factions within the ruling Lao Dong (Workers') Party. Naturally the effort is to find out which faction would ultimately prevail and what would be its policies. . . The more relevant question, therefore, is whether Ho's death would mean any change in the North Vietnamese position at the Paris talks. There seems little reason to think that there will be any change. . . This is not to suggest that the Vietnamese leadership is of one mind on all issues. This is also not to suggest that the Sino-Soviet rivalry does not extend itself to the Lao Dong Party. It certainly does. What is suggested is that such differences as might exist among the Vietnamese leaders do not relate to the ultimate goals and the accent on unity which those goals demand.

★ ★ ★

Precious time has been lost since July 9 when the large commercial banks were nationalised. There is still no evidence of the outlines of reorientation of banking. . . The only step taken so far—if that can be called a step—is the creation of a department of banking in the ministry of finance. Its creation marks the reversal of the trend which had been initiated under TTK to hand over nearly all the powers relating to financial institutions to the Reserve Bank. Resumption of these powers by government. . . is a clear indication. . . of lack of confidence in the Reserve Bank's capacity to refurbish the banking system in tune with the objectives of nationalisation. . . The advantage of locating administrative control over all banking activity—including that of development banks—in New Delhi should lie in converting the banking mechanism into a useful adjunct to the budget. . . so that between them the budget and the banks become the principal instruments of Plan implementation. Direct controls through licensing, administrative checks and price fixation, etc, can then be downgraded, for taxes, expenditure and credit policy are much more effective in achieving the desired objectives. In other words, credit planning, not bank housekeeping, should be the main function of the banking department.

THE INDIAN SEAMLESS METAL TUBES LTD.,

Registered Office : 6 E, Ramabai Ambedkar Road, Pune 411 001.

CHAIRMAN'S STATEMENT

Shri J.G. Keswani, Chairman.

Dear Shareholders

Sustained Growth

You would be happy to note that your Company enters its next phase after recent expansion, by crossing the Rs. 50 crore mark in turnover. I am glad to inform you that the next coveted threshold, the Rs. 100 crore mark in turnover, is now reasonably within our reach in the next three years. What is more gratifying is that the Company is laying solid foundation for this envisaged growth with consummate skill in planning and dedicated hard work.

Difficult year – Successful Results

Now, about the year that is over. Though the overall results have been satisfactory, this was in fact a difficult year for the Company. The frequent steep increases in price of raw materials, the massive capital expenditure plans undertaken, the re-location of critical machinery in accordance with new lay-out to meet expansion requirements and the demands made on the technical team for technology absorption were some of the key areas where tremendous efforts have been put in by the employees to bring about the successful results placed before you. On behalf of my colleagues on the Board, on behalf of all of you and on my own behalf,I would like to congratulate each and every employee for his or her excellent work. I am confident that similar efforts will enable us in the coming years to overcome the difficulties that no doubt would arise.

Steel Project

I am very happy to report the most important development of the year viz. the grant of Letter of Intent by Government of India to the Company for setting up its own steel plant. With this, we now appear to have found a long term solution to the problem of availability of raw materials, at the right time and price and in right quality and quantity. The project is proposed to be located in a backward area of Maharashtra and would provide employment to about 300 workmen besides imparting vital impetus for regional development

Expansion and Diversification

The Company's expansion project has been completed according to plan and today it has perhaps the most diversified manufacturing range among the seamless tube makers in the country. The Company has applied for further enhancement of capacity from 30,000 tonnes to 50,000 tonnes a year. At the same time the Company has undertaken substantial capital expenditure programme as part of its commitment to continuous quality upgradation. The successful commissioning of Cold Pilger Mills without any assistance of Foreign Technicians was indeed a major technological achievement. The response from the customers to Cold Pilgered Tubes has as anticipated been very encouraging. Import substitution by the Company in the bearing tube sector can now be expected to be greatly accelerated.

Shareholders' Interest

Before I conclude I would like to assure our Shareholders that while the Company has been following a somewhat conservative distribution policy dictated by requirement of growth and expansion, it would now seek to strike a healthy balance between the needs of the Company and the aspirations of its Shareholders.

Acknowledgement

I would like to acknowledge the support and co-operation we have received from the Government Authorities, Financial Institutions, Bankers, Shareholders, Suppliers and other Business Associates, including Foreign Collaborators. I would also like to thank our customers who continue to place their trust in our commitment to quality and service. I would now take this opportunity to express our sincere appreciation for the excellent work put in by our team at all levels under the able guidance of Mr. B.R. Taneja during the year under review.

Note This does not purport to be a report of proceedings of the 11th Annual General Meeting held at Pune on 2nd Sept. 1989

TELCO

Rising to World Standards

TATA ENGINEERING AND LOCOMOTIVE COMPANY (TELCO) is implementing plans for constructing a modern manufacturing facility at Lucknow. The factory will produce medium and heavy commercial vehicles as well as special purpose vehicles. This plant is expected to play a significant role in the future development and growth of Telco. The company is actively discussing a proposal with Daimler-Benz to manufacture its 'World Concept' range of commercial vehicles. The vehicles would be marketed overseas by Daimler-Benz under its brand and would lead to a technological upgradation of the existing range of vehicles in India. The project would yield substantial exports for the country and would further strengthen Telco's technological base and capability to make vehicles to international standards.

The 'Tata Estate' station-wagon is in the final stages of development and testing. It will be available ultimately in both petrol and diesel versions and will have several sophisticated safety and convenience features which are today found only in cars manufactured overseas. There has been a favourable market response to the Tatamobile 206 Pick-up which was productionised and launched during 1988-89. The vehicle was tested by government agencies and certified as fuel-efficient. Customer feedback has been continuously monitored for effecting further improvements. Though the company plans to produce 5,000 Tatamobiles during 1989-90 in the current year, there will still be a backlog of orders from the bookings which closed in March 1989.

Telco achieved an all-time record sale of 61,691 vehicles (including 10,943 LCVs) as compared to 56,168 (including 8,808 LCVs) in the previous year. For the first time in five years, the growth in the medium and heavy commercial vehicle segment exceeded that in the LCV segment of the domestic market. Amongst the LCVs, the TATA 407 has been widely recognised as the leading vehicle in the LCV market. Exports rose by 63 per cent to Rs 81.40 crore and spare part sales reached a peak of Rs 68.20 crore. A resurgence in excavator sales brought the number of machines sold to 176 as against 168 in 1987-88.

Telco has turned in very good working results with substantial improvement in turnover and profits. Sales turnover amounted to Rs 1,383 crore against Rs 1,163 crore in the previous year and yielded a gross profit of Rs 128 crore against Rs 70 crore and net profit of Rs 70 crore against Rs 27 crore. Increased sales, better profit margins and stringent cost reduction contributed to this achievement. The directors have stepped up dividend by two points to 25 per cent on the enlarged capital. The distribution is covered 2.88 times by earnings, as against two times previously. As the country's largest exporter in the engineering sector, Telco earned foreign exchange of Rs 84.91 crore during the year and its expenditure in foreign currency amounted to Rs 75.29 crore.

* 9 months, ** 15 months

GLINDIA

Continued Expansion

GLINDIA is again changing its name and will be called 'Glaxo India'. The company continues to increase its manufacturing facilities. It incurred an expenditure of Rs 16.37 crore on the creation of facilities for the manufacture of the bulk drugs Ranitidine, Cephalexin and Griseofulvin at Ankleshwar, Ranitidine formulations at Nashik and also on the continuing modernisation of manufacturing operations at other factories, including the foods factory at Aligarh.

The company has fared well during the 9-month period ended March 1989 with sales amounting to Rs 193 crore against Rs 211 crore in the previous 12 months and gross profit of Rs 15.25 crore against Rs 22.95 crore. Profit margins, however, have declined considerably. Net profit is Rs 7.60 crore against Rs 9.97 crore previously. The directors have recommended a dividend of 20 per cent, the same as paid last year for 12-month accounting year. The dividend distribution is covered 1.90 times by earnings as against 2.49 times previously.

This outcome looks creditable, having regard to certain adverse factors faced by the company, such as the trade boycott of pharmaceutical products, substantial price reductions imposed on several pharmaceutical products and a temporarily depressed market for veterinary products. Trading conditions are now more favourable and the new year has commenced well. Sales of food products registered an impressive growth. The company's programme to update and modernise manufacturing facilities at its foods factory has made further progress. Plans are being drawn up to further expand manufacturing facilities and these are expected to be implemented over the next two years, subject to the obtaining of necessary government approvals. The launch of two new products, 'BonnyMix' and 'Jak-N-Jil' manufactured by Hindustan Foods, a new venture for the manufacture of extruded foods, has been completed on an all-India basis. Sales of fine chemicals registered a satisfactory growth despite inflationary pressures on input costs.

Several new items have been added to the range of products exported and assistance has been rendered to small scale manufacturers of bulk drugs to export their products. Glindia's foreign exchange outgo was Rs 5.95 crore (including import of raw materials and goods for resale aggregating Rs 4.06 crore) and it earned foreign exchange on exports of Rs 5.17 crore (including exports through merchant exporters and through rupee trade arrangements).

The company's joint sector project in Uttar Pradesh, Vegepro Foods and Feeds, set up for the processing of soyabean, has made good progress. The refinery was commissioned in January this year. The solvent extraction plant was commissioned in May last and the second stage of the project is in progress. Likewise, considerable progress has been made in the joint sector project in Karnataka, K G Gluco Biols, where commissioning trials for dextrose monohydrate and liquid glucos will commence shortly.

ASIAN CABLES

Faring Better

ASIAN CABLES has fared better during the year to March 31 last as compared to the preceding 15-month period. Sales have been Rs 55.03 crore against Rs 61.33 crore previously and gross profit is Rs 5.18 crore against Rs 6.23 crore. These figures, however, show reduced profit margins. Net profit is Rs 2.40 crore (Rs 3.04 crore) which provides a 3.16 times earnings cover to the 12 per cent dividend as against 6.87 times to the 7 per cent paid for the previous period.

The installation of further equipment for the manufacture of specialised cables and the results whereof, together with benefits of cost control and other measures for enhanced efficiency are reflected in the results. The cable division exported cables worth Rs 9.2 crore. The company has been recognised as an 'Export House'. Total outward remittances of foreign exchange amounted to Rs 10.6 crore.

The Wiltech division continued to consolidate its share of the growing twin blade and shaving systems market. The existing technical agreement with Wilkinson Sword, under which equipment was imported in 1981/82 and also total knowhow for the manufacture of shaving blades, systems and razors was provided, has been renewed for a further period of five years effective 1.5.1987. The process of technology absorption continues apace providing ongoing modifications and improvements being introduced by the collaborator. Exports during the year totalled Rs 12 lakh. For the current year an export order totalling some Rs 85 lakh has been secured and it is also proposed to export twin blades. Extensive sampling of products in potential export markets has been undertaken and communication established with various Chambers of Commerce. Assistance of Wilkinson Sword in identifying export markets for Wiltech products is also specified in the renewed agreement. Access is also being proposed to the export market development fund of the Exim Bank for fully exploiting potential markets. Foreign exchange usage was of the order of Rs 124 lakh.

TATA METALS AND STRIPS

From Textiles to Steel

TATA METALS AND STRIPS, formerly Ahmedabad Advance Mills, transferred the Textiles Division and its related assets and liabilities located at Ahmedabad to New Ahmedabad Advance Mills (NAAM) from close of business on December 31, 1988 under a scheme of restructuring approved by the shareholders. The consideration of about Rs 35 lakh for transfer of that division was paid and satisfied by NAAM by the allotment to the equity shareholders of the company of one equity share of Rs 10 fully paid-up of NAAM for every equity share held in this

IN THE CAPITAL MARKET

Madhusudan Industries

MADHUSUDAN INDUSTRIES is entering the capital market with an issue of 12 lakh equity shares of Rs 10 for cash at a premium of Rs 20 per share. The issue is for part financing the cost of expansion of the company's ceramic tiles and vanaspati units, for technological upgradation of its sanitaryware unit and for setting up of a full-fledged R and D centre at its ceramics division. The company is already expanding its ceramic tiles capacity from 3,500 to 7,000 MT per annum and in the second phase of expansion the capacity will be further raised to 14,000 MT per annum. The capacity of the company's solvent extraction unit is being raised from 25,000 MT to 45,000 MT per annum and a further expansion to 60,000 MT per annum is on the anvil. According to the company's projections, sales will rise from Rs 68.22 crore in 1989-90 to 84.13 crore in 1990-91 and Rs 88.42 crore in 1991-92. In these three years net profit after tax is projected to go up from Rs 1.68 crore to Rs 2.65 crore and to Rs 3.29 crore and earning per share from Rs 5.60 to Rs 8.33 and to Rs 10.97. The issue will open on October 3.

company. Based on the valuation report of an approved and registered valuer, the company has adopted this valuation of its lands at Navsari and Sisodra. The value of lands, after revaluation, is Rs 406 lakh, as against the book value of Rs 49 lakh, showing a surplus of Rs 357 lakh.

The operations of the Metals Division yielded a profit, but after adjusting the loss of Rs 120 lakh incurred by the textile division during the period July to December 1988 the company showed a net profit of only 5 lakh. On account of provision for the tax liability of past years, a deficit of Rs 20 lakh has been carried to the balance sheet. The operations of the hot rolling and cold rolling units showed further improvements during the year with an increase in the production of hot rolled strips and cold rolled carbon steel strips. Significant gains in terms of productivity and cost savings, particularly in the areas of fuel and power, were recorded. Owing to the uncertain stainless steel market, the emphasis has been on marketing higher tonnages of carbon steels and the company has been able to successfully market a larger quantity of carbon steel.

VBC FERRO ALLOYS

New Project

VBC FERRO ALLOYS' directors have recommended a dividend of Rs 2.50 (25 per cent) for 1988-89 (15 months) compared to a dividend of Rs 2 for 1987 (12 months). The company's sales in 1988-89 were Rs 15.32 crore (Rs 13.05 crore in 1987). Gross profit was Rs 1.65 crore (Rs 1.98 crore) and profit after tax Rs 80 lakh (Rs 1.19 crore). The proposed dividend for 1988-89 is covered 1.80 times (3.21 times).

The company's working in 1988-89 was affected by severe power cuts ranging from 30 per cent to 80 per cent for a period of 10 months. In view of the adverse power situation in Andhra Pradesh, the company has installed an imported captive diesel generator plant with an aggregate capacity of 9.08 MVA at a cost of Rs 3.50 crore. The licensed capacity of the company to manufacture 10,000 TPA of ferro silicon has been re-endorsed to 15,000 TPA.

The company is embarking on a major diversification programme to manufacture 36,000 TPA of low phosphorous pig iron for which it has obtained the necessary licence. The project is estimated to cost about Rs 14.80 crore. The company proposes to import equipment for the project worth Rs 2.09 crore from the Soviet Union on 10-year deferred credit terms. The balance cost of the project is proposed to be met by the issue of debentures/bonds subject to the consent of the CCI.

NOTICE

LARSEN & TOUBRO LIMITED

It is hereby notified for the information of the public that M/s. Larsen & Toubro Limited propose to make an application to the Central Government in the Department of Company Affairs, New Delhi, under sub-section (2) of section 22 of the Monopolies and Restrictive Trade Practices, Act, 1969, for approval to the establishment of a new undertaking. Brief particulars of the proposal are as under:

1. Name and Address of the applicant	: LARSEN & TOUBRO LIMITED Registered Office: L&T House, Ballard Estate Narottam Morarjee Marg Bombay 400 038
2. Capital Structure of the applicant organisation	: As on 31.3.89
Authorised Capital	: Rs. 75,00,00,000
Issued Capital	: Rs. 60,74,88,440
Subscribed Capital	: Rs. 60,74,88,440
3. Management Structure of the applicant organisation indicating the names of the directors, including managing/wholetime directors and manager, if any	: The Company is managed by the Managing and Wholetime Directors subject to the supervision and control of the Board of Directors.

Names of Directors:

1. Mr. D.H. Ambani	— Chairman
2. Mr. M.D. Ambani	— Vice-Chairman
3. Mr. U.V. Rao	— Managing Director designated as Chief Executive Officer
4. Mr. S.R.R. Subramanian	— Managing Director designated as President
5. Mr. D.L. Pradhan	— Wholetime Director designated as Vice-President
6. Mr. S.P. Kashyap	— — do —
7. Mr. C.R. Ramakrishnan	— — do —
8. Mr. S.D. Kulkarni	— — do —
9. Mr. M.P. Wagh	— — do —
10. Mr. Y.H. Malegam	— Director
11. Mr. R.M. Gandhi	— — do —
12. Mr. Klaus Henseler	— — do —
13. Mr. A.S. Gupta	— — do —
14. Mr. S.E. Dastur	— — do —
15. Mr. S.S. Marathe	— — do —
16. Mr. S.N. Shende	— — do —
17. Mr. M.L. Bhakta	— — do —
18. Mr. A.D. Ambani	— — do —
19. Mr. N. Ganga Ram	— — do —
20. Mr. A. Binder (Alternate to Mr. Klaus Henseler)	— — do —

4. Indicate whether the proposal relates to the establishment of a new undertaking or a new unit/division	: The proposal relates to the establishment of a new undertaking which will form a part of Larsen & Toubro Limited.
5. Location of the new undertaking	: Krishnadevipeta, Visakhapatnam Dist., Andhra Pradesh. We are also prepared to consider any other location suggested by Govt. based on availability of raw materials.
6. Capital Structure of the proposed undertaking	: Same as that of the applicant organisation
7. In case the proposal relates to the production, storage, supply, distribution, marketing or control of any goods/ articles, indicate	: :
i) Name of goods/ articles	: Sandy Alumina
ii) Proposed Licensed Capacity	: 1 million tonnes per annum
iii) Estimated Annual Turnover	: Rs. 470 crores at stabilised production.
8. In case the proposal relates to the provision of any service, state the volume of activity in terms of usual measures such as value, income, turnover etc.	: Not applicable
9. Cost of the Project	: Rs. 1080 crores
10. Scheme of Finance, indicating the amounts to be raised from each source	: Rs. Crores
i) Term loans/ Debentures/ Foreign currency loans	: 810
ii) Internal Generation/ Equity Issue	: 270
	1080

Any person interested in the matter may make a representation in quadruplicate to the Secretary, Department of Company Affairs, Government of India, Shastri Bhavan, New Delhi, within 14 days from the date of publication of this notice, intimating his views on the proposal and indicating the nature of his interest therein

Dated this 25th day of August, 1989

S.D. KULKARNI
VICE PRESIDENT (FINANCE)

Calcutta Diary

A M

The cynics are still full of Tiananmen Square. One night at Tiananmen Square, however, does not constitute history. History takes a longer view of both heroes and traitors. Consider the case of Klaus Fuchs, who died some months ago in the GDR, full of, as they say, years and honours.

WHY turn into commonplace an issue of great philosophical import? True, the precise usage of the expression 'traitor' has always been a little uncertain; it was, and continues to be, a catch-all. One can be a traitor in the conventional sense, that is, to the nation. Traitors of this species, if one is to believe this country's prime minister, are dime a dozen; they therefore cease to be interesting. The reality is however hardly that simple. For one can be a traitor to friends too, or to a cause, or to an ideology—or at least to a particular interpretation of the ideology. The problem an ideologue faces—the classical problem, you might almost say—is over the decision he or she has to take; conscience no doubt is king, but what should be the verdict of conscience when the critical moment of decision-making arrives? Does one turn a traitor to one's country, to one's friends, or to one's ideology? By its very nature it is going to be an act of great betrayal, but whom does one betray, the cause, the country, or one's personal friends? Or could it be that one ends up by turning a traitor to each and all?

Consider the case of Klaus Fuchs, who died some months ago in the German Democratic Republic, full of, as they say, years and honours. Son of a liberal-minded cleric and a neurotic mother, Fuchs drifted from the youth wing of the Social Democratic Party to the Communist Party in his late teens, and escaped from Germany the day the Reichstag was set on fire in 1933. He ended up in England. The British establishment took care that this young refugee from Nazi persecution was provided with all the opportunities of higher education. Fuchs turned out to be one of the most brilliant theoretical physicists of his generation; he did research in Bristol, moved to Edinburgh, and ended up in Birmingham. On the commencement of the second world war, he was chosen to join the small group of scientists whom the government asked to carry on clandestine research on the problems of nuclear fission. Once the United States joined the war in December 1941, the separate British and American research activities, concentrating on unravelling the secret of the atom which could lead to the manufacture of a bomb of extraordinary destructive capability, were placed under a collaborative arrangement. Fuchs, who had meanwhile become a British citizen, was amongst the handful of British scientists who were sent across to New York to work on the now famous Manhattan project on the nuclear bomb. After a while, he was transferred to Los Alamos in New Mexico, where the actual work of assembling the bomb was taking place under the overall guidance of Robert Oppenheimer, culminating in that fearful, magnificent implosion in early 1945, to describe which Oppenheimer had to take recourse to the Upanishads: 'brighter than a thousand suns'. The atomic bomb arrived. It was duly detonated to annihilate Hiroshima and Nagasaki. Japan surrendered, the war ended, and Fuchs moved back to England to join the newly established atomic energy research laboratory at Harwell as head of its theoretical physics department.

Fuchs was a bachelor, a quiet, reserved individual, whom wives of colleagues liked to mother, in Bristol as well as Edinburgh, in Birmingham as well as Los Alamos, and later at Harwell. His scientific brilliance was widely acknowledged, and, despite apparent passivity on his side, relationships were formed and friendships established. None amongst his colleagues or their families knew, or even guessed, the secret he carried within himself. He had remained a communist all along, a passionate ideologue, who believed that the Soviet Union was the only hope for human civilisation. He therefore considered it his duty to pass on, on a regular basis, to representatives of the Soviet Union detailed information on the kind of work concerning the nuclear bomb that was being pursued in Britain and America. He had established contact with Soviet agents while in Birmingham itself, and he kept transmitting highly classified information, including detailed formulae and diagrams relevant to the manufacture of the bomb, from New York and Los Alamos. Contact with the Soviet agents thinned out when he joined Harwell, but it was not altogether terminated. It is largely due to detailed briefings from Fuchs that the manufacture of the Soviet bomb could be advanced by as much as a couple of years. In the time scale of the furious cold war that was on in the late forties and the early fifties, that was an incalculable gain for one side, and an incalculable loss for the other.

Fuchs was found out in 1950, after the Americans were able to break the war-time Soviet wireless code and unscramble the messages that had passed during the war years between Moscow and the Soviet embassy in Washington. Confronted with the charge of espionage, he straightaway confessed. He was almost anxious to come clean, and he came clean. It was at that time suggested that his readiness to confess was perhaps on account of his anxiety to save from trouble his colleagues and friends at Birmingham, New York, Los Alamos and Harwell, all of whom would otherwise have continued to be under the cloud of suspicion; he had already betrayed his adopted country, the country which had been so good to him, but he did not want to compound that guilt by creating difficulties for his friends who had, in good faith, accepted him in their bosoms. His affirmation that he operated on his own and had no collaborator would bail out all those who had, at some time or other, worked with him or offered him hospitality: this, Fuchs felt—at least it was hinted that this was how he felt—was the minimum he could do; besides, now that he was in any case

caught, acting in this manner would in no way compromise his ideology, so his conscience was clear on that score too. Fuchs made a full confession. He was sent up for trial and was given the maximum sentence under the relevant statute, rigorous imprisonment for fourteen years. One-third of the term was taken off for good conduct, and Fuchs was released at the end of ten years. He flew off to the German Democratic Republic, where he was received warmly and offered a number of prestigious academic and research appointments one after another.

Till now, it is almost a conventional story, an archetypal story of an espionage agent doing the work assigned to him, getting caught, being thrown to prison and quietly migrating on his release to the country on whose behalf he had spied. The only point of departure is the fact that Fuchs did what he did not on account of money, but because of ideological convictions.

This particular case however had other ramifications. Fuchs had confessed to the British authorities. Under the law, he could not be extradited to the United States, and the American administration was in no position to bring him to book. Fuchs nonetheless agreed to be interrogated, *in British prison*, by the American Federal Bureau of Investigations. Were he to refuse to be questioned by the FBI, the latter would have been in a jam. In fact, because McCarthy was already on the rampage in the United States, anti-American sentiments were ascendant in Britain, and there was an uproar in parliament at the news that the FBI was being allowed to interrogate a *British* prisoner. But since Fuchs had *volunteered* to speak to the American agency, the controversy died down in due course.

To the Americans too, he came clean. Once more, it could be that he was tortured by his conscience; he was perhaps afraid that, should he hold back anything, or provide the impression he was holding back, his former colleagues in the United States would not be left in peace by the FBI; that was the period when the American mind was obsessed by the theme of 'guilt by association'. The instant issue for him, then, was not to play Judas to his friends. In the process, though, Fuchs did something whose moral consequences keep reverberating till this day. Anxious to convince the agency that he was co-operating with it to the fullest extent, he identified for the FBI a photograph of his only Soviet contact in the United States, a person whom he knew as 'Raymond'. Thanks to the clue provided by Fuchs, 'Raymond' was tracked down; he turned out to be Harry Gold, a part-time chemist and part-time order-supplier residing in Philadelphia. Through Harry Gold, the FBI reached out to yet another Soviet atom spy, David Greenglass. And it is on the testimony of these two—testimony which, many suspect, was replete with perjury—that Greenglass' sister-in-law and her husband, Ethel and Julius Rosenberg, were sent to the gallows.

So it cannot really be said that Fuchs was able to work out the optimum solution to his moral problem. By the manner he co-operated with the FBI, he perhaps succeeded in saving his scientist friends in the states and their families from harassment and social ostracisation. But precisely because he did that, the Rosenbergs, whom he did now know and yet who were his ideological colleagues, had to die. He chose not to be a traitor to his firends. By virtue, of this particular decision on his part, he however chose to be a traitor to his ideology. Did he choose right? Was he, once having made the choice, at peace with his conscience? Even assuming his conscience ceased to persecute him—about which we do not know—the larger philosophical question remains: was he right?

Once the Fuchs episode reached its finale, at least one other point was clinched. Fuchs had a constructive responsibility for the deaths of the Rosenbergs, who, by all accounts, were magnificent communists, calm and strong and tenaciously loyal to their ideology till the very end. By the same measure, Fuchs was a lapsed ideologue; it was on account of the specific manner he resolved the dialectics of his conscience that two noble and worthy comrades were denied their further living. But the ideology, and the apparatus which supports the ideology, were forgiving enough. A comrade is liable to commit errors, even costly errors. He is a comrade nonetheless. At the end of his period of incarceration, Karl Fuchs, who had meanwhile been divested of his British citizenship, was not a lost soul. His comrades in the German Democratic Republic had shelter and research-cum-academic assignments ready for him. There was a fresh beginning waiting for him, a beginning which, gently and quietly, brought home the message that you and I might occasionally weaken and betray the cause, but the cause does not betray us, the cause is much more generous than our subjective alarums will induce us to concede.

The cynics will not agree. They are still full of Tiananmen Square. One night at Tiananmen Square however does not constitute history. History takes a longer view of both heroes and traitors.

APPOINTMENTS

Panchayati Perestroika?

V R Krishna Iyer

The lack of the required majority in the Rajya Sabha has forced the prime minister to stage a strategic retreat until the next session of parliament in October. This interval may be the time for a dissection of the much bruited panchayat and nagarapalika bills which are of common genetic code, structural mould and political goal.

THE sound and fury of the panchayati controversy has abated for a while. The euphoric clap-trap by the prime minister's claques in parliament, aided by the command performance of the electronic media and other engines of publicity, about the uniqueness of Rajiv Gandhi's eureka of panchayati raj, on the one side, and the epileptic opposition challenging, with dubious unity, the claim of 'Power to the People' as histrionic, not historic, as baloney, not bona fide, and screaming with alarm that state autonomy would be shot down by the central Czar using democratic decentralism as a deadly stratagem, on the other, leave the masses dazed and dumb. Because the prime minister's brute majority is short of the constitutional minimum by a few who have yet to be magneted into his fold, he has staged a strategic retreat until the next October session. This lucid interval may be time for an autopsy of the anatomy of the much bruited panchayat and nagarapalika bills which are of common genetic code, structural mould and political goal.

The claim made for the Constitution (Sixty-Fourth Amendment) Bill (and for the Sixty-fifth) is unbelievably breath-taking. Lord Rippon revived village panchayats of Rig Vedic vintage and feudal parentage. But its colonial mintage, under bureaucratic bondage, made for local bodies sans self-governing souls. However, for the cornerstone of the ideological edifice of local self-government, in its dynamic incarnation, we must turn to Gandhiji. Mahatmaji gave the message of gram swaraj as integral to poorna swaraj. Pandit Nehru, with his developmental concern, institutionalised panchayati raj, as an instrument, but with poor success. Indira Gandhi, with some scepticism though, imparted a participative dimension to it for socio-economic transformation, but the states did little justice to these self-governing units. And the third generation ruler, Rajiv Gandhi, with dauntless double-speak, now proclaims revolutionary salvation for the rural (and urban) masses through his panchayat and nagarapalika bills with an election-year yen for populism. In a passionate fit of (manuscript?) peroration, the prime minister told the House (on 7.8.1989):

> We seek through these bills to vest power in the only place where power rightfully belongs in a democracy—in the hands of the people.

If taken at its verbal value, the Russian October Revolution of 1917 will pale before this Indian October (?) Revolution of 1989. So let us scrutinise this serendipitous organ of grassroots democracy seriously, although the credentials of the author debunk his radical verbalism. For instance, did he, as president of his party, ever hold elections in recent years? Democracy must begin at home. Were the chief ministers from his party—or PCC chiefs, for that matter—mere Delhi impositions, with political puppetry writ large? Was his style of inducting and jettisoning central ministers an autocratic process? His imperious track record, from driving cars to performing in parliament and managing the nation's affairs as if it were India (Private) Limited, contradicts all known democratic norms. And how about the callous frequency with which he superseded state legislatures? However, when parliament debates a constitutional amendment we owe it to that great institution to discuss the issue responsibly. Not the playwright but the play it is that matters.

Certain fundamentals must be remembered before discussing the bill and the claims made for it. The Rig Vedic and medieval panchayati outfits of nostalgic fancy are casteist fossils and are irrelevances because the functional dynamism expected of them now is developmental participation, as a democratic right, geared to the new decade's challenges. Therefore, forget that boast first. The second factum is that the root concept of the panchayati system, as a unit of self-government, is derived from Gandhiji's vision.

> My idea of village swaraj is that it is a complete republic, independent of its neighbours for its own vital wants, and yet interdependent for many others in which dependence is a necessity... The government of the village will be conducted by the panchayat of five persons, annually elected by the adult villagers, male and female, possessing minimum prescribed qualifications. ... this panchayat will be the legislature, judiciary and executive combined to operate for its year of office.[1]

The credal essence of gram swaraj is its character as village republic, with elections based on adult franchise and powers judicial, executive and legislative adapted to that micro-level. Lenin's Soviet and Gandhi's *gram swaraj* are ideological comrades! The Constitution, in Article 40, has mandated, as a principle fundamental in the governance of the country, the organisation of panchayats endowed "with such powers and authority as may be necessary to enable them to function as units of self-government". Pursuant to this constitutional command, most states have legislated into existence panchayats of sorts.

Why was panchayati raj not made mandatory and operational but accommodated only as a policy directive, notwithstanding its Gandhian halo? Because Ambedkar condemned these feudal, feud-stricken, localist, communalist sinks of medieval vintage where the weaker sections were the victims. There were others too—perhaps, even Lal Bahadur Shastri—who were sceptical about these polluted organs for other reasons. A compromise formula (Article 40) was the conversion of the panchayati concept into a mere commendable project depending on time and circumstance.

Our founding fathers thus emphasised two factors. The first was that without a network, on a national scale, of units of full-blooded local self-government with participative power, a viable and vibrant democracy was impossible. So they made it fundamental in the governance of India. This political desideratum would be romantic farrago unless corrective attention was paid to the Ambedkar caveat against the reactionary, faction-riven, mafia-overrun composition of panchayat regimes. A socio-economic offensive, oriented on values of social justice, land distribution and human liberation are conditions precedent to gram swaraj. This is the meat of the matter. With all our boasts and all our hopes, gram swaraj will not take off until socio-economic egalite becomes a fact of village life. Even so devout an admirer of Rajiv Gandhi as Vasant Sathe recently wrote:

> To that extent it will become more democratic. But the pertinent question will be as to what power will these Panchas exercise in the day-to-day socio-economic life of the people or the community living in these villages. Unless this becomes clear, in our scheme of revival of the panchayat system, mere revival of the institution would not help and it would be a superficial and redundant exercise. The issue is so basic and big that the very magnitude of the problem scares the planners, economists and administrators and they want to skirt it and circumvent it by avoiding the issue. The tendency is just to think superficially and simplistically of providing an elected institution and making elections mandatory to these panchayats under a central law. The

fact that panchayat system has not succeeded and survived mainly because of its having become irrelevant to the socio-economic life of the village in an industrial society is conveniently ignored and it is being felt that merely by providing an elective institution, the problems of people living in village can be solved.[2]

Nehru, democrat, socialist and man of the masses and of tribals, knew this truth and its blistering absence in rural India. Singhvi's Committee neatly tells us:

> The Community Development Programme was launched in 1952. The blocks came to be established as units of development administration. The National Extension Service was established soon thereafter with a view to reinforce the administrative network to tackle the problems of growth and development at different local and functional levels. At that stage there was, relatively speaking, only nominal public participation through nominated representatives of the public. Soon, lack of public involvement and participation began to be perceived as an impediment in the successful implementation of the Community Development and National Extension Service Programmes. Based on that perception, the Second Plan document concluded that "unless there is a comprehensive village planning, which takes into account the needs of the entire community, weaker sections like tenant-cultivators, landless workers and artisans may not benefit sufficiently from assistance provided by the government". Referring to the aim of the National Extension Movement to reach every family in the village, the Second Five-Year Plan reported that in order to fulfil that aim it was necessary to have "an agency in the village which represents the community as a whole and can assume responsibility and initiative for developing the resources of the village and providing the necessary leadership. Indeed, rural progress depends entirely on the existence of an active organisation in the village which can bring all the people including the weaker sections mentioned above into common programmes to be carried out with the assistance of the administration."[3]

The fundamental error was the failure to realise the importance of village initiative, village democracy, village economics, village government without bureaucratic incubus, beyond simply being tools of developmental projects dictated by technological bosses and planning experts. This spinal weakness deprived panchayats of their dynamism and reduced them to caste cliques and politicised talking shops.

The Balwantray Mehta Committee (1957) cognised this fatal flaw and found that:

> Development cannot progress without responsibility and power. Community development can be real only when the community understands its problems; realises its responsibilities, exercises the necessary powers through its chosen representatives and maintains a constant and intelligent vigilance on local administration.[4]

It was with this objective that the team recommended an early establishment of statutory elective local bodies and devolution to them of the necessary resources, powers and authority.

The above committee commended a three-tier scheme and highlighted the following failings:

(1) The panchayats in general *do not truly represent all the elements in village life, including* the haves and *havenots*.

(2) There are *internal factions and feuds* which are sometimes of old standing. The *number of panchayats* torn by *factions* or in which squabbles are rampant *is large*.

Nehru, with crimson hope, inaugurated the new breed of panchayats in Nagaur on October 2, 1959 describing this experiment as "the most revolutionary and historical step in the context of new India".

The flush of great expectations faded when the momentum was lost and long procrastination of elections, frequent supersessions, flourishing political intrigues, slow decadence and disarray, with no devolution of powers coupled with financial starvation, functional ennui made these gram raj organs ceremonial ciphers, feudal pools of communal feuds and happy hunting ground of power-brokers.

A review of these pathological creatures by the Ashoka Mehta Committee (1977) revealed a lurid picture:

> In sum, an overview of the national scene would indicate that the activities of PRIs [panchayati raj institutions] were meagre, their resource-base weak, and the overall attention given to them niggardly... PRIs are dominated by economically or socially privileged sections of society and have as such facilitated the emergence of oligarchic forces yielding no benefits to weaker sections. The performance of the PRIs has been vitiated by political factionalism rendering developmental thrusts either warped or diluted. Corruption, inefficiency, scant regard for procedures, political interference in day-to-day administration, parochial loyalties, motivated actions, power concentration instead of service consciousness—all these have seriously limited the utility of panchayati raj for the average villager.

The committee, however, was not prepared to view panchayati raj as 'a god that failed'. It noted the following merits:

(1) Politically, it became a process of democratic seed-drilling in the Indian soil, making an average citizen more conscious of his rights than before.
(2) Administratively, it bridged the gulf between the bureaucratic elite and the people.
(3) Socio-culturally, it generated a new leadership which was not merely relatively young in age but also modernistic and pro-social change in outlook.
(4) From the developmental angle, it helped rural people cultivate a developmental psyche.[5]

This historical backdrop will be complete if we gather the present status of panchayats as grassroots sub-state units. Singhvi gives a lovely precis:

> After the Balwantray Mehta Study Team reported, legislation was enacted in different states except in the state of Meghalaya and Nagaland and UTs of Lakshadweep and Mizoram. According to the committee set up by the Planning Commission which reported in 1985, a three-tier system has been adopted in 12 states and 1 union territory, two-tier system exists in 4 states and 2 union territories. Electoral system also differs from state to state. In terms of structures, electoral procedures, powers and functions, there is a considerable variety in the panchayat institutions adopted by the states. There are, today, more than 2,17,300 village panchayats in the country covering over 96 per cent of about 5.79 lakhs inhabited villages and 92 per cent of the rural population of our country. There are about 4,526 panchayat samithis of different nomenclature at the block, taluka or tehsil level. There are about 330 zilla parishads covering about 76 per cent of the districts in the country; each zilla parishad has on an average 13 to 14 panchayat samithis and about 660 gram panchayats.
>
> Though there are variations from state to state, it may be broadly stated that the functions entrusted to panchayats include village roads, community wells, maintenance of public parks, tanks, irrigation works, public hygiene, drainage, and other civil services. In some states, they are also responsible for primary education and are entrusted with functions relating to rural industries primary health care, medical relief, women and child welfare, maintenance of common grazing grounds and other community lands and properties and provision of inputs of agricultural production. The extent and tempo of the involvement of panchayati raj institutions in basic planning and implementation of development projects is also subject to wide variations from state to state and even within the states. Most panchayati raj institutions appear to suffer from grave insufficiency of resources which generally devolve upon them from assignments in the land revenue and water rate, or additional surcharge on cess on land revenue and water rate and various grants by the state governments; in some cases revenue is derived from octroi and assignment of forest revenue. Some of the panchayati raj institutions also derive income from taxes on buildings and non-agricultural lands or from surcharge on stamp duty on transfer of immovable property. Variable in terms of yield, but not unimportant in the lives of Indians in rural areas, there are local taxes, fees, cesses, tolls, licence fees and other similar levies, on trades, industries, water supply, sanitation, lighting, markets, bazars, and *haats*, rest houses, bus stands, cart stands, camel parking, vehicle parking, animals, cattle ponds, fish ponds, slaughter houses, ferries, bridges, cattle grazing lands and commercial crops. The list of subjects on which levies may be made may not appear to suffer from brevity but the sum total of yields and collections do suffer from chronic paucity particularly in the context of the responsibilities which

are or ought to be entrusted to panchayati raj institutions and their significant bearing on the quality of life in our rural areas.[6]

These generalities apart, some poignant rural realities of village India and slum India need to be appreciated before assessing the panchayati paradise promised under the bill. There are around 160 million dalits (SC/ST) in our country whom we may call the Fourth World within the Third World. With them in mind Ambedkar observed:

> Thank God the Indian Constitution did not adopt the Indian village as the base of the constitutional pyramid of autonomous administrative units with its own judiciary, legislative and executive.

Could there be justice to the *pariah* in gram swaraj where it is controlled by superior castes? His allergy was to the Indian ghetto and the *antyajas* outside the Hindu social order. Is not this social horror still real in many states? Until that disappears, any power to the panchayat would only be aggravating the afflictions of the weaker sections. He dichotomised village demography into the upper classes and the untouchables, there being no democracy between the two. What haunted him was the persecution of the untouchables in the villages where they were rightless, disorganised, bonded labourers and suffered from the dependencia syndrome, where the dominant classes lorded over the life of the lower brackets. Graded inequality was the grim reality. Ambedkar's opposition surely will be shared by the scheduled castes and scheduled tribes and other weaker sections even today. The romantic picture of rural democracy was criticised also by Charles Metcalfe, a civil servant of the East India Company. After all, in all conscience, do not the 'touchables', the majority, live *in* the village, while the 'untouchables', the suppressed sector, live *outside* the village? Economically too, the touchables are powerful while the untouchables have the status of hereditary bondsmen. Where gross disparities, social and economic, handicap large groups, political panchayatism is opium. First things first.

On a deeper probe, Gandhiji's panchayati dream makes big assumptions, fulfilment of which is condition precedent to an egalitarian village management. His vision was naive:

> The government of the village will be conducted by the panchayat of five persons annually *elected by the villagers, male and female* possessing minimum prescribed qualifications. These will have *all the authority and jurisdiction required*. Since there will be no system of punishments in the accepted sense, this panchayat will be the legislature, judiciary and executive combined to operate for its year of office. Any village can become such a republic today without much interference...[7]

In *The Harijan* (July 28, 1946) he wrote:

> We must have a proper picture of what we want, before we can have something approaching it. If there ever is to be a republic of every village in India, then I claim verity for my picture in which *the last is equal to the rest*, or, in other words, *no one is to be the first and none the last*.[8]

He fiercely opposed caste and said that Hinduism and village swaraj would perish, if the curse of caste flourished. He stood for land distribution in panchayati raj and regarded zamindari as evil. Clearly, Gandhiji envisioned conditions of a casteless village with equal rights and elected panchayats, without prescriptions from above and condescension from the apex. Once these prescriptions and proscriptions become actualisations, his notion of village republics may become acceptable. But in Rajasthan and Bihar, not to speak of other states, untouchability is a blistering fact of life where women are sold or are slaves or face sati or devadasi fate. It is dangerous to dabble in glittering slogans, departing glibly from rural poignancies.

Symbolic of the sombre lot of dalit women *even* today is the prevalence of bonded labour and worse, the carrying of wet human excreta by SC women. *The Deccan Herald* reported recently:

> According to Mr N M Adyanthaya, INTUC president, on June 14 in Bangalore the prime minister gave "an assurance that the union government will enact a law banning the carrying of night-soil throughout the country.

What does it matter for a chandala girl, whose little wage is earned by carrying head-loads of wet human excreta, or for a bonded labourer who survives on a landlord's estate, to be a harijan benamidar on the panchayat board with reflex actions when kulak bosses send signals? The hard realities and harrowing inhumanities writ large on Indian social life must condition the revitalisation of panchayati raj.

The Problem

It is a categorical imperative of the rural dynamics of development and democracy that the masses must participate *as of right* in the processes of self-government and planned development. The saga of village India has been surrender to social injustice through the centuries. Today the twaddle about the 21st century and high-tech miracles apart, India lives in her villages and villages live simultaneously in several centuries. People's involvement in national reconstruction is *non est*. Power to the people today means, in many states, power to the caste leader, latifundist, local contractor, political power-broker, lumpen goonda, smuggler, racketeer, and mini-mafiosa. When you reserve seats for scheduled castes and tribes in villages with dominant classes, middle men and dadas, it gives scope for stooges. The name of the game is puppetry. If they revolt they will be shot. In Bihar—and other states too—if the village dalit demands minimum wage he is liquidated. If the bonded family is released by court or other officer, rehabilitation money is swallowed systematically by operators and the family is back in servitude. If the tribal asks for his forest land his life is lost. If he agitates, the police-landlord coalition breaks his back. If women in sati country or devadasi district or where tribal girls, as in Madhya Pradesh, are trafficked in weekly fairs, how can they be free in reserved seats? The consequence may be fatal. If the untouchables in Rajasthan or elsewhere seek entry into Nathdwara or some other temple their life will be in peril. The panchayat power too is untouchable and unapproachable for these primitives, except as puppets. By way of aside, is it not a fact that *sati* persists and *sati* shrines flourish? Is it true that the prosecution of the rabid caste-Hindus, who attacked the harijans when they marched into Nathdwara, has been since dropped? Who has faith in your law where the lawless get away with it? Land reforms are a dead letter in Rajiv Gandhi's India; implementation of ceiling on urban land is tokenism, these laws being but a paper tiger. The villagers are socially meek and politically weak. In this noxious landscape, elections lose potency and candidature is benami; women and dalits suffer the dependencia syndrome. More money to panchayats and more power to sarpanches means more power to the power-brokers, more money to middlemen. Panchayati raj has alcoholic potential in primitive societies and mafia politics. A quantum jump from the currently illiterate backwardness and communal domination, aggravated by proprietariat pressure over the proletariat, to the basic decencies of politics and guarantees of human dignity, distributive justice in land ownership, gender justice, collective will to demand the civil rights minima under the law—until this desideratum is actualised in law and life, gram swaraj is a tantalising mirage. The criminalisation of politics and politicisation of criminalistics add gravely to the terrorism of gram raj.

At this stage, one may usefully formulate the conditions on the ground and the imperatives of a prospective legislation to establish a fair rural deal.

Panchayati raj, as such, is a national component of democratic decentralisation—a consummation devoutly to be wished. Currently, the nation suffers from over-centralisation *vis-a-vis* the states. The union list is being gradually aggrandised by taking over more items from the State List beyond what the founding fathers considered good. Indian constitutionalism, over the decades, has been gradually gravitating towards the vanishing point of federal jurisprudence. When suddenly the prime minister, the prime culprit of super-centralism, pleads for decentralism he is suspect. Panchayats fall within Item 5 of List 2 (State List). Everything to renovate, revamp and restructure panchayats and nagarapalikas is even now within the legislative power of the states. The Sarkaria Commission, alive to the

denudation process, has not suggested any constitutional amendment for strengthening local bodies *except as a last resort*. A model national bill, circulated to the states, may well work the trick if financial baits and other pressures are applied. This is a familiar method. Secondly, it is possible to persuade a few states to move under Article 252 and enable parliament to legislate for the states on panchayati raj. These have not been tried and there is no particular hurry to rush through a constitutional amendment on a matter which is the primary concern of the states. National consultation, not confabulation with collectors, country-wide debates involving economists, jurists, sociologists, politicians, activist groups among tribals and women and other experts are the prerequisites. Hasten slowly, not hurry suspiciously, if broad consensus, not bulldozed legislation, is the desideratum. When a megalomaniac in protem power weeps for gram swaraj Dr Johnson's wit comes to mind. If a butcher says his heart bleeds for his country (says Dr Johnson), be assured, there is no uneasy feeling in his bosom! Even so, some good grounds are given in the prime minister's speech in parliament which we must examine objectively. The reasons given are that the states are guilty of not holding regular elections and of superseding indiscriminately local bodies whose terms have not expired. The reasons for these aberrations are often political. There is force in the prime minister's argument that:

> The essence of democracy is elections. Elections to panchayati raj institutions have been woefully irregular and uncertain. A mandatory provision in the Constitution is sacrosanct. A statutory provision in the state law does not have quite the same sanctity. We propose through this bill to enshrine in the Constitution regular, periodic elections to panchayati raj institutions. We also propose through this bill to end the other sickness which has overtaken panchayati raj in many parts of the country, that is, the sickness of unending suspensions and dissolutions. In the absence of any compelling provision to re-constitute panchayats within a reasonable period of time by democratic elections, suspended panchayats have remained suspended for years on end and dissolved panchayats have remained dissolved for up to a decade or more. In the existing municipal law on the subject state legislatures have given the executive authority such wide powers to abort the institutions of panchayati raj, and delay reconstituting them that these institutions have been leached of their ability to stand on their own as representative forums of the people's will. Their existence has depended less on the mandate of the people than on the whims of state governments...
>
> Our bill would make it mandatory through the constitution for all panchayats dissolved before the expiry of their term of office to be reconstituted through democratic elections based on adult suffrage within six months of the dissolution to complete the remaining term.[9]

Culpability in postponement of elections and superseding panchayats, etc, belongs mainly to the Congress governments and it is regrettable that the president of the Congress Party, whose royal fiats have been taken lying down by his party echelons, should now feel that he cannot persuade his party governments to become paradigms and hold periodical elections to panchayats and must, therefore, resort to constitutional compulsions by way of amendments with so much song and dance as if he were history's Columbus, since Lenin, to discover People's Power. There is motivationally more than meets the eye in this matter. Even so, let us assume that the delinquent states, Congress or non-Congress, deserve to be disciplined into holding periodic elections and must be forbidden from superseding recklessly and for long. A constitutional amendment may, to this limited extent, be the only option. Truly evasion of polls to local bodies is a besetting sin of most ruling parties.

Political puerility is writ large on the proposed amendment. While the constitution, though paramount, is not immutable, its amendment is not a plaything for political juveniles nor a stratagem to obliterate the Legislative Lists wrought, after careful thought, by our founding fathers. Is it not unfair to our Constitution to monkey with it as often as some cerebral irritation provokes a supremo to chop or change its provisions through instant amendments? Is it not injustice to the *supreme lex* to weaken the extant state autonomy and directly reach down to grassroots clientele to gain political mileage and tempt the rural proletariat with slogans like Power to the People and paradise for the unemployed.

Nevertheless, why not restructure *gram* democracy, make it real and seize power for the pariahs of society through dialectically engineered panchayati perestroika?

Bullets instead of Rice

In the evening help came to the starving people in the form of gun-toting CRPF men. They began brutally attacking the women with rifle butts and then opened fire on the defenceless crowd. The chief minister of Tripura justified the CRPF action, claiming that there was no other alternative.

THE first day of the monsoon session of the Tripura legislative assembly was marked by a storm of protests, by the opposition Left Front members, over the cold-blooded action of the CRPF at Damcherra village in North Tripura district on July 27, which left four starving people dead and injured nine others, for their 'heinous' crime of asking for rice free of cost after enduring starvation for months on end.

Like the other interior areas of Tripura where the tribal population predominates, Damcherra, a sleepy little tribal hamlet, in North Tripura district has been reeling under an acute food shortage over a year now. The all-pervading food crisis besetting Tripura is no doubt due, partially at least, to her lack of self-sufficiency in food production. The central government too cannot be absolved of the crime of keeping the state on the brink of starvation by systematically depriving it of its quota of rice. Needless to say, the coalition government, instead of demanding its rightful share has been maintaining a subservient silence at this discriminatory treatment and has been taking care to sustain the illusion of a fairly comfortable food stock position everywhere in the state. However, the acuteness of the crisis, especially in rural areas, is the creation of the corrupt ration shop dealers owing their allegience to the Congress(I). Taking advantage of the scarcity of rice, they sell their quota in the black market at exorbitant prices while the poor people do not get rice at fair prices from the ration shops. Obviously, these machinations take place with the blessings of the powers that be. Aggravating the already critical situation in the hilly interior of the state is the total non-availability of work for the rural poor under poverty alleviation schemes despite the much-touted Jawahar Rozghar Yojana. The total indifference of the coalition government to its responsibility of giving work and providing the poor with a source of income has led to the latters' lack of purchasing power and made their crisis all the more acute. It has been reported that at least 20 starvation deaths have taken place in the state since the coalition government took over. The firing on unarmed and starving people by the police and the CRPF in Damcherra on July 27 is the culmination of the long saga of starvation and death that has stalked the state during the last 18 months of Congress(I)-TUJS misrule.

Damcherra village is a marketing centre in Kanchanpur block in North Tripura district and adjoins Mizoram. Along with other remote tribal villages in the block, it has been reeling under an acute food and work shortage for the last one month at least. Although records show that rice has been procured regularly from the food godown at Damcherra, by the local ration shop dealer, who is a known Congress(I) henchman of the area, the ration card holders have been unable to get rice from the shop, which is open only once a week. According to the local people, the rice from the ration shop has regularly found its way to the black market in Dharmanagar, the nearest town, where rice fetches an exorbitant price. So, the ration card holders at Damcherra have to come away empty-handed most of the time, even when they are lucky enough to have enough money to buy their rations. In Damcherra because of the lack of work in the area, it is impossible for the people to afford even ration rice when it is available. Obviously, buying rice at black market rates prevailing in the Damcherra market is out of the question for them. It is alleged by the local people that the empty shelves in the ration shop at Damcherra are due to the fact that the chief minister of Tripura had removed ten tonnes of rice from this ration shop and, accompanied by the ration shop dealer, had taken a helicopter ride to Mizoram to distribute this rice to the voters there as a part of the Congress(I)'s election campaign in the state. The wheeling and dealing allegedly indulged in by the ration shop dealer because of his high political connections does not seem to be a fabrication because he has amassed a huge fortune far in excess his legal earnings.

Be that as it may, the fact remains that unable to bear their near-starvation condition any more, about six to seven hundred starving tribals of Damcherra and surrounding villages, irrespective of their political affiliations, had staged a spontaneous march to the Damcherra police station (the only government office in the area) at 11.00 a m on July 27 to ask for free rice to feed themselves and their starving children. Although no political party had organised the rally, a local TUJS leader took the responsibility of acting as the mouthpiece of this motley crowd. The OC of the police station, pleading his inability to meet their demand, sent a radio message to the SDO at Dharmanagar and the DM at Kailashahar asking for instructions. He received a wireless message from the SDO of Dharmanager giving an assurance that men would be sent to Damcherra within two to three hours. The hungry crowd then slowly moved towards the Damcherra food godown after requesting the police authorities to register their names for the issue of two kgs of rice per head and waited patiently for the SDO's men to bring them relief. It was only at 5.30 p m that help came to the starving people in the form of a truck load of stengun and SLR weilding CRPF men under the leadership of the SDPO. On seeing the kind of help that had been sent, the waiting crowd naturally became upset. It is possible that a few stones were thrown at the armed men and attempts were made by some hungry women to break open the doors of the godown as the crowd was at the end of its tether. The CRPF retaliated brutally by suddenly attacking the women with rifle butts and then firing indiscriminately on the unarmed and fleeing crowd with the intent to kill. This is obvious from the fact that most of the injured and the dead were shot in the back and not in the leg. The firing was not preceded by a lathi charge or the bursting of tear gas shells.

While talking to pressmen at Calcutta airport on his way back to Agartala from Delhi, the chief minister justified the action of the CRPF, claiming that there was no alternative but to fire on the mob which was intent on murdering the paramilitary and police personnel under the leadership of the CPI(M). He did not even care to find out what had actually happened at Damcherra when he was away in the capital. It is believed that Nagendra Jamatia, the TUJS minister in the coalition ministry, who was the acting chief minister, had ordered the firing on the starving and unarmed tribal men and women though his party ostensibly upholds tribal interests.

A disinformation campaign was also cleverly mounted by the government against the CPI(M)-dominated ADC for the chronic food shortage prevailing in the Damcherra area, although providing work to the people and food in the ration shops, in the ADC areas, falls within the jurisdiction of the state government. Moreover, the ADC has been drawing the attention of the state government to the acute food crisis prevailing in the Kanchanpur area and has been taking measures to ease the situation within its limited powers.

Never before in the history of Tripura has such a cold-blooded murder of innocent and starving men and women taken place for the 'crime' of wanting food. The Left Front as well as the TUJS and the TNV supremo, Bijoy Warangkhawl, are all demanding a judicial enquiry into the incident. The guilt of the government is proven, not only by its action in the house on the first day of the monsoon session of the assembly, but also by the fact that it is dead set on covering up the incident with a magisterial enquiry conducted to safeguard the interest of the government and hide the truth.

Worsening Balance of Payments

The persistent strains in the balance of payments reflects the incapacity of the economy to reduce the import surplus not by curtailing investment and the level of economic activity but by raising the rate of domestic saving.

THE current account deficit on India's external payments which had widened to Rs 5,030 crore in 1986-87 from Rs 2,317 crore in 1981-82 deteriorated further to Rs 6,293 crore in 1987-88, according to the latest annual series on balance of payments statistics published by the Reserve Bank of India in its April 1989 *Bulletin*. The data are stated to have been presented in a 'revised format' but nowhere has the nature of the revision been explained except for a footnote to the effect that "some more details have been provided with effect from October 1984 issue of the *Bulletin*". How does the inclusion of additional information amount is a change in format?

In relation to the Gross Domestic Product the balance of payments deficit now stands higher at 2.1 per cent, having risen from 1.6 per cent in 1981-82.

The widening of the deficit was brought about by a decline in the net invisible receipts from Rs 3,524 crore to about Rs 3,000 crore in 1987-88, even as the deficit on merchandise account narrowed to Rs 9,296 crore from Rs 9,354 crore, reflecting a slightly faster rise in exports. The value of imports on government account during the year was higher than that on private account. However, compared with the level in 1981-82, value of imports on private account showed a spectacular rise from Rs 5,257 crore to Rs 12,643 crore or by about 140 per cent (see table). The imports on government account rose by 51 per cent in the same period. Yet the balance of trade on private account showed a higher surplus of Rs 3,753 crore than Rs 1,918 crore in 1986-87. Thus the deficit on trade account continues to be made up of increasing imports on government account.

The major support to the balance of payments is provided by 'private transfer payments', an important invisible item on the current account. These receipts are predominantly repatriation of savings and remittances for family maintenance by Indian nationals abroad. The net receipts under this head were Rs 3,498 crore in 1987-88, up from Rs 2,976 crore in 1986-87 or Rs 2,221 crore in 1981-82. Investment income, which is largely in the nature of interest and discount on foreign exchange reserves held by the RBI slipped to a deficit of Rs 1,249 crore in 1986-87 and of Rs 1,734 crore in 1987-88. This item was in surplus to the tune of Rs 339 crore in 1981-82, although foreign exchange assets held by the RBI at that time were lowest in the past 12 years at Rs 3,354 crore. The negative position that has emerged in recent years is largely on account of higher outflow of interest and charges to the IMF, on loans received as part of external assistance, on external commercial borrowings by Indian enterprises and on FCNR deposits. As the details on the capital account reveal, there has been a marked rise in liabilities due to inflow of capital on both private and official account, entailing larger investment income payments. Net receipts on account of tourism was higher at Rs 1,368 crore as compared with Rs 1,236 crore in 1986-87. Net income from transportation which includes freight on exports, remittances received from Indian steamship/airline companies and Indian branches of foreign steamship/airline companies, etc, was in deficit to the tune of Rs 246 crore as compared with Rs 60 crore in 1986-87.

The capital account of the balance of payments indicates the manner in which the deficit on the current account is funded. The capital account also throws light on transactions relating to India's foreign financial assets and liabilities. The data are classified into three broad sectors: (a) private, (b) banking, and (c) official. There has been a significant rise in the capital inflow on private account in recent years. Between 1981-82 and 1987-88, the rise in such inflows was from Rs 118 crore to Rs 2,238 crore.

Larger long-term loans to private enterprises and institutions, commercial loans raised by the non-financial private sector, commercial borrowings of non-banking financial institutions such as the ICICI and deposits received under the Non-Resident (External) Rupee accounts and Foreign Currency (Non-Resident) accounts (excluding interest payment on them) are the major factors responsible for the sharp jump in net capital inflows on private account. Net inflow of official capital representing loans and credits granted by foreign governments and international institutions to government of India and state governments, external borrowings by public sector undertakings and loans from the IMF Trust Fund was also sizeable at Rs 6,831 crore as against Rs 1,257 crore in 1981-82. With regard to the liabilities to the International Monetary Fund there was repayment to the tune of Rs 1,209 crore in 1987-88 in contrast to net drawal of Rs 602 crore in 1981-82.

It may be parenthetically pointed out that the changes in the balance of payments position presented here in terms of rupee values are exaggerated both on the credit side and the debit side by the significant depreciation of the external value of the rupee. Between 1981-82 and 1987-88 the Indian currency fell against the dollar by 32 per cent, the pound by 33 per cent and the German and Japanese currencies by 50 per cent and 65 per cent respectively.

Many dark areas are discernible in India's external payments scenario. Faster rise of imports (140 per cent in the past six years) than of exports (111 per cent) on private account together with the rise in imports on government account have led to a 52 per cent rise in the trade deficit which was about 3.2 per cent of GDP at current prices, with imports around 9 per cent of GDP and exports about 5 per cent. Higher imports with a depreciating rupee have added to domestic inflation and raised the cost structure. This experience should serve to emphasise that an exchange rate depreciation is not the short-cut to achieving and maintaining a competitive position in world trade that it is often thought to be. The support provided by the surplus on the invisible account is rather tenuous as it is largely based on private transfers and to some extent on tourism. There is now a net outgo of foreign exchange on account of all other current account transactions. The rising net outflow on 'investment income' account is indeed especially worrisome. This seems to be the combined effect of the progressive substitution of low cost official capital with high cost private capital (including foreign currency deposits) and the decline in the level of foreign exchange reserves.

The balance of payment deficit is equal to the excess of domestic investment over saving. In the larger context, the persistent strains in the balance of payments reflects the incapacity of the economy to reduce the import surplus not by curtailing investment and affecting economic activity but by raising the domestic savings rate, creation of surpluses of exportable commodities and import substitution.

TABLE: CURRENT ACCOUNT OF INDIA'S BALANCE OF PAYMENTS

	1981-82	1987-88
I Merchandise Account Deficit (a − b)	−6121 (4.2)	−9296 (3.1)
(a) Exports	7765	16396
Private	7765	16396
Government	—	—
(b) Imports	13886	25692
Private	5257	12643
Government	8629	13049
II Invisible Surplus (a − b)	+3804	+3003
(a) Receipts	5812	9278
(b) Payments	2008	6275
III Current Account Deficit (I + II)	−2317 (1.6)	−6293 (2.1)

Note: Figures in brackets are percentages of GDP at current prices.

Humbling the Mighty: A Small Beginning

Sujit K Das

Due to pressure from various national and international campaigns, the government of India banned 25 categories of drugs in 1983. Affected companies obtained stay-orders from different high courts and continued to market their harmful drugs.

COME, let's boycott these five anti-social drug companies. This slogan took shape after the All India Drug Action Network (AIDAN), a national platform of drug action groups, decided to launch a boycott campaign against recalcitrant drug companies who are bent upon marketing unscientific hazardous drugs which were banned by the government of India (GOI). Drug Action Forum, West Bengal (DAF), a constituent of AIDAN, has not limited this boycott-call to mere press statements. DAF has approached various organisations of the medical profession, mobilised the grassroots organisations of people's science movement and health movement, motivated a number of trade unions, and spread the message over the state of West Bengal with posters, leaflets, street corner meetings, etc. The campaign quickly gained momentum and made tangible impact. But let's briefly recount the sequence of events, to provide the context.

Background

Though medical science recognises about 500 drugs, the Indian market sells more than 60,000 items of drugs. Unbelievable but true. Due to pressures from various national and international campaigns, the GOI banned 25 categories of drugs in 1983, on the ground of these being irrational and hazardous. A few affected companies obtained stay-orders from different high courts and continued to sell their harmful drugs. Meanwhile in the same year, a public interest litigation had been filed by a lwayer, Vincent Panikulangara, in the Supreme Court demanding banning of all drugs identified as irrational by the statutory body, Drug Consultative Committee. True to the spirit of the Indian judicial system, the cases in the high courts and Supreme Court dragged on. When the latter case was eventually taken up for hearing in November, 1986, the Supreme Court expressed its shock and indignation at this inordinate delay. Justice R N Misra asked the GOI, "What steps are you taking to show your concern for public health? So long as you were not aware it is alright. Thereafter it is murder."

The justices of the division bench expressed surprise that 'the high courts should have granted stay orders in such matters' and came down heavily on the union ministry of health, the Medical Council of India, the Indian Medical Association and the drug controllers of states, observing that they have, 'betrayed complete lack of interest in public health and welfare' by not filing any reply for over three-and-a-half years since the court notice was served on them.

After speedy hearing, the Supreme Court delivered its judgment on March 3, 1987: A few relevant comments from the judgment:

> We must at the outset clearly indicate that a judicial proceeding of the nature initiated is not an appropriate one for determination of such matters... The technical aspects which arise for consideration in a matter of this type cannot be effectively handled by a court. Similarly the question of policy which is involved in the matter is also one for the union government—keeping the best of interests of citizens in view to decide. No final say in regard to such aspects come under the purview of the court... We would like to indicate that it is for the government on the basis of expert advice to decide whether use of poisonous medicine may not be reduced; afterall administering the warning is not a sufficient excuse to circulate poison by way of medicine.

Referring to the government ban orders remaining inoperative on account of injunctions granted by high courts, the judgment said:

> We have, therefore, thought it proper to suggest that the central government may get impleaded in the pending proceedings, if they are already not parties and apply to the high courts. We sincerely hope that when any such application is moved before the high court where a dispute of this type is pending, the high court would make every endeavour to expedite the disposal of the proceedings and have the same disposed of as early as possible and preferably within a period of two months from the date when it is approached so that the dispute may end. If there be any difficulty in giving effect to this part of the judgment, the central government has leave of this court to make an appropriate application for directions.

Present Case

In November 1986, the GOI, announcing certain new measures in its revised drug policy, said that,

> Among other things it would go into the question of rationalisation of existing formulations in the market including the banning of formulations of harmful nature and better control over introduction of new drugs

and disclosed that one of the measures would be 'banning of non-essential and harmful drugs'. Accordingly in October 1987, the 'sub-committee to weed out irrational/harmful formulations' proposed banning of 12 categories of drugs and held hearings with the concerned drug companies giving them ample time and opportunity to make their defence. In November 3, 1988, the GOI banned two categories of drugs—fixed dose combination of chloramphenicol with other drugs and fixed dose combination of corticosteroid with other drugs—on the grounds that these drugs have no therapeutic justification and their use is likely to involve risk to human beings. These two categories of drugs are sold in the market in a few dozen trade (brand) names, each company selling its product under its own fancy name. Five drug companies, viz, Dey's Medical, Roussel, Mac Lab, Lyka Lab and Indoco Remedies promptly obtained stay orders from different high courts and continued marketing. True to their earlier conduct, the drug control authorities of the central and state governments have not shown much enthusiasm in fighting the cases in the courts during the last nine months. Finding no other way to save the lives of innocent consumers, the drug action groups have called for a boycott of all products of these five companies until they stop marketing their harmful drugs.

Why Banning?

Fixed dose combination of chloramphenicol with streptomycin (CS) is recommended by the sellers for the treatment of diarrhoea and all sorts of gastro-intestinal infections. The leading brands are Enterostrep, Lykastrep, Chlorostrep, Streptoparaxin, etc. Fixed dose combination of corticosteroid with other drugs (CX) is promoted for umpteen varieties of ailments including asthma and allergic disorders. The leading brands are Cortasmyl, Betneton, Histapred, Perideca, etc. All these formulations are neither mentioned nor recognised as 'drugs' in the text books of medical science and hence, are not taught to the medical students. These are the inventions of the traders who teach the doctors about its virtues. CS is not effective against diarrhoea; chloram-

phenicol can cause aplastic anaemia, a fatal side effect; indiscriminate use of chloramphenicol may lead to drug-resistance of micro-organisms which might and do cause fatal epidemics. That is why, in medical science, chloramphenicol is strictly recommended for use against only typhoid fever and certain other uncommon infections which do not respond to other anti-infectives. CX is also an unscientific drug, not recognised by medical science. Corticosteroid is a very useful drug, often life-saving, but causes serious, sometimes irreversible, side effects. When combined with other drugs, patients are frequently administered those other drugs with simultaneous consumption of corticosteroid though the latter is not needed. Hence corticosteroid is never recommended for use in fixed dose combination with any other drug. In India, there is no system of reporting or recording adverse reactions from drug consumption, but even then adverse reactions due to CS and CX have already been reported and widely known in academic circles. Hence, the ban.

Impact of the Campaign

Two years ago, DAF sent an appeal signed by 270 doctors to 52 drug companies to stop marketing of CS. Only two multinationals—Parke Davis and Boehringer-Knoll—responded by withdrawing their brands of CS (Chlorostrep and Streptoparaxin respectively) from the market, but the Indian manufacturers simply ignored it. Soon after the present boycott launched by DAF, representatives of Dey's Medical Company met DAF and appealed that since Dey's Medical is a Bengalee company and DAF also being a Bengalee organisation, the boycott campaign should stop; Bengalees should not jeopardise the vital interest of fellow Bengalees. Being unable to persuade DAF with such argument and alarmed at the adverse effect caused to the business as DAF's campaign gained momentum, Dey's Medical served a legal notice on DAF in July, 1989 stating that unless DAF immediately stops the campaign, the company 'shall be left with no alternative but to seek legal remedy including claim for heavy damage'. Undeterred, DAF has intensified the campaign. On the credit side, however, Mac Lab (CS) and Indoco Remedies (CX) have informed that they have stopped marketing their harmful products and DAF has exempted them from the boycott. Lyka Lab (CS) has informed that they have stopped manufacture but is continuing the sale with the object of clearing the accumulated stock. Boycott of Lyka Labs is continued. Roussel has not yet responded.

Quo Vadis?

A simple action of banning of harmful pseudo-drugs and thus getting rid of a constant threat to the lives of masses of unsuspecting people has now turned into a very complicated matter. Consider the roles of different parties. In the context of the judgment of the Supreme Court referred to above, the high courts' action in issuing stay orders appears to be patently injudicious. Even ignoring the said judgment, the high courts' decision is exceptionable. When a doubt is raised regarding the safety and efficacy of any consumer product—and more so in case of drugs, what does a sensible person do? Use of the commodity is stopped forthwith and then investigations are conducted to find out the truth. Only after it is established that the doubt is baseless and the commodity is safe, consumption is resumed. But what the high courts did was to remove the barrier against circulation of the drugs whose safety and efficacy has been questioned and have thereafter allowed the contending parties to argue their cases to decide whether the drugs were really safe or not. One pertinent question has been raised in concerned circles: will the honourable judges or for that matter, the management personnel of the concerned companies now dare to consume these drugs themselves or recommend these for their relatives? Be that as it may, let us face the reality. The drugs, which are not recommended by the text books of medical science nor taught to the medical students, which do not find any place in the WHO list of essential drugs, which defy all principles of rationality, which are found to cause fatal side effects, which are not registered for marketing or sale in any country where a comprehensive drug legislation is implemented, and which are banned even in Sri Lanka, Pakistan, Nepal, Bangladesh, etc, are allowed to be sold here in India with the aid of the judicial process. Other abetting parties are the authorities of the central and state governments. These authorities issue licence to unscientific drugs, then, under pressure from scientific opinion, ban those drugs, and show extreme reluctance to fight legal battle when the ban-orders are rendered ineffective by stay-orders of courts. In the context of the above-mentioned Supreme Court judgment, the GOI's reluctance to take the matter over to the Supreme Court is also inexplicable, unless one suspects that the state bureaucracy is in league with the machinations of the drug companies. The medical profession is also a party to the crime. The conduct of the medical profession in the matter of promoting unscientific harmful drugs is scandalous, to say the least. The medical profession not only provides legitimacy to unscientific drugs but, in general, acts hand-in-glove with the unscrupulous drug companies in subjecting innocent patients to fatal risks for sheer commercial gain. Even now, leading personalities of the medical profession shamelessly represent drug companies in public forums. The moral degeneration of the profession will be apparent from a single example. A leading gynaecologist of national repute defended one drug company's stand against banning of the dangerous drug E-P Forte in a public hearing, though in the popular text book on Gynaecology authored by him, E-P Forte has not been recognised as a drug. It is only recently, that consumers have ceased to remain mere silent-victims and come forward to fight for their rights. This boycott programme has no precedence except one abroad when, a few years ago, the medical profession in the Scandinavian countries boycotted Ciba-Geigy and forced the multinational to concede defeat. Boycott appears to be the last resort available to the drug action groups, to protect the lives of the consumers. DAF, however, has not envisaged the boycott programme to be taken up and faithfully implemented by the entire medical profession, nor does DAF expect to carry the message through to the vast number of consumers. The expectation is limited and it has borne fruit. Two companies have already retreated, a good number of doctors have been persuaded to see reason and join the boycott programme, a hue and cry has been raised by the mass media, particularly the news dailies, and the authorities are facing embarrassing questions. The mighty drug companies and powerful forces like the government and medical profession now see that the days of their unchallenged reign are gone. The drug industry will, henceforth, face exposure and resistance, and its happy hunting ground of profit-making at the cost of human lives is now under threat. It is a lesson for all social action groups to learn. A note of caution, however. It is only the beginning. Even if the present boycott programme fully succeeds, the struggle does not end there. The Indian market sells numerous unscientific harmful drugs.

Workers, Unions and 'Sick' Industries

A Case

Basudev Ganguly

The story of how owners and unions colluded behind the backs of the workers to liquidate a 'sick' industrial unit, in the process contravening the Calcutta High Court's explicit directives.

ONE of the biggest aluminium fabricating companies in this part of the world used to be Aluminium Manufacturing Company (AMCO) situated at 2 Jessore Road, Dum Dum, Calcutta. Some 1,100 workmen were working in the company on May 13, 1984 when it was closed down. In July 1986 the Industrial Reconstruction Bank of India, the United Commercial Bank and the State Bank of India appealed to the Calcutta High Court to permit sale of the company's movable and immovable assets to enable them to recover their dues. In response to the appeal the court arranged for the company to be auctioned by notice.

On July 3, 1987 a company called Oriental Sales Agency (which had been floated just on May 12, 1987) bought AMCO with a bid worth Rs 1.5 crore which had been actually lower than another offer of Rs 2 crore made by Amar Steel Industries. Justice Manjula Bose of the Calcutta High Court accepted OSA's offer because it agreed to all the conditions imposed by the court. In the court's own words, "the court made it clear to all the intending purchasers who appeared before the court that the sale was to be for the purpose of running the factory in as much as the workers' interest was required to be kept intact and the factory could not and would not be allowed to be dismantled for the purpose of selling the same in pieces and/or lots".

Though ostensibly OSA agreed to the court's stipulation and bought AMCO on July 3, 1987 promising employment to all workers who had been on the payroll on the date of closure in 1984, what followed is a completely different story. OSA has dismantled AMCO's plant and machinery and demolished the factory sheds and buildings precisely to sell them "in pieces and/or lots". Today in place of the giant factory sheds of AMCO there is left only a wide open ground. 1,100 workers have gone under; more than 50 have already died from hunger or have committed suicide, behind this tragic denouement lies not only OSA's greed but also the betrayal of the workers by the so-called Joint Action Committee, a joint body of CITU and INTUC.

AMCO was a British company established in 1922. The British Aluminium Company sold this factory with sheds and machinery to Purusottam Das Pasaria, supposedly for just Rs 1 lakh, in 1968. Pasaria had the money but he did not seriously intend to run an industrial unit like AMCO. All the same he was allowed to borrow Rs 30 lakh by the UCO Bank between 1968 and 1970 on the plea of modernising AMCO's plant. He did nothing of the sort. A decade later the company's dues to the UCO Bank taking principal and interest together, amounted to Rs 129 lakh. Much before that, in 1971, Pasaria had offloaded the company to the Industrial Reconstruction Corporation of India (IRCI) as he thought the company had been made enough sick and it was time to evade any responsibility of repaying the huge loan.

The IRCI, on the basis of the report of an enquiry committee appointed by it, considered AMCO worth taking over as the committee had found that the company could become viable if it were run by an efficient management. Between 1972 and 1981 the IRCI sanctioned Rs 377 lakh to AMCO in instalments. Except for an amount of Rs 8 to 10 lakh for building the forging plant and partially modernising the tool-room, the rest of the money was given as monthly doles. There was no scarcity of orders, but the management never cared to find out why the company was not doing better, nor did the IRCI seem to bother for 10 long years, even though an enquiry committee formed with representatives of banks and other financial institutions had submitted its report in 1979.

The IRCI always tried to pin all responsibility for the non-viability of the company on the workers and so it kept ordering the management to reduce the workforce, once in 1974, then in 1976 and finally in 1980. In 1980 the IRCI announced a voluntary retirement scheme under which those who retired would be given a maximum of 10 months' wages and one of the retiring employee's wards would be given a casual job. Some 65 workers opted for the scheme and though they were given their financial dues, no wards of theirs were taken into the casual workforce. Finding the response to the scheme not encouraging, the IRCI conducted a secret enquiry in 1980 by a company which did not visit the factory or talk to workers' representatives to judge the real situation in the company. Nonetheless the enquiry came up with the finding that some 400 workers were surplus and the productivity of the remaining workers had to be increased.

The earlier enquiry report of representatives of banks and financial institutions had viewed the situation differently. It had found that AMCO could be made profitable if it could be relieved for five years of paying interest on the large sum borrowed by P D Pasaria before the takeover by the IRCI. The IRCI did not pay any heed to this suggestion. The director-in-charge of AMCO expressed optimism in different letters and reports that there was no dearth of orders and that if production rose to Rs 30 lakh per month AMCO could come out of the red. AMCO had its own design office, modern tool-room for making sophisticated dies and other accessories, skilled manpower and a well-equipped plant. Tatas and Jessop relied on AMCO for their non-ferrous casting jobs nearly all the year round. AMCO was well placed to take on job-work for railways, defence, shipping, the aviation industry, etc. But in a letter of November 30, 1981 to IRCI, the director-in-charge of AMCO stated that the company had lost an order for Rs 1 crore from the ordnance factory, Kanpur, because of lack of funds and many more orders worth crores of rupees could not be accepted because of the same reason.

Finally, the IRBI (IRCI's new name) declared the closure of AMCO on May 13, 1984 and washed its hands off all responsibility for the 1,100 workers' lives. And in 1986 it went to the Calcutta High Court for recovering the money it had so far spent on AMCO.

In the second act of this drama, AMCO was put up for disposal by auction. In all 10 offers purporting to purchase AMCO were received by the joint receivers, but only three were valid as they were accompanied by the required draft for Rs 5 lakh. Among the three bidders Amar Steel Industries offered the highest bid of Rs 2 crore "but the court did not accept the said offer inasmuch as the court considered the interest of the workers to be of paramount importance and a matter to be considered along with the interest of the company. Inasmuch as it was the hard labour of the workers which had created the company to exist all three years, now that the company faced closure, it would not be right to throw them out on the street." Now, Oriental Sales Agency jumped at the opportunity

and pretended to accept the court's terms. The court accordingly passed an order in favour of OSA stipulating that the purchaser had "to re-employ all the workers who had been on the payroll" and further that OSA will "consult both the unions' representatives and will try to take expeditious steps to see that the workers are able to settle down as soon as possible and the factory is opened as expeditiously as possible". But that expeditious moment never came.

In fact OSA had fooled the court by suppressing the fact that it had already consulted both the unions' representatives and reached an agreement with them without even waiting for the court's order. OSA proceeded to dismantle the plant and machinery and the factory sheds, structures and buildings and to sell them as scrap. This constituted contempt not only of the high court but also the Supreme Court because the banks and the IRBI had gone to the Supreme Court in appeal against the decision of the Calcutta High Court and the Supreme Court had upheld the high court's decision.

What was the role of the unions during this period? The AMCO Employees Joint Action Committee had done virtually nothing after the factory's closure except for taking out a lone procession and holding a few meetings at the Dum Dum town hall. When in 1986-87 the AMCO case was referred to the high court the unions' interest was re-kindled. In the beginning of 1987 the news was spread by the unions among the workers that a Punjabi capitalist was going to invest Rs 350 crore in West Bengal starting with AMCO and the Motor and Machinery Company, Dum Dum. In this way the union began building up the image of Oriental Sales Agency as a potential saviour of the company in the minds of the workers, though OSA had not even been born then. OSA was registered as a private limited company on May 12, 1987 with an authorised capital of Rs 56 lakh but a paid-up capital of Rs 1.50 lakh only, contributed by three persons, Anup Dhar, Jayaprakash Bansal and Radheshyam Agarwal. And what is most astonishing, OSA and the unions had already signed an agreement on June 16, 1987—more than a fortnight before the auction held by the Calcutta High Court. The existence of this agreement was suppressed before the court.

The unions had led the workers to believe that when OSA took over AMCO, it would pay back-wages of 10 months and all workers below 55 years would be re-employed. Actually OSA's agreement with the unions specifically stipulated that "in the event Calcutta High Court accepts offer of the purchaser and confirms the sale of the entire assets... the said union, in consideration of Rs 66 lakh paid by the purchaser to the said union, as and by way of compensation to the ex-workmen, will make over vacant and peaceful possession of the entire assets... without any claim, demand or disturbance and the said union will also assist and render all co-operation to the purchaser..." This is the part of the preamble to the agreement. The agreement laid down very precisely that upon payment of the first instalment of compensation, the purchaser would be entitled to remove old finished and semi-finished goods including raw materials lying at the factory premises; that on payment of the second instalment the purchaser would be entitled to remove old, obsolete/dilapidated and junk plant and machineries lying in the factory premises; that on payment of the third instalment "the purchaser shall be at liberty and have the right to demolish and dismantle all the buildings, factory, sheds and structures"; and finally that the union "will see that no person creates any nuisance and/or obstruction in and around factory premises at the time of dismantling and/or demolishing the buildings, factory and sheds and structures and re-building of the same and/or running any goods, plant and machinery from the factory premises" and that the union "will see that after payment of compensation money as afforesaid, nobody shall make any demand or claim of any nature from the purchaser for any reason whatsoever".

It is thus clear that the OSA and the unions had determined in advance what they would do after taking possession of the company's assets. The agreement was signed on behalf of the unions by Subhash Chakraborty, a minister in the West Bengal Left Front government, Lal Bahadur Singh, state secretary of BPNTUC, and Ajit Chowdhury, secretary of the CITU at the AMCO factory. It was alleged that Subhash Chakraborty used his political influence to push through the arrangement. Significantly, the news of AMCO's sale to OSA was publicised prominently in *Ganashakti*, the Bengali Daily of the CPI(M), which described it a great opportunity for AMCO workers. And now AMCO is a piece of vacant land.

A large number of workers and a few dissident CPI(M) members, it must be added, have been fighting against this conspiracy. They tried to prevent OSA from demolishing and dismantling the AMCO factory and removing materials from the factory premises. These workers have formed the AMCO Workers' and Employees' Solidarity Committee and through it they have got a stay order on June 5 this year from the Calcutta High Court which pronounced that "the court is disinclined to pass any order save and except the court makes it clear that the factory has been sold for the purpose of running the same as a going concern and the assets of the factory for the purpose of running the same should not be dismantled".

But in the two years since the factory was sold the damage has all been done. AMCO has disappeared as have the workers' jobs.

Micro-Organisms, Bio-Technologies and Environmental Protection

N N Mehrotra

Cases of deaths in neonatal and paediatric wards due to hospital acquired infection are not rare. Little concern is exhibited with regard to the safe disposal of hospital generated wastes which are highly toxic and infectious.

THOUGH mankind has for centuries been using micro-organisms, plants and animals to produce food, beverages and other material, new techniques of genetic manipulation have offered great potential for their mass-scale utilisation in many more areas. Thus, the development and application of these techniques of 'new' bio-technology (BT) are likely to have considerable impact on a large number of commercial products and processes in areas ranging from medicine and agriculture to processing industries and manufacturing. Simultaneously, however, these may also pose certain environmental and health risks. On the other hand some of these technologies can also be utilised for environment management/improvement. New BT is therefore like a double edged weapon where one has to be conscious of the following facts: (i) Whether some of these 'new' micro-organisms, plants or animals, if released in the environment could proliferate indiscriminately to cause negative impacts. (ii) Whether some of the powerful new substances produced through BT could also prove harmful?

While we already have a reasonable number of units using industrial micro-organisms (distilleries and fermentation units including those involved in antibiotics production) our environmental legislation has not shown any specific concern for the above. Besides, there are a large number of R and D centres and research units which often employ many of these micro-organisms and bio-technological products with little concern for health and safety of its workers or of the environment around. Some of these laboratories do use highly pathogenic organisms and viruses also. While the purpose of this paper is not to create horror in the minds of the people as well as the policy planners, it may be better to have preventive consciousness regarding accidental or deliberate release of living micro-organisms and other safety aspects on the use of biotechnologies and its products. Not only the public, but even the scientists at large seem to be either complacent or over-enthusiastic about the use of such technologies. An informed debate on such aspects is necessary in the relevant quarters.

There have been some studies in the western countries about health risks due to exposure of such research workers [1 and 2] and about the risk of using biotechnologies [3, 4, 5, 6 and 7]. However, despite an increase in biotechnology reserch and development activities in India in the last decade, sufficient concern has not emerged about the health and safety aspects. Though there have been occasions in the past where international companies [8] and organisations like WHO are reported to have been involved in research with health and security implications (e g, research on genetic control of mosquitos), no clear guidelines seem to have been developed for regulation of research in such sensitive areas. Even the newly proposed Environment (Protection) Act, 1986 is not adequately concerned with such issues since the micro-organisms (or other bio-technological products) do not find any specific mention either in the definition of environment pollutants or of hazardous substances. The research laboratories or R and D centres also do not find any specific mention in this regard and hence remain unaffected by any proposed regulations.

The National Biotechnology Board did prepare some guidelines in 1983 to be voluntarily followed by the laboratories involved in recombinant-DNA work. A fresh draft of guidelines has been prepared by a committee of the newly created Department of Biotechnology (DBT) which are being finalised. Though these committees have been constituted in several institutions, no assessment of their role so far, is available. However, it is expected that the Prevention of Food Adulteration Act (1954), Drugs and Cosmetics Act (1940) Industries Act, Poisons and Toxins Act, and Insecticides Act (1968) will continue to take care of various regulatory aspects. Thus, for example, genetically engineered microbial pesticides will still be registered with the Central Insecticides Board. Though they may seek some additional toxicity and other data on these agents, inadequate assessment (by these agencies) of the complex nature of risk may not be able to bring out appropriate results.

Institutions Causing Microbial Hazard

For the purposes of simplicity establishments that pose the threat of microbial and biotechnological pollution can be divided into three categories. This classification may also help in the impact assessment of their respective problems in a clearer way.

I

Industries Involving Micro-Organisms and BT Products

Some of the major industries using micro-organisms are antibiotics producing units, distilleries or those involving fermentation for production of other chemicals. Besides increasing BOD through the discharged effluent, untreated discharge from antibiotics plants, for example, can create a problem of development of antibiotics resistant species of micro-organisms due to the presence of small quantities of the antibiotics in the discharge. The problem of high BOD or increased (and acquired) secondary infections in the fauna downstream of the discharges has to be faced in other plants. Health and safety considerations (including potential risks) of the workers in the new BT companies has been a concern the world over. Though the country as yet does not have industrial units involving genetically engineered micro-organisms, the day may not be far when industrial units start discharging such micro-organisms into the environment. Special precaution has to be taken to ensure 'no leakage' of sensitive plasmids like Ti, or bugs producing larger quantities of toxins or other pathogenic material (necessary for vaccine preparation, for example) in the environment. Similarly, the introduction of new bio-insecticides, pesticides and herbicides or those of monocultures of plants at the industrial level may have impacts on ecological balance.

Though most of these problems may come under the ambit of the water, land or air pollution control acts, any effective control of such pollution will require a better (and often technical) expertise and appropriate risk and impact assessment strategies.

II

Hospitals, Nursing Homes and the Like

Cases of deaths in the neonatal and paediatric wards of even the best of our

hospitals due to 'hospital acquired infections' are not rare. Though the concerned authorities often do take steps, the question of the requisite speed and efficiency of these steps can often be raised. Another aspect of our hospitals of which little concern is exhibited relates to the safe disposal of waste generated. Thus, many well equipped hospitals are not careful enough in disposing their highly toxic and infectious wastes, generated from dressings, placentae, umbilical cords, aborted foetuses, surgically removed tissues and organs and such other material. Increasing use of disposable plastic syringes and needles, etc, generates equally large heaps of infected material alongwith other plastic catheters, blood and glucose transfusion bags and such other material harbouring infections.

At the moment there seems to be no specific central act or guideline to ensure safe and decontaminated disposal of all such waste. Specific rules may be required for implementation by various levels of hospitals, starting from primary health centres and maternity homes to big referral hospitals having hundreds of beds. There also have to be specific legislations for a large number of private abortion clinics and nursing homes.

III

R and D Institutions in Biological Science Research

A large number of research departments in universities and laboratories in R and D institutions use the following category of hazardous chemicals and micro-organisms which are also released in to the environment.

(a) Radioactive chemicals;
(b) Hazardous chemicals like Benzene and Toluene, explosive and corrosive chemicals (including mineral acids) and other toxic chemicals;
(c) Pathogenic and not so pathogenic micro-organisms;
(d) Infected and non-infected animals, insects, etc; and
(e) Recombinant DNA incorporated micro-organisms.

While scientists, technicians and other laboratory staff as well as the environment around them run the risk of health hazards, no legislation or regulations exist in the country either on the use or transport of most of these substances, except in the case of radioactive chemicals. Even in the case of radioactive chemicals the only restriction is from the Bhabha Atomic Research Centre which certifies a user (individual or laboratory) of its capability to use (handle) such substances and also provides services for screening of the exposed testing films to ensure limited exposure of those involved with such work. While it does organise supervision of such working facilities (mostly on request), it rarely conducts any surprise monitoring of such laboratories. The scientists are, however, free to import such radioactive substances from abroad which are available to scientists without any restrictions. Even for transport (or postal despatch) of such substances, no specific guidelines are followed.

On the other hand, no guidelines or legislations exist for safe handling including transport and/or disposal of other categories of substances and micro-organisms. Details of various categories of micro-organisms and the type of problems that these can create have been prepared by agencies like National Institutes of Health, USA, OECD, etc. Since the biological sciences research is being boosted in the country (including the setting up of a department of Biotechnology in 1986), it is appropriate that early action is taken on such important matters of health risk of researchers as well as environmental risk in general.

International Approach to BT Regulation

International concern for regulation of bio-technology arose from public fear and speculations regarding unknown risks associated with its use or the ethical considerations of issues like 'gene therapy' or introduction of cloned animal (or even human) species. However, potential excessive regulation of the BT industry was found to have a likely adverse impact on long-term economic stability of this growing industry on one hand and the concern for international competitiveness, on the other. This was particularly important in light of the fact that large investments were already made in this nascent industry without having any significant returns in terms of new products. Thus, for example, the US's Domestic Policy Council Working Group on Biotechnology recognised the need for regulations that protect the environment, but at the same time, do not excessively hinder the domestic biotechnology industry in its ability to compete in the international market place. The effort therefore is to achieve international harmonisation of the BT regulations. In particular, efforts have been made in this regard by both the OECD and EEC countries, besides UN organisations namely UNIDO, WHO and UNEP, etc [5, 6 and 7]

So far as individual countries are concerned, the approach taken by different countries varies considerably in scope complexity and degree of comprehensiveness. Various countries have, therefore, developed specific legislations, regulations or guidelines depending upon the attitudes of their people (particularly the policy makers and those groups who influence them) towards the issues of risk and safety, regulations on health, safety and environment, national policies on research, technological and industrial development or ethical aspects of BT. Thus, according to a comparative study, significant involvement by industry and academia was observed in the development of guidelines and regulations in a few major competitive nations of the world[9]. According to this study, Japan appears to be the leader in developing and promulgating biotechnology-specific regulations and guidelines 'and will continue to be active in this area'. France, on the other hand, was not found to be taking an active approach to regulation of BT. This was also corroborated by my personal discussions with a large number of leading biotechnologists and biotechnology-based firms in France. While several Japanese ministries have been addressing issues of jurisdiction and co-ordination in this regard, France and FRG were less concerned about them. Within EEC countries a Biotechnology Inter-Service Committee has been constituted to formally represent these issues. In the US, a co-ordinated framework has been developed for regulation of BT, involving various departments and agencies [10].

Since little data is available on impact assessment of biotechnologies and its products, most government policy-makers and regulators depend upon the affected industries themselves to provide scientific and technical advice on these matters. As a consequence, voluntary or consensus

standards are likely to become more prevalent, especially in France and FRG. While the recombinant-DNA research guidelines are being liberalised in almost all the major countries, Japan, France and the US have particularly revised their guidelines to promote rapid commercialisation of BT. While most countries depend upon their existing environmental and product approval legislations for introduction of new BT products into the market, deliberate release of applications of genetically engineered plants and organisms is being restricted where potential risks associated with release into the environment are yet to be assessed. Most countries have concentrated on developing regulations and guidelines covering commercial development of health care products, viz, drugs, biologicals and diagnostics being produced through BT.

OPTIONS FOR INDIA—SOME SUGGESTIONS

Since India is at the threshold of BT research and at least some industrial houses are taking keen interest both in the areas of agriculture as well as health care products, it cannot afford to be complacent (which it apparently is not, judging by some of the efforts of the department of Biotechnology) regarding the issues of regulation of BT. It is particularly important in the light of the fact that little expertise is being developed within the country on long-term impact assessment or potential risks to health and safety of such BT products. Attention is therefore, required to be focused on careful examination of the data submitted in this regard by the industrial houses/other agencies from the countries exporting these technologies (or even collaborative research programmes) to India. The case of an inadequate machinery of the Drug Controller of India should be ample indicator for this concern. The following suggestions have therefore been made considering the present Indian reality.

(1) There has to be sufficient legislative provisions for control of both the industrial units and R and D centres. Though the control in the case of R and D centres could be more appropriately vested in the department of biotechnology (since they are also involved in co-ordinating and financially supporting most of R and D in this area), the regulation of the industrial (and field trials) units should be the task of the department of environment (DO Env), with adequate support of specialist scientists and testing impact assessment facilities (possibly from a cell in DBT under a recombinant DNA Advisory Committee—RDAC).

(2) Insofar as biosafety considerations in R and D are concerned, detailed guidelines of NIH, UNIDO/WHO/UNEP, EEC, Japan, OECD and other countries do exist about the classification of various micro-organisms and biotechnologies and their regulation. Based on our own experience, as well as those from these countries, as described here, detailed guidelines can be prepared where the laboratories need to be monitored not only through voluntary information from the laboratories on specified questionnaires but also occasional random checks on the lines of NIH/FDA of the US. Thus, voluntary information should be sent by these units to the department of biotechnology on the nature of research, the potential risk and the steps taken by them to ensure safety of the workers as well as the environment. Popularisation of guidelines in this regard should be done by the Institutional Biosafety Committees and the random checks by teams of experts from the department of biotechnology (under RDAC) should intially be to motivate rigorous follow-up of these guidelines.

(3) Insofar as the industrial and field use of such micro-organisms and BT products are concerned, the regulation has to be through regular monitoring of health and environmental safety at various levels starting from notification and licensing. Moreover, the principle of strict liability has to be followed with appropriate modification of what is proposed in the Environment (Protection) Act, 1986 in clauses 8 (which also includes hazardous micro-organisms in its purview) and 9 (regarding provision of all the relevant information, as has been committed in the environment and health impact assessment of the concerned BT done by the organisation, to the DO Env, the failure of which will not permit continuation of such activity).

(4) Adequate infrastructural support has to be created by the department of environment (or any authority proposed in the act of 1986) to ensure not only effective inspection and monitoring but also to prepare environment impact and risk assessment reports with respect to micro-organisms and BT products.

(5) There has to be mandatory registration and notification for new r-DNA modified organisms of category II and III before any permission can be granted for their industrial or field applications. The same has to be followed for their imports also.

(6) With regard to the waste disposal of biotechnological processes, similar methods have to be followed as in the case of conventional biologicals as envisaged in the EPA. However, detailed guidelines need to be developed for these and hospitals and nursing homes, etc, have to be brought in under the purview of such legislation.

(7) As regards handling, storage and transportation of hazardous biologicals and BT products, detailed guidelines for labelling of the package, etc, have to be developed and strictly followed with appropriate changes in Railways and Posts and Telegraph Acts.

(8) Regarding the disposal of waste generated by medical and health institutions, updating the existing Public Health Act and ensuring the introduction of adequate measures to be undertaken by all states and union territories for the safe disposal of waste generated by medical and health institutions is urgently required. Since the impact of public health measures taken in a given state is not restricted to the state alone, the centre will have to take the initiative in this regard. In particular, there is a need not only to develop guidelines for control of infection generated inside medical and health institutions but also to ensure safe disposal of wastes generated by them. There is in addition the need to plan and monitor control measures for all such infections.

Final Act of June Fourth China

Govind Kelkar

The profile of June Fourth China started to emerge in December 1978 at the Third Plenum of the 11th Party Congress. It was then that Deng having seized power launched new policies of economic reform and political orientation—abandoning the line of class struggle.

DURING the student movement, China appeared, both to sympathetic observers of what was going on there for nearly two months and to severe critics of Deng's economic reform policies, a country where students with the support of scientists, intellectuals, journalists, workers and small vendor-cum-entrepreneurs, had almost managed to grasp political power and were now trying to challenge the reformist regime by giving birth to a new socialist system—one that would be opposed to the mode of running a degenerate state in socialist garments and would allow greater individual freedom and democratic rights. This was followed by a frenzy of state repression of the movement, PLA bullets, a massive massacre of the people, crushing of the 'Goddess of Democracy' in Tiananmen Square and the fall of the Communist Party of China's (CPC) general secretary, Zhao Ziyang, reportedly for his lenient attitude to the student movement. How do we understand this crisis of a socialist state?

The official position of the CPC, after the crackdown on June 4, alleged that the students aimed "to overthrow the Communist Party and Socialist system and to turn China into a bourgeois republic". It may well be partly true. Students and their supporters have abandoned all hope in the CPC and its socialist system, at least in anything like its present form. The striking students along with scientists, journalists and petty entrepreneurs as well as workers were disappointed with the growing corruption, speculation in colour TV sets and desire for foreign cars in the higher echelons of the party and the bureaucracy. They, nevertheless did not plan or ask for the overthrow of the present regime in China.

The students defined their role as 'communist fighters' and their banners read "People have the right to know all the facts, the right to discuss, participate and supervise state affairs"; "To lose the people is to lose all"; "Give proper evaluation to the student's movement"; and "We demand nothing but our nation's prosperity and strength". Evidently, what the students demanded was not the end of socialism. According to Xinhua reports, in early May, their slogans included: "Support the Communist Party"; "Support Socialism"; "Support the Constitution and Reform"; "Advance Democracy"; and "Oppose Corruption". Evidently, what the students demanded was not the end of socialism but some rectification of the existing system in China, including the head quarters of the party and bureaucracy, and also democratisation of the system. These measures, by any yardstick, are not an antithesis of socialism or inimical to the ideology of Marxism-Leninism and Mao Zedong thought. Clearly, therefore, the Deng Xiaoping-Li Peng regime has no ideological justification for killing dissidents and launching a witch-hunt against leaders of independent trade unions or autonomous unions. This only suggests the desperation of a totally alienated state attempting to secure its existence and "socialist legitimacy" by shooting students and their supporters.

Importantly, the People's Liberation Army (PLA) was ordered to defy its ideological formulations, prescribed by none other than Deng himself: "Do not hit or swear at the people". Paradoxically, now cadres have been asked to promote love for the army and unify peoples' thinking on the basis of Deng's speech on June 9, 1989 where he "made a profound analysis of the cause and nature of the counter-revolutionary rebellion and the correctness of the measures" adopted.

One should note at this point that there has been a radical change in the official interpretation of the student movement. Around May 13, when students began a hunger strike to protest against the Chinese authorities' slow approach to a dialogue with them, the student movement was officially described as "patriotic in nature" and it was clarified that the regime "will not penalise students for their radical words and actions". The official media, particularly those geared to the outside world like *China Daily* and *Beijing Review* carried positive reports on the student movement. For instance, *China Daily* of May 18, carried a bold photograph of the demonstrators, with a headline "A million march in support of students". Below the photograph was written the following:

> More than a million people in Beijing march to Tiananmen Square to show their sympathy and support for the student hunger strikers who entered the fifth day of their fast yesterday. The marchers, including teachers, scholars, journalists, officials, workers and self-employed, urged the leadership to respond immediately to students' demands so as to end the fast as soon as possible.

It was around this time that students were reported to be converging on Beijing by train, at an estimated rate of 50,000 a day, to back their fellow students, at Tiananmen. Trains tended to arrive more punctually and students, carrying banners and placards, were travelling free with the support of railway workers. They were reportedly coming from the neighbouring city of Tianjin as well as the more distant provinces of Heilongjiang, Jilin, Liaoning, Hebei, Shanxi, Anhui, Hubei, Shanaxi, Jiangsu, Guangdong, Inner Mongolian Autonomous Region and Shanghai. During these very days (May 17-18), the party media reported that general secretary Zhao Ziyang, on behalf of the central committee and the state council affirmed the students' patriotic spirit in calling for democracy and law, opposing corruption and striving for further reform. On May 22, during his visit to Canada, Wan Li, chairman of the standing committee of the National People's Congress, told the press, "We will firmly protect the patriotic enthusiasm of the young people in China". However, within China, the movement was officially called 'turmoil' around May 19-20, and Premier Li Peng advocated the use of strong measures to restore order. Soon after, it was reported that the PLA in their uniforms and with tanks had started entering Beijing. Then followed the June 4 massacre (killing somewhere between 300 and 3000 people), and the arrest of leading activists and the execution of many of them. It is not intended here to give a chronological account of the June 4 army action or discuss the details of party factions in the CPC. It is very evident, however, that the CPC leadership and government were certainly divided over the treatment of the student movement. After the crackdown, the Deng Xiaoping-Li Peng group which managed to remain in power, denounced the student movement as a 'counter-revolutionary rebellion' and praised the PLA for its loyalty to the socialist state and for its swift action against the dissidents.

CONTOURS OF A CRISIS

The profile of June 4 China started to emerge in December 1978 at the Third Plenum of the 11th Party Congress of the CPC. It was then that Deng Xiaoping

seized power and launched new policies of economic reform and political orientation—abandoning the line of class struggle. The party's effort to promote equality and socialism by using the superstructure were criticised as the policy that created 'chaos' and leftism like that of the Cultural Revolution. Instead a traditional approach of promoting socialism by developing the productive forces was adopted. The programme of four modernisations overlooked the possibilities of its demands on the political system and on regenerating inequalities in society. Besides, Deng's primary concern with economic reform did not necessitate a reassessment of the status of a centralised CPC and a professionalised army. Instead there was only the frequent reiteration of empty dogmas that party members and cadres were expected to support. Some China scholars wondered, if Deng Xiaoping was leading China away from socialism.

Since 1978 China has undergone a profound change in its political economy and organisation. China experienced not only a radical decollectivisation but also the beginning of a new development cycle. The three-level ownership—the people's commune, the production brigade and the production team, with the last as the basic accounting unit—had been found unfit for the growth of Chinese economy and was discarded. Political power of the township government and the management role of the village committees were reinstated. Besides, the contract system or the responsibility system, which was implemented for economic reasons, led to enormous increase in incomes of Chinese peasants but their surplus income has been used mainly for consumption, including the construction of 'double-storey' housing rather than productive investment. The accumulation of private wealth as a result of these policies permitted the rise of a group of successful managers, but channels for upward mobility were not being expanded.

The establishment of the Special Economic Zones has been another distinctive feature of the new reform policies, which represent at the outset the construction of an economic system based on capitalism. Of course this was accompanied by a proclaimed socialist ideology. The official explanation for introducing the Special Economic Zones was the need to push the growth of the capital-intensive, high technology sectors. These zones, officially representing the market mechanism, were to run along with other programmes for science, education, culture and tourism, which were being developed along socialist and patriotic lines.

The Communist Party and government of China concluded that the country was still in the primary stage of socialism on the basis of its own specific historical conditions. The new economic reform was a process of moving China from its natural and semi-natural economy to the commodity economy. They, therefore, accepted all the essential elements of improving 'the productive forces in quality and quantity'. The key to developing socialist commodity economy was to raise the productivity and commoditisation of agriculture and improve the living standards of the people. In the primary stage of socialism, the relations of production, which tend to carry traces of the old society, are not 'pure' and are of a transitory nature. The Chinese Communist Party and the government therefore saw no deviation from socialism when they encouraged different types of ownership to co-exist, with public ownership remaining predominant, and in allowing income from private capital and production materials on the principle of 'each according to his work' as the dominant form of distribution. What the leadership failed to see, however, was that the reform policies have increased the distance between the political apparatus of the ruling class and the common people.

The present Chinese leadership appears to be interested in establishing a superstructure that seeks the development of productive forces and the commodity economy. China's economists and theorists have made efforts to reassess contemporary capitalist societies and have acknowledged the latter's contributions to solving two major problems of classical capitalism: the poverty of labourers and the stagnation of the development of productive forces. Given this nature of 'socialist' culture and political economy of China of the 80s, what socialist credentials do the official elites have to turn around and accuse the students of deviating from socialism and seeking bourgeois democratic rights?

Significantly, 'moral crises' affecting the youth have been frequently reported in the Chinese press since 1979, which was not the case in the pre-economic reform period. There has been a general awareness and official recognition of two related problems: large urban unemployment and widespread loss of faith in socialist ideology among the youth and students. However, no attempt has been made since the late seventies to encourage political education among the youth or to generate faith in socialism. The institution of political, ideological meetings was discarded as 'ultra left' and wasteful for China's modernisation programmes.

In order to deal with the rise in unemployment in cities and the growing 'youth delinquency' in the countr Chinese social scientists and the offici elites have repeatedly suggested th women should be given only part-tin jobs and that they should devote mo time to household chores and the 'raisir of good children'. The Women's Feder tion successfully resisted these efforts ar criticised such policies that envisage women's return to household drudger and child-tending as being 'incompatib with socialist modernisation'.

Significantly, women's resistance an protest preceded the student movemen Women workers and students were th first to question the adverse impact of ne economic reform policies that threatene their marginalisation in politics an decision-making and promoted discrim nation against them in employment Women's organisations, in their efforts t further mobilise women for their ow cause, were supported by feminist student and intellectuals. Likewise, in early 1985 a number of young women through thei protest writings in the magazine *Fujia Youth* angrily ridiculed male assumption of the 'meek, weak and sweet wife'.

In response to the suggestion that 'woman should be a virtuous wife an good mother', several women asked me to aspire 'to uphold traditional morality and strive to become 'virtuous husband and good fathers'. Some critics of women' dependence on men and their inferio social existence declared 'women is not th moon. She need not depend on the ligh of others to shine'. They further suggeste that if men were to assume more respon sibility for housework, then women woul become more equal within their familie as well as in society.

Student Demands

The student protest began on April 1 after the death of Hu Yaobang. The coordination among some 30 campuses permitted cohesive action for two major demands: (1) democratisation; and (2) the end of corruption. As the movement gained strength and support from other sections of society and as the government showed an increasing inflexibility in conceding their demands, there appeared growing evidence of the students' protest against the leadership and its mode of governance. Demands were raised for the resignation of Li Peng and Deng Xiaoping. These demands did not however determine the character of the student movement. What the students really questioned was the alienation of the Chinese state from the people—its centralised, authoritarian, undemocratic character, the potential use of force as an answer to the demand for a dialogue with the people,

and rampant speculation in consumer goods by the official elite.

The student demands should not be mistaken, however, either for an attempt to overthrow the present regime of China and its brand of socialism or for the return to a Cultural Revolution type of socialism. Their demands seemed closed to bourgeois democratic reforms in China and very much in tune with the new economic reform policies. There seemed, indeed, strong support for the full play of the market forces and for the new economic reforms to run their course. Thus it was commented in *China Daily* of May 8, 1989:

> Looking back one realises that there are things far more critical to China's reforms and development than student slogans and grumblings. Sooner or later, all China will have to ask: Can the ever-increasing price subsidies eventually harness inflation? Can guaranteed welfare promote labour productivity? Can farmers keep producing when their business is unprofitable and meagrely funded? Can teachers and researchers continue their careers with all their hardships? Can bureaucracy, corruption and irrational decision-making be controlled without a public supervision mechanism?

Wang Dan, the Beijing University student leader, in response to a question about whether he supported the leading role of the CPC, said, "You can say I support correct leadership of the Communist Party" and emphasised the word 'correct'. Further, a group from Quinghia University showed much indignation when they were asked if they opposed the Communist Party. One of them said, "We are not against the government, just against the way it is run. It is a question of the party atmosphere of corruption and bureaucracy".

The June 2 Hunger Strike Declaration (issued by four student leaders just before the shooting began) proclaimed the students' right to fight for freedom, democracy and human rights, saying, "we are not in search of death, we are looking for real life". The declaration, however, denounced the mode of class struggle, "we must completely get rid of the political culture of class struggle", and "get rid of the tradition of pure ideology making, of sloganising, of objectifying, since these are empty demagogy". The declaration further stressed the need

> to get rid of old political culture and adopt a new political culture which should have (1) democratic procedures and participatory institutions—rather ten devils to check each other than one mandarin with absolute powers; (2) the accountability of the state to the people; (3) the right to recall those leaders who have made serious mistakes; and (4) legitimate autonomous and unofficial organisations which should generally form a non-official political force as a check to government decision-making that is the essence of democracy.

Obviously the students did not want a return to a purer form of socialism, e g, the ideology of taking class struggle as the key link, and were opposed to the 1966-76 Cultural Revolution that "inflicted so much suffering on China". Neither did they want a reversal of the new economic reforms or a return to the collectivisation process. What they did really seek was the reform of the existing Chinese state so that it would halt its growing alienation and introduce a system of accountability to the people through strengthening public supervision.

In discussions and writings during the six-seven week period, there were numerous references made to the May Fourth movement of 1919, which although a bourgeois democratic movement, nevertheless provided a crucial ideological background for the formation of the CPC in 1921. The May Fourth Movement was discussed as a critical step in saving China from foreign aggression and from the clutches of a demoralised state. Interestingly, the Chinese media referred to the principal leaders of the movement, Chen Duxiu and Li Dazhao, who were also the founding members of the Communist Party. These quotations indicated that (1) the state is not above everything else, nor does it enjoy supreme power over the people; and (2) since the west was 'dynamic' and 'progressive', China could use western institutions as reference points in improving its polity and economy.

Interestingly, during their dialogues with government officials, the striking students had raised questions about why state investment in agriculture had dropped over the past few years; about insufficient educational expenditure; about speculation in colour TVs and their marketing; and how to control the import of cars and promote the country's own auto industry.

The character of the student demands and the subjects of their dialogues with government officials, however bourgeois democratic they might be, have by no means proved a threat to China's existing socialism. Besides, is Chinese socialism not prepared to grant even bourgeois democratic rights and/or the right to have non-party people's organisations?

Changing Terms of Discourse

A Poser

Manoranjan Mohanty

An examination of terms of discourse assumes importance in establishing whether post-colonial societies have been able to alter the terms which were fashioned under colonial control. The intellectual processes propelled by colonial regimes derided indigenous systems of knowledge and nurtured natives incapable of comprehending their own history and culture. Post-colonial states normally had little choice other than consolidating inherited systems.

TERMS of discourse like terms of trade are usually favourable to some and unfavourable to others. Once the latter realises the situation they would seek to alter the terms and make them less unfavourable to them. They would strive for making the terms of discourse more balanced, equitable and perhaps democratic. There are now discernible voices in the third world that question the prevailing terms of discourse and it is time we acknowledge the significance of their challenge.

Terms of discourse are the conditions governing the intellectual arena, the basic parameters defining the theories, the concepts and the methods of analysis. There is a political character embedded in the terms of discourse because the framework of knowledge itself places some systems, institutions and groups in more advantageous positions than others. The element of power thus enters the discourse. Here it is useful to use the presently popular word 'discourse' because it explicitly refers to two or more participants in the business of knowledge. Besides, discourse has a particular concern, a particular theme at each level which can be put together to provide an aggregate picture. It is convenient to see the political placement of parties to a discourse. Discourse can be carried on in oral or written medium, literary, or other modes of communication, it may just express itself in the life pattern of groups of people. But in each case once the effort is made to map the discourse, or to characterise it, one of the things that is necessary to identify is the terms of discourse.

The reason why it is important to study the terms of discourse is the question whether the post-colonial societies have been able to alter the terms of discourse which emerged under colonial aegis during the past two centuries. The intellectual processes which were propelled by colonial regimes derided indigenous systems of knowledge. The educational system nurtured generations of natives who were incapable of knowing their own history and culture adequately. The post-colonial states normally had little choice other than consolidating the inherited systems. The nationalist leadership defined their development goals within the same terms of discourse. Only when there were serious problems on the ground and new social movements grew up raising new kinds of questions in the late 1960s and 1970s challenges to the prevailing terms of discourse were visible. While the 1980s saw more of these movements, there also appeared a trend of aggressive reassertion of the western liberal terms of discourse by some third world leaders, conspicuous among them the leaders of India and China.

It is interesting to trace the process of intellectual encounter between colonialism and the indigenous elite. The Indian experience more or less represents the general pattern in other colonial situations. It begins with practically a discourse among equals and gradually the terms change in favour of colonialism. Eventually a new framework of knowledge gets predominant position in the colony and survives the transfer of power. This framework would acquire a new character depending on the nature of the anti-colonial struggle.

In the early phase of colonialism a political defeat of the native rulers at the hands of the colonisers does not immediately put the local intellectuals in an inferior position. In the first half of nineteenth century there were many Hindu and Islamic intellectuals who with their mastery over the classics of India and their knowledge of Indian history confidently engaged in debates with the westerners. The Indians who obtained English education in India or in England had among them some who knew both the knowledge systems fairly well. Many of the reform debates during that period reflected relatively equitable terms of discourse.

As the decades passed and political power got consolidated and English education spread a new elite began to emerge. For this elite English education was not a tool to strengthen its understanding of its environment and the roots of the human condition. It was the inculcation of a new value orientation that assumed the superiority of the western civilisation. In fact the tragedy of the new education system was such that it did not impart a proficiency in the methods and techniques of knowledge, but stressed the sympathetic understanding of western philosophy, science, economics and politics among others.

This development was challenged by three strands of intellectual activity. One was the movement for religious revivalism which counterposed its construction of an idyllic Hindu past to the claims of the west. It had a mobilisational function, but lacked a matching rational approach. It could therefore be easily sidelined by the western challenge. But revivalism remained an important trend in Indian society significantly contributing to the growth of communalism in later years. Some like Vivekanand, Dayanand and Bhima Bhoi represented the second strand in the late nineteenth century. They re-constructed the Hindu worldview critically assessing the rationality of various concepts and practices. There was a dialogue with the west by whose culture they were not overawed. Vivekanand propagated what he thought was India's message to the decadent west. Through these efforts Indian nationalism acquired a cultural and historical base. At the same time it became clear that the views of India's past could be variously constructed. It could reflect the Brahmanic terms of discourse that not only missed the multi-religious, multi-cultural character of ancient India by exclusively emphasising a certain Hindu image, but falsely asserted the Brahmanic view as the view of the whole society. The reformist outlook of Ramakrishna Mission and Arya Samaj partly acknowledged this. The Mahima Dharma of Bhima Bhoi started as the religion of the Adivasis and Achhuts (untouchables) for autonomous self-realisation. The third form of challenge came from literary works in the second half of the nineteenth century in practically every language in India satirising western mores, mocking at the westernised elites' poor imitation of their colonial masters. Bankim Chandra of Bengal and Fakir Mohan of Orissa had their counterparts elsewhere. These writers often themselves were officials of the colonial state. But that did not prevent their self-satirisation. The literature of these

writers presents a complex picture reflecting the evolving trends in the cultural encounter. But with hindsight we can today see how powerful was their challenge to the western terms of discourse.

By the turn of the century all three trends are overcome by the force of colonial cultural offensive. This offensive was part of an increasingly sophisticated operation of the colonial state. But on the whole it was almost successful in convincing a major portion of the elite of the supposedly civilising mission of the British colonial rule in India. But the battle went on nevertheless. Gandhi's *Hind Swaraj* was perhaps one of the last authentic texts by an undefeated mind who was thoroughly acquainted both with the Indian and the western traditions. By the 1920s there is the emergence of the English educated in bureaucracy as well as in the professions now in a sizeable number. This section now begins to define Indian nationalism in the western terms of discourse. There are the attractive concepts of freedom, equality and democracy which had been popularised through the movements in Europe during the past two centuries. They became the carriers of the package of liberalism and capitalism which the colonial regime forcefully propagated in India. Nehru fast emerged as the spokesperson of this outlook. Having been exposed to Fabian ideas in England he brought into the discourse some progressive elements. He was convinced that for India to grow into an independent, self- reliant powerful country the path of the industrial revolution was a must. Eventhough it was a patriotic, anti-colonial outlook, its notion of nationalism was in a sense derivative of the western liberal approach. In the final years of the freedom struggle this line gained prominence as a result of a number of developments which we need not consider here.

After independence this line of thought—nationalism defined in western terms of discourse—was institutionalised. With the further ascendance of English education and operation of parliamentary democracy, constantly having the western experience as the reference point, the dominant framework of knowledge of the colonial era got firmly grounded in the state process.

Marxism and Discourse

Marxist ideas had an important function in the colonial situations. They provided a critique of colonialism by placing it in the history of capitalism. The exploitative character of the capitalist political economy was exposed. In fact, the internal contradictions of the capitalist system were comprehended in detail. The great liberal values now looked different. Marxism now explained how a socialist revolution was necessary in order to realise freedom and equality for the masses.

Besides being a critique of capitalism Marxism was a new method of looking at life and history. That reality has to be understood as the dynamics of a historical process in which humans were involved in exploring nature was the starting point in this method. In the process of this exploration social formations grow among which class is the most crucial category. There is an interacting relationship between forces of production and the relations of production. When an old system of social relations does not fit the demands of a new production situation it is sought to be transformed. These notions form the method of dialectical and historical materialism. Its significance lay in the discovering connections among disparate phenomena and comprehending the totality of a system or a historical process as well as the specificity of a particular situation. It helped in unravelling the ideological roots of social theory. In doing so it exposed the body of liberal theory in pointing at their capitalist assumptions.

The framework of knowledge which the colonial state had promoted in India could now be subjected to a class critique. Colonial terms of discourse were seen as essentially being capitalist terms of discourse. Was it that neat a package, many people asked? Because the colonial state had protected major strands of Indian conservatism and even encouraged communal ideology. Hence many saw a combination of pre-capitalist and capitalist terms in the knowledge system advanced by the state. Constructs of indigenous culture were subjected to class analysis. It had been assumed by many that what was claimed as Indian culture was the heritage of both the upper castes and the lower castes, the wealthy and the dispossessed, the powerful and the subjects. With the help of Marxist method it was possible now to question such discourses on culture, eventhough the colonial as well as the post-colonial state never welcomed this questioning. In this challenge to the rulers' terms of discourse there was obviously a challenge to the authority of the rulers.

Marxists in India, however did not follow the logic of this method further to unravel the character of their history and culture. The specificity of Indian social institutions, like tribal social formations, castes, religious practices, gender relations, remains unexplored. Most of these were explained away either as vaguely pre-capitalist practices or in terms of 'Asiatic' or 'Oriental' formations. One must emphasise the fact that in exposing the class character of the state and its policies Indian Marxists have made a significant contribution. But they have not been able to alter the prevailing terms of discourse. It may be said that since they have not achieved state power they could not succeed in changing the terms of discourse. But the paradox is that their inability to present an alternative framework of knowledge may be one of the reasons for their failure. A dialectical and historical framework of knowledge imbibing the culture and history of the working people of India, grasping their symbols and images and subjecting them to critical examination may perhaps challenge the prevailing terms of discourse.

This is not a plea for indigenous colouring of western liberal or Marxist theories. Even the standard Marxist formulation of 'creative application of universal truths of Marxism to the concrete conditions' to some extent begs the question. We are yet to discover universal truths. The dialectical and historical materialism only opens an enquiry seeking truth. Much of the prevailing knowledge has a parochial geographical base in the western world. To make knowledge universal requires comprehension of historical experiences of non-western societies. Not just for testing theories generated in the west, but generating theories and contributing to the world fund of knowledge. Marxist method provides greater opportunities for discerning historical specificities. But it has not been adequately used. As a result, to many in the third world Marxism appears to be part of the western framework of knowledge operating the post-Enlightenment terms of discourse.

Subaltern Discourse

In recent years the subaltern studies have emerged as a significant challenge to the prevailing terms of discourse. The set of historical studies on colonial India focus on the struggle of the oppressed as they themselves would perceive it. It is a critique of the elitist view of history. Marxist historiography had missed the subaltern viewpoint eventhough it had attempted a class analysis of historical processes. The subaltern scholars accuse the earlier historians of ignoring the autonomous voice of the masses, their often spontaneous resistance to oppression, their idiom of protest and the political significance of this range of activities. Organised movements, leadership and their ideologies have preoccupied the historians for long. The subaltern scholars point out that the realm of the people at the grassroots level provides greater clues to the understanding of the social process than the organisational claims.

Like the 'pedagogy of the oppressed', the subaltern perspective exposes the prevailing terms of discourse as elitist. The framework of knowledge underlying both nationalist and Marxist histories of colonialism and nationalism in India was elitist, eventhough the Marxists analysed the class character of various develop-

ments. The struggle of the peasants and workers no doubt finds a place in the account, but only in terms of the leadership's view of them. The subaltern studies also look for the modes of cultural behaviour of the masses in the context of their resistance to oppression. That draws our attention to an unexplored arena of mass activity. Therefore, this trend of scholarship has made an important contribution to the changing terms of discourse.

Yet a question is raised whether the subaltern scholars are not operating within western framework of knowledge. If the liberals operated on the premises of bourgeois nationalism and the Marxists derived their inspiration from party-led workers' struggle in the wake of the industrial revolution, the subaltern discourse springs from the ideology of folk resistance also framed in the western historical context. The terms of resistance discourse are very much derived from western history and ideas and even when Indian people's specific cultural modes are discussed they are seen through the prism of these terms.

Discourse of 'Alternatives'

While the subaltern scholars exposed the elitist character of existing knowledge the critics of the dominant development models came out with a number of objections to the claims of the western modernisation theory. The two most serious charges are that the western development model, adopted by the third world elites, have resulted in authoritarian state structures, and secondly, it has caused a steamrolling process suppressing the diverse cultural urges of indigenous people. The other well known criticisms include the creation of disparities even when productivity rises and the ecological disasters that these development policies have led to. In the name of secularisation authoritarian policies have been implemented which have led to alienation of cultural identity groups. The slogan of science and technology as the essence of progress has given rise to a 'silicon state' under which banner the ruling classes have ruthlessly carried out their strategy of development to consolidate their power. This development strategy is part of the world process which creates structures of dominance and dependence and generates forces of militarisation. Hence the urgent need for 'alternatives' to this dominant development strategy.

Since the mid-1970s we have a trend of thought in India propelled by the reactions to the Emergency and further encouraged during the Janata period when a debate on India's development strategy raised many new and interesting questions. Since then the trend has grown in response to the series of catalytic events in India in the recent years. The civil liberties and democratic rights movement, the campaign for minority rights, women liberation movement, the ecological movements and the campaign against state repression have strengthened the critique of the prevailing development theory.

The alternative perspectives first of all expose the western cultural roots of much of these ideas and then invoke indigenous traditions to provide authentic modes of construction of society. Gandhi's critique of the western civilisation is an important tool of this analysis and in fact his thought has become a baseline for a range of alternative notions of change. Rationality which is supposed to inform the western development theory is questioned as a particular culture's notion counterposed to notions of rationality in other cultures. Thus there are alternative sciences and alternative rationalities. Going down to the grassroots level we can see how people are resisting the state-backed development strategy. Their movements which are questioning the prevailing development paradigm are also challenging the parties, organisations and intellectuals who share that outlook. The alternative perspective involves an attempt to comprehend their language, their modes of struggle and their symbols and images of living.

This trend is yet another powerful element in the changing terms of discourse. It too exposes the western roots of many of these theories which claim universality. Its critique of technological rationality has significant implications for evolving new terms of discourse that can avoid positivist deviation. That new forms of hegemony at different levels have resulted from this development model has been spelt out elaborately by these scholars.

Where this perspective slips into subjectivism is in dealing with rationality. In its enthusiasm for attacking positivist rationality and science it throws away the possibility of rationality that may cut across cultures and science that may be true in many lands. It does not distinguish social organisation of technology from technology, rationality of a decision from rationality. This is related to a lurking hesitation to identify the class basis of this development strategy. Eventhough these scholars have criticised capitalism and imperialism as dominant world processes, in the same breath they criticise socialism saying that the state systems of both have unleashed the same processes of development, secularisation and militarisation on a worldscale. Granting that socialist states evolved bureaucracies and caused alienation it may not be sound logic to ignore their class character as distinct from that of the capitalist states. Besides the search for alternatives in the indigenous tradition has led them to see tradition in an undifferentiated way. They see the pluralities of traditional symbols, but not contending streams among them, reflecting social struggle. This has often led to glorification of indigenous tradition, often homogenised into more or less the Hindu view of life. Thus it has gained acceptability among the conservatives despite protestations by the alternative proponents that their theory is not conservative rationalisation of tradition. On the one hand the alternative perspective heavily relies on indigenous tradition and on the other it does not present a class critique of the system (the criticism of state has often centred on leadership's decisions, style and choice rather than its social character). Hence this eloquent intellectual trend seeking alternative remains a permissible dissidence within the ambit of capitalism both at the national and at the international level. At the same time this trend belongs to the forces of democratisation of terms of discourse.

What we see around us is an intellectual turbulence arising out of people's democratic upsurge. Throughout India there are movements of various kinds which do not fit our intellectual categories. In the western systems capitalism has reasserted some of its classical properties after half a century of structural adjustment. Socialist systems have experienced catalytic changes since the twentieth congress of the CPSU and the Chinese Cultural Revolution and are undergoing significant restructuring at present. The post-colonial world created its own rigidities based on the inheritances of the colonial past. When the old categories are getting exposed new rigidities are likely to emerge. A subaltern perspective, an alternative science or an argument stressing the autonomy of the ethnic dimension may be a creative theorisation at one level, but pushed to an extreme it can grow into a new rigidity. The radical critique of development and militarisation in the west in the late sixties developed its own rigidities facilitating a conservative social science backlash. The theory of socialist modernisation in China under Deng Xiaoping has similarly questioned each and every formulation of the Cultural Revolution. That experience has to be kept in mind.

What we are looking for is a bunch of keys to unlock the structures of power underlying the prevailing framework of knowledge. Scattered keys are being thrown around exposing the terms of discourse, now colonial terms, now bourgeois terms, now Brahminic, and so on. How to link up these hegemonies, string together a bunch of keys to democratise the terms of discourse, is the question. That is inevitably part of a larger democratic struggle. In that struggle creative theory plays a role by revealing the terms of discourse and replacing them by terms that may be both democratic and true.

Political Economy of European Socialist Systems

Arun Bose

Marxism and Political Economy of Socialism by K K Das Gupta; Sterling Publishers, New Delhi, 1989; Rs 225.

THIS 400-page book is tightly packed with detailed information about the how's and why's of 'real life' European socialism, i e, of the communist-party-managed socialist systems of the USSR and the 'people's democracies' as continuously *evolving* systems (only Albania is entirely excluded from its scope). The book belongs, essentially, to the genre of compendia, and *not* of analysis (whether like V S Dadayan's *Macroeconomic Models* (1981) or his latest work of pure analysis interwoven with gripping statistics and social comments *Orbits of the Global Economy* (1988)). Nonetheless, the book is flavoured, almost at every point, with a Marxian view of the world of socialism: the author's own as well as of those many writers living in communist-managed socialist countries who have tried hard to adhere to such a view.

The author emphatically rejects the opinion, which he attributes to Paul Sweezy, that Marxism is relevant for understanding and ending capitalism, but not very relevant for building (or defending) socialism. Many of his fourteen chapters also focus on the extent to which, explicitly or implicitly, whether in a laboured and tortuous manner or not, the discussions of socialism in power in these countries have repeatedly fallen back on Marxian concepts and tools of analysis. So the book is rightly given the title *Marxism and the Political Economy of Socialism*, although private judgments of readers may differ on the quality of both the Marxism and the political economy of socialism which is revealed. Indeed, if there is a deficiency in scope, it is that it hardly pays any attention (critical or otherwise) to landmark contributions of Barone, Taylor, Lange, Chayanov, Kantorovich, Nove and Ellman which represent perceptive non-Marxian approaches to a serious study of the economics of socialism. Of course, this class of omissions can be justified. These writers have received much attention and Das Gupta is anxious to focus on other writers, living in socialist countries, about whose work hardly anything is known in India (partly because in India there is an ingrained habit of looking at communist-managed socialism through English or French spectacles). On the other hand, omission of all references to the works of the ill-fated Preobrazhensky, Bukharin, Fel'dman, as well as Dadayan's 1981 work is puzzling. Dadayan's may be 'too abstract', but the same cannot be said of the works of the others.

Though published in 1989, the book is strictly pre-perestroika and pre-glasnost. There is not even a single reference to these two words in the book, nor about the impact of these two key words on all discussion of socialism and capitalism, ever since they were adopted officially by the ruling CPSU as the basis of all thinking and practice in the mid-eighties. But the relation of the somewhat 'dated' subject-matter of this book and the impact of perestroika and glasnost is all-important. At the very least, it compiles the many, sometimes bizarre, details of the numerous *different* starting-points of these rather sensational developments. Contrary to widespread impressions, perestroika and glasnost did *not* drop from the skies, nor was it engineered only by a CIA-KGB unholy interchange, nor is it the fall out of de-Stalinisation or (as is less widely believed) Mikhail Gorbachev's determined bid to counter-intimidate an anti-Gorbachev majority in the CPSU Central Committee (probably after his speech at Vladivostok in 1986). Perestroika and glasnost have a long pre-history, both in the USSR and the people's democracies. Das Gupta's book gives us useful glimpses of this pre-history.

Backdrop Models

It is fairly well known that from 1917 the Russian Bolsheviks were driven by a millenarian vision of a socialist alternative to capitalism. What the available literature, including some which receive no attention in Das Gupta's book reveals is that in some cases consciously and explicitly, and in other cases half-consciously and without acknowledgement, the Bolshevik activists (including very active intellectuals) took the help of macro models of the Marxian political economy of capitalism to work out by daring intellectual improvisations, macro models of the political economy of an evolving and developing socialism. This process started in 1917, and has continued almost without a break ever since (in spite of many sharp discontinuities introduced by Stalinisation and de-Stalinisation and partial re-Stalinisation) and has also developed not only imitatively but in highly original ways, in almost all the people's democracies.

In most cases, there are acknowledgements to Marx (and Lenin, who never failed to acknowledge Marx as the source). It is easy to list at least eight such models:

(1) 'Material balances models' which made a total break with English (though not French) political economy and bourgeois neo-classical economics of all kinds, by putting in the centre of the picture of 'the circular flow of economic life'—the two-way interdependence of sectors (in place of the *'one-way avenue* from factors to products'). This was the basis of the Soviet GOELRO electrification plan drawn up by a commission headed by Gleb Krizhizhanovsky in 1920.

(2) Marx's schemes of extended re-production under *capitalist* property relations adapted to discuss the necessary proportions between output of department I (producer goods) and of department II (consumer goods) for the accelerated development of a socialist economy with minimisation of 'disproportionality crises' which are unavoidable under capitalism. This became the standard doctrine over a long period, and is derived from Marx's *Capital* volume 2, and buttressed by Lenin's *On the So Called Market Question*.

(3) An improvised model of 'primitive socialist accumulation', adapted by Preobrazhensky (and endorsed for a time by Bukharin), which was improvised by analogy with Marx's theory of primitive capitalist accumulation to validate the change-over from the formula C-M-C to M-C-M in *Capital* volume 1. This supplied the rationale for the *practice* of Soviet collectivisation (though *not* of the original statutes of collective farms, which were violated by political and terroristic fiat) as also of the bias against markets and trade in a socialist economy, which persisted till very recently.

(4) Marx's models of the 'imperialism of free trade' and of protection under capitalism, which were more or less independently re-discovered in controversies over interpretations of NEP (New Economic Policy) in the 1920s.

(5) The Marxian model of 'the whole of the (national) economy organised like a single giant trust', endorsed by Lenin in *State and Revolution* and put into practice (along with a fragment of the 'primitive socialist accumulation' model) in the era of war communism, and (perhaps) during the Nazi occupation of one-third of the territory of European Russia.

(6) Code-named 'the Law of Value', Marx's model of transformation of (labour-embodied) values into prices of production (*Capital* volume 3), and to a much lesser extent, Marx's discussion (also in *Capital* volume 3) of the transformation of 'Market values into Market prices'—have been reference points for almost all discussions of socialist pricing of the Marxian kind in the USSR and the people's democracies. (However, Marx's theory of absolute ground rent *contraposed* to the Ricardian theory of differential rent without which his 'theory of value' cannot be understood in its final

approximation, has suffered from gross neglect.)

(7) Marx's model of 'socialism, the first stage of communism' where absolute and relative scarcities enjoin a commodity economy based on the principle of 'from each according to his powers, to each according to his work', sketched in his *Critique of the Gotha Programme*, has been the reference point of all discussion of the role of incentives and wage-income differences in socialist economies.

(8) Lenin's model of capitalism where competition has been replaced by industry-wide monopolies as the 'material basis' of socialism, foreshadowed in some of Engels' *Notes on Capital*. This has been the ideological basis, seldom explicitly acknowledged, of the strategy of amalgamating firms into Big Economic Organisations (BEOs) in the USSR, Poland, Hungary, the German Democratic Republic, Bulgaria and Romania extensively discussed in Das Gupta's book.

The material compiled by Das Gupta in his narrative is sometimes related to the logic of these Marxian models of socialism explicitly, and sometimes not. But they make better sense when related to one or the other of these models. The change-overs from one of these models to another in European socialist societies have been instances of 'revolutionary restructuring' or perestroika, with mostly negative political openness or glasnost, according to the changing circumstances of international and national politics, economics and technology, in the past 70 years. There have even been brief spells of positive glasnost, especially when the Bolsheviks allied briefly with the Left Socialist Revolutionaries in a coalition government in November 1917, or when in the twenties the Bolshevik Party refused to allow inner-party struggles to be converted into outer-party struggles with death penalties, imprisonment for life and exile imposed on victims of a majority dictatorship within the Bolshevik Party (or other parties belonging to the Communist International).

Thus, the materials brought together in this book remind us that the current perestroika is by no means the first, nor is the current glasnost (to which, however, Das Gupta's compilation relates only very indirectly, if at all) without some precedent. What also comes through from this compilation is that there has never been a serious debate as to whether there have been conceptual and logical flaws in any of these Marxian models of socialism which need to be corrected, and which can be corrected. However, his concluding chapter 'In Lieu of a Conclusion' does render a service by meeting this problem head-on, by sizing up the now extensive literature of socialist and Marxist dissidence, and by exploring the possibilities of applying the Marxian concept of alienation to assert that "The reform in the superstructure which aims at transcending the alienation of the party from the masses and that of the state from its citizens to pave the way for a harmonious interaction between the base and the superstructure, has to come from within and not by an overthrow of the present socialist system" (p 398).

At the time of writing this review, this may sound like a pious hope. Has not the CPSU, 'alienated from the masses' taken the first fateful step towards restoration of capitalist property relations and exploitation by parasitic rent collection by decreeing long-term inheritable rights to sub-lease farmland and factories (taken on lease in the first instance from the state for collective self-employment)? Has not the Chinese CP marched much further and misappropriated the concept of 'openness' to legislate for a regime of iron control over Chinese politics by an all-powerful inner-party majority which however, 'opens up' China to every form of exploitation by international and national capital? However, there is also evidence that if the 'alienated' Soviet and Chinese masses refuse to remain helpless prisoners of existing 'present-day socialism' they are also unlikely to jump from the frying-pan of 'existing socialism' into the fire of crisis-ridden world capitalism where, to paraphrase Marx slightly, not even the 'golden chains' but the rusty or polished iron chains of capitalism await most of them (except for a few bourgeoise workers and peasants). The explosive word 'corruption' has become the focal point of political-economic reform in China, which has set hundreds of thousands of Chinese students and also thousands of workers (one of whom has already been sentenced to death) marching. The process has also begun in the Soviet republics, more in the non-Russian republics, but also in Moscow, Leningrad and in Kiev in the Ukraine (where conservative defenders of the fundamental right of the party to be corrupt are losing in some key elections). The drive of the masses to curtail communist corruption of power is unlikely to defy the laws of nature and enthrone permanently capitalist property relations which ensure the right to corrupt and be corrupted. Das Gupta's prescription for solving problems of alienation 'within socialism' may turn out to be a prognosis as to how events will shape, as well as a prescription as to how he would like them to take shape. For 70 years repeated attempts at perestroika and glasnost have been like irreversible present-day events casting giant shadows before.

Country Specificities

As already mentioned above, the scope of Das Gupta's study is very wide: the whole of communist-managed Europe, except Albania, is covered.

The facts presented clarify several issues about pre-perestroika and pre-glasnost developments in these countries since the end of the second imperialist world war (which, it is now clear was ultimately imperialist on all three sides: the Axis side as well as on the side of the dominant partners, capitalist and the communist, of the 'anti-Hitler coalition': heroic attempts to transform it into an all-peoples' war were only partially successful).

He reminds us that neither the German Democratic Republic (where, with the now almost forgotten Berlin uprising, which shook Bertold Brecht was the first corrective to a socialism imposed by the victorious Soviet Red Army), nor in the Hungarian uprising against a corrupt regime of Hungarian communist puppets of an essentially social-imperialist Soviet communist regime, nor even in the Polish upheaval of workers led by the Solidarity movement, has there been a mass movement for the outright restoration of capitalist property relations. Even the Solidarity movement, Das Gupta informs us, "never questioned the socialist character of the state and society" (p 226), and goes on to substantiate this claim fairly convincingly by quoting Solidarity documents which are hardly known outside Poland (p 227). What will perhaps surprise most readers is Das Gupta's considered verdict, repeated even in his concluding chapter, that, contrary to the almost universal impression in the west and in India, even Yugoslavia, which has gone farthest in experimenting with the chimera of *'laissez-faire* socialism' (which is as much a contradiction in terms as *'laissez-faire* capitalism', something which neither Adam Smith nor the physiocrats ever preached), has not tried yet to restore capitalist property relations within Yugoslavia, as much as China, or even the USSR (with its sub-leasing decree) has done. By documenting the little-known facts of Romanian economic reforms (with *no* political reforms whatever) he drives home the point that even the most conservative communist-managed regime in existence (with the possible exception of Albania) has not been entirely immune to at least some attempts to invoke 'change to resist change', which has never succeeded elsewhere (least of all in Poland or Hungary) to fend off genuine change indefinitely.

However, what has just been noted is in sad contrast to what appears to be a large blind spot as regards the serious attempt to 'humanise socialism' by the Czechoslovak Communist Party under the leadership of Dubcek, which probably had at the time a higher proportion of workers as members than any other ruling Communist Party (with the possible exception of the CPSU). If ever there has been a serious attempt from within a ruling CP to disalienate the party and to establish a genuine socialism under the collective self-management of producers, and to challenge, without adventurist excesses, Soviet social imperialism imposed on the basis of the Brezhnev doctrine, it was this one. But the entire episode is dismissed by the author in a cryptic, non-committal reference to the 'situation of 1968 ultimate-

ly leading to Soviet intervention...and the ouster of Dubcek' (p 251).

OBJECTIONS

There are some other omissions in the book to which objections can be raised. There are also some arguments which are hard to understand, and still harder to accept. Some of these are advanced by scholars in communist countries, which have been recorded without criticism by the author. Others relate to the author's own remarks.

To the first category belong several statements on technical economic matters. The most remarkable is an argument by N A Tsagolov, introduced by Das Gupta as 'the eminent Soviet economist' which seeks to treat variable and fixed capital as being on the same footing with a distinction being made between 'advanced and actually utilised capital in a year (which) are not the same except in rare cases' when the turnover period is one year (p 71). For some purposes, one may simplify analysis by assuming a uniform one-year turnover period, and that the wage (i e, variable capital) is advanced for one year. But in that case, it is also 'utilised' over one year unless the worker is a bonded labourer. Another is the amazing statement of Soviet scholars quoted in German translation dated 1974 that the 'transitional stage' of the lower stage of communism or socialism referred to in Marx's *Critique of the Gotha Programme* refers to (1) the period of restoration of the socialist economy 'to the level before the revolution', and (ii) *ergo* 'there was a transition period from 1917 to 1937 in USSR satisfying the contention in the *Critique of the Gotha Programme' (sic)* (p 50). In this case, of course, Das Gupta does record that he 'does not agree with the contention that the period from 1917 to 1937 conforms to what Marx described as the transitional phase' (p 50). But then, Das Gupta is ambiguous on the all- important question of whether ground rent should or should not be included in socialist price formation (pp 272-73, 305) and he puts forward an at best unnecessary, and at worst convoluted argument that 'utility' in standard economic parlance is not the same as 'use values' in Marxian terminology (p 279), and that the latter express 'physical and mental satisfaction of a person' which are not *(sic)* 'reflections of subjective factors as utility is' (p 280). What then are 'subjective factors' connected with satisfaction? Psychic satisfaction which is neither 'physical nor mental'? What will perhaps worry a Marxist political economist more than this esoteric hair-splitting is the author's ambiguous position on the untenable phrase 'non-capitalist path of development', although he does challenge Soviet Scholars who try to legitimise the concept in a misapplication to "the transition of (contemporary) developing countries (such as India) to socialism through bypassing the capitalist stage of development by harking back to Lenin's characterisation of pre-capitalist Turkestan's transition to socialist property relations"(pp 66-67). Does he reject this false, non-Marxian perspective or not? It is the considered view of the reviewer that there can be no such thing as a 'non-capitalist development' in the epoch of world capitalist imperialism which is not socialist in terms of Marxian concepts, and the question of its empirical verification does not, therefore, arise.

PHILOSOPHY

Finally, it is now clear that Marxists and Marx-interested social theorists, including the 'activistic' ones, must engage in radical re-thinking in the search for new starting-points for communist-managed socialist societies at every level: technological, economic, political, and, not least, philosophic. Das Gupta does go deep into philosophic questions, but there are some disconcerting remarks. What does he mean by saying that "The theory of knowledge which answers... the question of what we understand by the term 'reality' in a given set of conditions,... did not remain the same for the two systems" after the establishment of "different economic systems", after which "It became generally accepted...that the reality cannot be the same or unique...it became segmented into different systems with dissimilar world views (weltanshauung) for interpretation. But interpretation of the course and nature of socio-economic development does not depend on world views alone, but on important conceptual and practical questions as well. This is what has been accepted in this analysis" (p 1). In other words, this long statement seems to say that 'world views' (weltanshauungs) are emphatically not to be confused with 'views of the world' (which subsumes knowledge of all clashing 'world views', and *also* all concepts, *as well as* all (objective) 'realities out there', outside the mind). But if this is so, how can the author *also* say that "...the essence of one of the important modifications of the law of value in socialism" is the one by which "the so called 'metaphysical' category of 'value' (or socially necessary labour expenditure embodied in a unit of a commodity) by conscious effort is led to correspond to a real category (i e, the planned price)" (p 318)? Does the author endorse the extreme de-constructionist Althusserian doctrine that there is in the last analysis an 'impassable gulf' between metaphysical 'world views' and social realities about which these world views are concocted? If so, is he not agreeing with rather than rejecting the 'generally accepted view', with the disastrous corollary that no one who accepts capitalism can ever be convinced to become a socialist, since there is no way by which anyone can cross from the 'world view' of bourgeois knowledge to the view of the world of socialist knowledge?

Das Gupta closes his book with a welcome stricture against 'radicalism in the west' whose radicalism often "boils down to inconsequential scholasticism and attacks on...'existing socialism' ", because "they are more keen to transfer their stagnant 'intellectual technology' whether it is Marxism,

socialism, anti-Marxism and anti-socialism to the third world" (pp 398-99). This needed saying, and I can understand his indignation. Many years ago, I came across such a western radical's review of a book written by an Indian on Marxian political economy (with specific applications to the conditions of developed and underdeveloped capitalisms and socialisms). *Inter alia*, this western radical questioned the right of an Indian to analyse conditions under developed socialism, without, of course, forgoing his own right to do so! But it is fortunately not true that all western radicals are like Kalidas when he was trying hard to cut off the branch of the tree on which he was sitting. It is not quite true that all of them enjoy attacking 'existing socialism' because 'it does not spell any danger for them'. There are some who do realise the danger for them if socialism is obliterated, since they are urgently concerned to escape from the black future of developed capitalist societies. They criticise 'existing socialist societies' more in sorrow than in anger, as does Das Gupta himself.

Student Movement Revisited

Philip G Altbach

"Democracy Is in the Streets": From Port Huron to the Siege of Chicago
by James Miller; Simon and Schuster; pp 431, $ 19.95.

THE radical student movement of the sixties in the United States has had an ambiguous legacy on American culture and politics. It raised the political consciousness of a generation and contributed significantly to an 'oppositional mentality' that was reflected in music and social relations as well as in politics. It drew on a wellspring of idealism which also manifested itself in the Peace Corps and in aspects of the Kennedy-Johnson 'Great Society' programmes. The movement also sowed the seeds of its own destruction through increasingly militant and ultimately violent politics. James Miller has caught the spirit of a segment of the political culture of the sixties in his study—half biography of several key movement leaders and half history of the Students for a Democratic Society (SDS), the key organisation of the period.

"Democracy is in the Streets" is valuable because it provides a discussion of some of the key people in the movement. It is incomplete and even somewhat distorted for the same reason—the choice of the group which was basically responsible for creating the SDS and shaping its early direction by no means reflects the range of political orientations of the period. Nevertheless, the book is evocative of an important period in American political life—an era lost in the cynicism of the Reagan years and the rise of the 'yuppies'. James Miller chose a dozen or so individuals to reflect what he saw as the driving force of the period—idealism, a combination of American pragmatism and radicalism, and a willingness to try new approaches to politics and social change. The key individual, Tom Hayden, remains active in American politics as a state legislator in California, husband of Jane Fonda and leader of an informal west coast liberal-radical coalition. Hayden, from a conservative middlewestern background, was radicalised at the University of Michigan, where he edited the campus newspaper and eventually joined SDS and became its most influential leader for a period. Several of the other key figures also came from the University of Michigan. Al Haber, son of a liberal college professor, was a key intellectual leader in the movement. Sharon Jeffery, another Michigan student, also assumed a leadership role. The family backgrounds, ideological orientations and activities of these, and several other leaders, are discussed in some detail. Miller uses them as proxies for political activists of the period.

The SDS, at least in the early sixties, was affiliated to the League for Industrial Democracy (LID), a social-democratic educational organisation with strong ties to several of the progressive labour unions in New York. The LID was not at all pleased with the more radical direction of the SDS, and tried, ultimately unsuccessfully, to reign in its student affiliate. They key bridge figure was Michael Harrington, an LID member and, in his thirties at the time, in touch with the student generation. Harrington had just published *The Other America*, an influential book on poverty, and was widely respected. He felt that the SDS leaders, who were new to radicalism, did not have a sufficiently strong anti-communist position. Harrington, with the hindsight of twenty years, now feels that the LID leadership was too harsh on the SDS and that the break was an error. Generational politics played a role in the development of the New Left.

A key document in this book is the Port Huron Statement, which Miller sees as one of the most important political manifestos of the period and a symbol of a new approach to American radical politics. The statement was drafted by Tom Hayden and revised at an SDS conference in 1962. It reflects the concerns of the newly politicised campus-based movement for social change. It is remarkably free of the ideological baggage of previous generations of American radicalism and is, in many ways, an 'American' political document for social change. Miller sees it as the rallying cry of a generation. He might well be too optimistic—many of the students who became politicised after 1964 had never heard of the Port Huron Statement.

The intermeshing of several political concerns is nicely portrayed in this book. Indeed, one of the reasons for the rise of the SDS was its ability to link concerns such as the newly emerging civil rights movement, anti-war issues (the Vietnam war was not yet in the consciousness of many students), and a desire to work for social equality. One of the first initiatives of the SDS was a series of campaigns to organise poor people in several 'inner city' areas. Hayden himself directed an only modestly successful effort in Newark, New Jersey. A number of SDS leaders quit the university in order to participate in these off-campus movements, but their impact on the student population was minimal. Only later, when the Vietnam war heated up, did SDS gain a massive following in the universities. Even this success proved a serious problem for the organisation, since the concept of 'participatory democracy', which is discussed in detail by James Miller, made quick decision-making difficult and hamstrung the national leadership. Indeed, several key SDS were unable to function under these circumstances.

The various changes in the SDS up to the national trauma of the 1968 Democratic convention in Chicago, when the police 'rioted' and student politics became significantly radicalised, are chronicled through the eyes of the individuals portrayed in the book. It is an effective way of bringing the twists and turns of American student politics to life. It fails, however, to take some key elements into account and does not provide a sense of the diversity of activism in the country. For example, the Berkeley student revolt of 1964, commonly seen to have started the mass student movment in the United States because of its wide coverage in the mass media, was not led by SDS and is not given much attention in this book. At the other end of the spectrum, the locally-initiated and locally-led activist movements at small (and often rather conservative) campuses around the country, some of which identified with the SDS in spirit, are virtually ignored. One cannot, of course, deal with everything in one book, but Miller's concentration on the key leaders may well distort the reality of a complex and variegated movement.

This book brings to life, as no other study has yet done, some of the people in key positions of student leadership. It follows their thoughts and careers. It shows them as sometimes confused and sometimes inspired individuals working for social change in a rapidly changing and increasingly polarised society. It tells, however, only part of the story. It does not discuss the important precursors of the SDS and it is weak on chronicling the rank and file of the movement. Yet, it is a lively and valuable book precisely because it brings at least a segment of the movement to life.

Assessment of States' Own-Tax Revenues by the Ninth Finance Commission

Pradhan H Prasad

The Ninth Finance Commission, which presented its first report in July 1988, seems to have made a notable departure from the earlier Finance Commissions with regard to the methodology of measurement of relative taxable capacities and assessment of behavioural norms with respect to the states' taxes.

INTRODUCTION

INDIA has a federal structure consisting of states, union territories and the union. There are constitutional provisions whereby certain taxes are levied and collected by the states themselves and are termed as states' own-tax revenue. Apart from this, the other sources of states' revenues are their non-tax revenues, share in the taxes levied and collected by the union (either on its own or at the behest of the states) and grants-in-aid. Share in the central taxes and the grants-in-aid which together forms the major component of the devolution of funds from the centre to the states is done on the basis of the recommendations of Finance Commissions, a body which derives its authority from the Constitution of India. Finance Commissions while making such recommendations keep in view the resource-raising capabilities and needs of the state governments. But at the same time they also take care that their recommendations do not produce laxity in the state governments' effort towards mobilisation of tax and non-tax revenues and puts premium on the wasteful use of resources. In this context, while assessing the states' tax revenues, the taxable capacities of the states and the related question of adhering to normative approach to states' taxes are referred to. The Ninth Finance Commission which came into existence in June 1987 has presented its first report in July 1988.[1] Herein the commission seems to have made notable departure from the earlier Finance Commissions with regard to methodology of measurement of relative taxable capacities and assessment of behavioural norms with respect to states' taxes.

The question of concept and measurement of relative taxable capacity, which is closely related to 'ability to pay' taxes, has eluded the economists, financial advisers and administrators since the days of Adam Smith in the late 18th century. As a practical approach to the problem of measurement, the tax performance norms have been statistically estimated from group behaviour of a set of individuals or a set of regions.

Taxable capacity which is presumed to get reflected by a behavioural pattern is generally accepted to depend on income and needs, which in turn depend on socio-economic conditions where the taxpayers or a group of taxpayers reside. When regional comparison is made in this context within a nation, it is generally assumed that the supply of public goods and services (which is, either free or highly subsidised or both) is evenly distributed. Then the behavioural response of regions (or states) is obtained on the basis of a mathematical tax function.

$$Z = F(P, Q, V_1, V_2, \ldots, V_n\ U) \qquad \ldots(1)$$

where Z is tax collected in the region, P is population in the region, Q is income or production of the region, V_1 is number of poor in the region, V_2 is a measure of income distribution in the region, V_3 is industrial income, V_4 is income from trade, V_5 non-primary sector's income, V_6 is numbers living in urban areas, Vj (J = 7, 8, ..., m such that $m < n$) denotes number in jth occupation, and U denotes a stochastic disturbance or error term.

It will be seen that some of the factors affecting the tax collection are overlapping. This, therefore, involves a selection of factors for a statistical treatment on the basis of theoretical reasoning. For example, a selection can be made as follows:

$$Z = F(P, Q, V_1, V_6, V_7, U) \qquad \ldots(2)$$

where V_7 is non-primary sector workers. This function can be suitably transformed (in per capita terms) by dividing each of the variables (except U) by P as follows:

$$Z/P = F(Q/P, V_1/P, V_6/P, V_7/P, U) \ldots(3)$$

The next problem is one of specifying the function in the form of a mathematical model (for regression analysis so as to minimise error sum of square, i e, ΣU^2), for example, the following form:

$$S = Y^a . H^b . A^c . B^d . e^U \qquad \ldots(4)$$

where S denotes per capita tax revenue, Y denotes per capita SDP, H, A and B denote respectively ratios of poor population, urban population and non-primary workers to population.

There are, however, two points worth noting in this context. One is that if the states are identical so far as the variables influencing the per capita tax revenue is concerned, average value of per capita tax, $\bar{S}$, minimises the $\Sigma U^2 = \Sigma (S - \bar{S})^2$ and it can be treated as a behavioural norm. The divergence from the arithmetic mean is then treated as reflecting the 'tax effort'. The other important point is that a particular state may have some factors influencing tax revenue which are specific to that state and cannot be specified in the model. For example, a region may have a topographical terrain where only motorised vehicles for transport (to the exclusion of cycle, cycle-rickshaw, bullock carts, etc) are used. Such a situation may reduce the taxable capacity of the region. Similarly, a region may have very cold snowing weather all the year round which enhances the relative cost of living and thereby reduces the taxable capacity of the region. These are some of the extreme illustrations to drive home the fact that some

TABLE 1

States	Percentage of Tax to SDP in 1984-85				Per Capita SDP (Rs) in 1984-85 at Current Prices
	Actual	Our Normative Estimates	Ninth Finance Commission's Estimate		
			Normative	Moderated Normative	
(1)	(2)	(3)	(4)	(5)	(6)
Andhra Pradesh	9.0	8.7	8.2	8.6	2267
Bihar	4.1	4.3	5.4	4.7	1517
Gujarat	8.3	8.9	9.4	8.4	3224
Haryana	8.7	8.2	7.6	8.2	3249
Karnataka	9.3	8.5	10.4	9.9	2431
Kerala	9.7	9.8	9.2	9.7	2348
Madhya Pradesh	6.9	6.4	5.0	6.0	1836
Maharashtra	8.3	7.9	8.4	8.3	3493
Orissa	4.3	4.2	5.9	4.9	1902
Punjab	7.7	8.0	7.1	7.4	4097
Rajasthan	6.8	6.9	4.4	5.6	1907
Tamil Nadu	11.2	11.8	8.6	9.1	2254
Uttar Pradesh	5.9	5.8	5.7	5.8	1618
West Bengal	6.4	7.2	9.3	7.4	2423

unspecifiable factors as weather, topographical, and social conditions and the 'tax effort' which though cannot be specified in the model, can nevertheless affect the tax performance either way, positive or negative. Moreover, the specifiable factor cannot all be possibly included in the model because their numbers may be too large. However, when the technique of regression analysis is adopted to estimate the tax performance behaviouristic norm for the states, the inclusion of state dummies in the regression analysis is done with a view to have a qualitative estimate of these so far they are state-specific, otherwise, they form the part of residuals.

Model

The model which was used for determining the taxable capacities and tax efforts of the states by the commission is $R = Y^a . M^b . X^c . e^U$ where R denotes per capita tax revenue, Y denotes per capita SDP, M per cent of non-primary sectoral SDP to total SDP, X the Lorenz ratio of consumer expenditure distribution computed from the 38th round of NSS data (Ninth Finance Commission, Annexure, p 39). A pooled time series (1980-81 to 1985-86) and cross-section (14 states) observations with time dummies and state dummies were used for the results obtained through multiple regression analysis. In order to improve the explanatory power of the regression estimate, the states were divided into three groups and the final results were obtained. The above model, alongwith time and state dummies, explained more than 99.9 per cent of the variation (Ninth Finance Commission, Annexure, p 41).

In interpreting these results, it seems that the commission has accepted the position that the estimated coefficients of state dummies is indicative of tax effort of the state government. The 'residual approach' was rejected and the dummy variable approach was adhered to so as to isolate and estimate the extent of impact of the tax effort on the tax performance (Ninth Finance Commission, p 13). What is not realised is that this substitution is of no avail in this context. It is a well known fact that whenever a new variable is added to a regression model, part of the random error of the previous model gets explained by the parameter of the new variable (even a dummy). It is, therefore, improper to presume that the part of random error reflected by the dummy is due to the 'tax effort' alone. In case the whole of random error gets reflected (i e, when $\bar{R}^2 > 0.999$), this presumption is altogether untenable. What is assumed here is that the state-specific factors' impact on the tax performance is wholly due to the tax effort of the state government. Thus, the commission takes a position that the 'per capita tax revenue' depends only on the four factors, that is, the per capita SDP, the proportion of non-primary SDP to total SDP, the Lorenz ratio and the tax effort of the state

governments. No economist worth his salt will accept this position in the Indian context.

It has been a gross miscarriage of justice that the state-specific factors' impact on the tax performance, as revealed by the coefficients of state dummies, has been wholly attributed to tax effort of the state governments. It may also be worth recalling here that the dummy variable has a very limited role. It, at best, can indicate whether the sample which is represented by the dummy, belongs to the same population or not and if not, is it higher or lower than the specifications. But it cannot indicate the magnitude as to how much higher or how much lower. For example, from the negative sign of the dummies in the regression results, the inference has been drawn that the three eastern states (i e, Bihar, Orissa and West Bengal) show poor 'tax performance' (Ninth Finance Commission, Annexure, pp 40-41). This ordinal measurement only signifies that, say, Bihar's poor 'tax performance' is relative only to the states in the low income group. One, therefore, cannot reject (on the basis of this result) the assertion that Bihar's tax performance is better than that of Punjab. The very purpose of the analysis, thus, seems to have been lost. Moreover, the model used for this purpose is bad both from the point of view of economic theory and mathematical logic (as is evident from the comparison with the one given by equation 4 above). Yet another serious error arises from the fact that the number of observations were less than what is essentially required for the use of dummy variables. The parameters estimated in the three income groups, high, middle and low, are 11, 12 and 12 respectively. The observation for each state has been six (or even less) and for each period four in the high income group and five each in the other two. The essential condition is that the number of observations for each class for which a dummy is used must be higher than the number of parameters to be estimated.[2] It appears that it is the anxiety to improve the efficiency of the estimates by mechanical use of statistical tools rather than theoretical consideration and strict adherence to the technique of statistical and econometric analysis which is finally responsible for this utter messy result (Table 1, Columns 4 and 5).

Alternative

The alternative is to use a model which is not only based on sound economic reasoning and mathematical logic but gives a high value of $\bar{R}^2$ and the residuals may then be attributed to the 'tax efforts of the state governments' even though it may not be wholly so. The residuals, in fact, include all the factors which are not either explicitly or implicitly included in the model (inclusive of the tax effort of the state governments). One such attempt was made but the $\bar{R}^2$ (=0.7111) was not very high.[3] However, it provided some empirical support to the hypothesis that poor states in order to mobilise resources for boosting their plan efforts are rather indulging in a level of taxation which may be injurious to their state economies. This also throws a damper on the grouping of the states in the context of the tax performance.

As an illustration, tax performance behavioural norm can also be estimated by the model given in equation 4, say, for the year 1984-85 using only cross-section data of the 14 major states. The data for the analysis happens to be comparable SDP and per capita SDP from the report (Ninth Finance Commission, Annexure, pp 27-28), other sectors' SDP from *Estimates of State Domestic Product (1970-71—1986-87)* by Central Statistical Organisation, poverty-population ratio from *A Technical Note on the Seventh Plan of India* by the Planning Commission, States' Own-Tax Revenues from the *Reserve Bank of India Bulletin*, November 1986 and other population data from *Paper-2 of 1983* of Census of India, 1981. The results are as in Table A.

Table A

Variables	Regression Co-efficients	t-values
1 Constant term	3.3832	1.7334
2 Per capita SDP	0.0014	0.0061
3 Percentage of rural poor to population (computed from 38th round of NSS	−0.5480	−4.0481
4 Ratio of urban to total population, 1981	0.5727	3.8908
5 Ratio of non-primary workers to population, 1981	0.7822	4.9063

$R^2 = 0.9785$, $\bar{R}^2 = 0.9689$

Table B

Variables	Regression Co-efficients	t-values
1 Constant term	4.9591	2.7344
2 Per capita SDP	−0.5859	−1.7219
3 Per capita non-primary SDP	0.5749	2.1251
4 Percentage of rural poor to population	−0.6635	−5.2240
5 Ratio of urban to total population	0.4391	3.1423
6 Ratio of non-primary workers to population	0.6301	4.1188

$R^2 = 0.9863$, $\bar{R}^2 = 0.9778$

Efficiency of estimates are reasonably good, as is evident from the value of $\bar{R}^2$ The efficiency can be further improved if one more explanatory variable, per capita non-primary SDP, is added in the model. The results are as in Table B. Even if the entire 1.37 per cent of the variance in actual tax revenue of 1984-85 is attributed to tax effort of the state government, not much injustice seems to be perpetuated. This is basically a question of judgment and there is no econometric or statistical method known (till date) which leads to avoidance of such a judgment. Mathematical models or computers cannot absolutely negate the role of mind. They only reduce the range of arbitrariness. The behavioural state-tax norms which have been computed from S-cap (or $\hat{S}$), is given in Table 1, column 3. The problem of multicollinearity herein is relevant only when one is interested in the significance of the variables *per se*; but neither the combined effect of the variables (i e, overall explanatory power of the equation) nor the normative estimate is affected by it. It will be seen that among the low income group states, ony two (i e, Bihar and Rajasthan) are showing slightly poor 'tax effort', but Gujarat's and Pujab's (who belong to the high income group) performances are still poorer.

Notes

Measurement of States' Taxable Capacities
Ninth Finance Commission's Methodology

Dipankor Coondoo
Robin Mukherjee

The efforts made by the Ninth Finance Commission, as required by its terms of reference, to develop a methodology for estimating the taxable capacity of states should be welcomed. However, there are a number of problems, many of them technical in nature, with the methodology adopted by the commission and it should therefore be subjected to critical examination.

THE First Report of the Ninth Finance Commission (NFC) has already evoked considerable discussions in government circles, particularly at the state level, as well as among economists. While the report has been complimented for a number of unique features, criticisms have also been made that the scheme recommended for 1989-90 is regressive and the "approach to its main award for 1990-95 and its target for phasing out revenue deficits at all levels by 1994-95 are bound to adversely affect equity, welfare and growth" [Guhan, 1989].

Perhaps the most significant departure of the present report from the earlier ones was prompted by the terms of reference of the commission requiring it to adopt a normative approach for assessing the receipts and expenditures on the revenue account of the states and the centre. There should not be any dispute that *ad hocism* should be dispensed with as far as possible and therefore the attempts made by the commission, as required by the terms of reference, to develop a methodology for estimating the taxable capacity of the states should be welcome. It seems, however, that there are a number of problems, many of which are technical in nature, with the methodology and it should therefore be subjected to critical examination. The purpose of this note is to draw the attention of economists and econometricians to this important feature of the report and to put forward some observations on it.

The Methodology

The methodology used by the Finance Commission for measuring the taxable capacity for 14 major states for the year 1989-90 is the regression technique. It recognises two types of factors which are likely to affect the level of per capita tax revenue of a state, viz, the factors relating to taxable capacity and those relating to tax effort, and implicitly assumes that these two types of factors are mutually independent. The observed data on per capita tax revenue are therefore regressed on a set of explanatory variables (like the per capita SDP, the proportion of non-primary sectoral SDP in SDP and the Lorenz ratio of the consumption distribution of the state) to obtain an estimated taxable capacity function for the individual states, and the discrepancy between the observed value of per capita tax revenue and the corresponding estimate is taken to be primarily due to the combined effect of the tax effort variables which are omitted in the regression specification. The pooled cross-section and time series data for the states have been utilised to estimate a single function for taxable capacities by introducing statewise and yearwise dummy variables. On observing the non-homogeneity of the estimated taxable capacity functions across all the 14 states considered in the analysis, the states have been classified subsequently into three groups (in terms of the level of per capita SDP) in an effort to obtain three distinct groups of states each having a homogeneous taxable capacity function. The relative taxable capacities and the corresponding efficiency/inefficiency of individual states in terms of tax effort have been measured with reference to these estimated group-specific taxable capacity function.

The NFC methodology summarised above and the empirical results obtained by following this methodology (which are presented in the NFC report) give rise, as stated earlier, to some questions essentially of a methodological nature. These questions are important and deserve to be resolved, for the nature and the quality of the empirical results are likley to be crucially dependent on whether or not these questions can be resolved. In what follows, we briefly mention these methodological questions.

(1) *Specification of the Regression Model*

The regression model considered in the empirical analysis includes three explanatory variables, viz, the per capita SDP, share of non-primary sector in SDP and the Lorenz ratio of consumption, taken to capture taxable capacity of a state, and a Cobb-Douglas type functional form relating per capita state tax revenue to these variables has been employed. As already mentioned, the methodology presupposes that the variables relating to tax effort are independent of the explanatory variables included in the regression, so that the coefficients of the explanatory variables are not biased due to the omission of the variables relating to tax effort and other determinants of taxable capacity of a state, if there be any.

Is this assumption of independence empirically justifiable? If it is not, then the consequence of omission of the variables would essentially be to bias the estimates of the included explanatory variables (taken to reflect the taxable capacity of the states) and, as a result, the estimated taxable capacity function would no longer measure taxable capacity of the states. Doubts about the assumption have already been expressed by Bagchi as he writes "there is also the possibility that tax effort itself is a function of the level of development of a state with increasing pressures for public expenditures and may not be an entirely exogenous factor" [Bagchi, 1989].

Another major difficulty with the specification of the taxable capacity function relates to its aggregative nature. The states collect qualitatively different types of taxes (taxable capacities in respect of which may be dependent on different types of factors, not all of which can be proxied by the three explanatory variables considered). Moreover, the composition of the state tax revenue in terms of the different tax types may be widely different across states. In such a case, the existence of an aggregate tax capacity relation as used in the NFC exercise may be questionable. Further, one would normally seek a causal justification of a regression equation used in an empirical economic analysis. Is it possible to give such a causal justification in the present case?

(2) *Analysis of Homogeneity of the Taxable Capacity Functions:*

Presumably for want of enough data, a fixed effect model of regression is taken as the basis for empirical exercise in the NFC report and an attempt has been made to estimate a homogeneous taxable capacity function across states. Given the sample size, the task of estimating a meaningful fixed effect model appears rather formidable. For example, in the case of the unrestricted model estimated by pooling the data for six years for all the 14 states, there are 84 sample observations available for estimating 62 parameters, including the coefficients of the statewise dummies in the slopes and the intercept. Appendix to the NFC report mentions that the period covered for the regression analysis was 1980-81 to 1985-86. In the main body of the report (Sec 3.5 of Ch III) however it is stated that the pooling of cross-section observations with time series was done for the period from 1980-81 to 1984-85. This would mean that the number of observations was actually 72. Is it possible to estimate any stable regression relationship

on the basis of such a scanty sample of observations?

Quite understandably, the empirical results indicate heterogeneity of the taxable capacity function across states. However, the subsequent steps that are performed to identify sub-groups of states for which the taxable capacity functions are homogeneous give rise to further questions. The principal component analysis which was performed to devise a composite development index (to be used for grouping the states) was based on eight variables. Of these, three of the first four variables (*including* per capita SDP) were earlier considered as explanatory variables in the regression analysis based on the data for all the 14 states and were seen not to explain significantly the tax revenue. As reported, the first principal component would explain 60 per cent of the observed variability of the eight development indicators, and the composite development index was constructed by using the weights implied by the first principal component. Given the fact that a reasonably large part of the variance could not be explained by the first principal component, the uniqueness of the grouping of the states based on the composite development index becomes a debatable issue. Thus, the question arises whether one could have any alternative grouping of states with homogeneous taxable capacity function. If such alternative grouping could be possible, then the sanctity of the groupwise homogeneous taxable capacity function would become questionable. Another question, which the results of the principal component analysis gives rise to concerns the specification of the functional form of the basic regression model of the Cobb-Douglas form. It is reported that the ranking of the states by the level of per capita SDP is highly correlated with that based on the composite development index mentioned above. Further, it is found that the regressions for the three sub-groups of states (classified by the level of per capita SDP) are homogeneous in respect of the slope coefficients. This possibly implies that the slope coefficients in the basic model are independent of the level of per capita SDP (i e, the elasticities of per capita tax revenue with respect to the explanatory variables are not constant). Therefore, the question arises whether the Cobb-Douglas specification of the basic regression model is adequate.

(3) *Linear Restriction on the Coefficients*

In the final stage of the regression analysis, groupwise homogeneous taxable capacity functions have been estimated by incorporating a linear restriction that the coefficients of the statewise intercept dummies within each group add up to unity. It appears that the reported regression results related to the linear-logarithmic specification of the basic regression model. If this be the case, it is not clear how a linear restriction of the type mentioned above is warranted. In the situation where the factors affecting taxable capacity are independent of the factors relating to tax effort, the effect of omission of the set of variables reflecting tax effort from the regression specification may be as follows: the mean effect of omission of these variables would result in a statewise intercept term. However, in the event some of the variables reflecting tax capacity are also omitted in the specification (which is likely to have happened in the present case), no efficiency connotation should be attached to the multiplicative state-wise intercepts. Hence, the question of normalising these intercepts does not possibly arise. Even in the case of omission of tax effort variables alone, one may, at best, postulate that the product of the state-wise intercepts (in the original Cobb-Douglas specification) is unity. In such a case, the relevant restriction in the linear-logarithmic set-up would be that the statewise intercepts added up to zero. From the reported results, it may be seen that the intercept for some of the states is negative. Thus, these are the restricted estimates of the linear-logarithmic specification (since it is impossible to have a negative intercept term in the multiplicative Cobb-Douglas specification). Now, if the linear restriction is indeed irrelevant, it is not clear whether the claim of efficiency of the estimates would be legitimate. More importantly, the effect of introducing an irrelevant coefficient restriction may very well be quite damaging so far as the estimates of the other parameters of the regression equation are concerned, and thus may significantly affect any policy conclusion based on the estimated regression equation with such an improper linear restriction.

(4) *Regression Results*

We may now pass on to the regression results presented in the appendix. It has been mentioned that a large number of functions with several combinations of variables were tried out before choosing the ones presented on consideration of their having the most satisfactory statistical properties. It is stated in particular that the reported "equations have been chosen for the purpose of making projections on three considerations": (i) the explanatory power of the equations should be high; (ii) the residuals should not have a high degree of autocorrelation; and (iii) the signs of the regression coefficients should be on expected lines.

The results show very clearly that the explanations achieved are indeed remarkably high. It turns out, however, that among the economic variables only per capita SDP is significant. In other words, SDP is found to be the only significant determinant of per capita tax revenue. But still no explanation has been provided for retaining the other non-significant variables. In fact, it is not even clear whether the regressions were re-estimated by dropping the non-significant variables and, if so, what kind of results were obtained. Secondly, since the values of the D-W statistic have been presented, one may presume that autocorrelation of the residuals was tested by using the Durbin-Watson test. The problem is how would one apply an interpret the Durbin-Watson test in case o pooled cross-section time series data Thirdly, nothing has been stated about th expected signs of the regression coefficients It is found that the estimated regression coefficient for Lorenz ratio of consumption is positive for high and middle income states but negative for the low income group. How can it be said then that the three considerations listed above were actually followed?

Conclusion

On the whole it seems that the methodology followed by the NFC is quite innovative. But there are a number of serious limitations and one may doubt if the purpose has been served. The moot question then would be to decide whether the results of the NFC methodology, as it stands now, should be accepted particularly since it has serious practical implications. We would only like to state in this context that we do not quite agree with Bagchi when he says "those who still have reservations about the normative approach based on econometric models (and some of them may be valid especially when there are severe limitations of data) have to come up with alternative approaches which would be more objective or less questionable" [Bagchi, 1988]. The fact that one does not have a better alternative at hand should not debar one from voicing objections against an existing or proposed methodology.

Cultural Foundations of a Nineteenth Century Mathematical Project

Dhruv Raina
S Irfan Habib

We investigate here the context in which Ramchandra, a nineteenth century Indian mathematician, journalist, populariser and social commentator, worked on A Treatise on the Problems of Maxima and Minima. *The work was original in that it sought to obtain the maxima and minima of a function from algebra and without using differential calculus. The project itself was nourished by the notion of algebra as a cultural metaphor, and it is on this count that it attracted the attention of the British algebraist Augustus de Morgan.* The Treatise, *when placed against the background of Ramchandra's stance* vis-a-vis *the colonial educational policy, clearly reveals the beginnings of a still nebulous anti-colonial politics, insofar as its professed objective is a mathematical revivification of an intrinisic but dormant algebraic predisposition of the Indian mind.*

Introduction

BY the first half of the nineteenth century, the *avant garde* of the Indian intelligentsia had acquired an appreciation of science, that was tailored to their socio-political expectations. Amongst other things, it provided them with a secular forum for the articulation of a politics of change, irrespective of their religious persuasion. Ramchandra (for a short biographical sketch, see appendix) hitherto studied as a man of letters, pioneer of modern Urdu journalism and social commentator, was also a mathematician and populariser of science. It is the latter dimesion of his work that we seek to explore. We have elsewhere discussed[1] the context of Ramchandra's popular science writing, and his commitment to education. In this paper, we discuss the cultural and political factors that determined the choice of his 'mathematical project'. The *raison d'etre* of this work, we attempt to demonstrate, can be located within the colonial context and the then ongoing debates on the position of algebra and geometry in a liberal education. This project is also moored in Ramchandra's commitment to the advancement of science among the Indian populace. An internalist evaluation of Ramchandra's work awaits another paper. The present study seeks to fathom why Ramchandra turned to the 'theory of equations' of a twelfth century Indian mathematician, to solve problems of elementary calculus.

Algebra as Cultural Metaphor

As stated earlier, we shall examine Ramchandra's contribution to mathematics as well as attempt to locate this enterprise within the context of the ongoing debates on mathematical research and its pedagogy in the nineteenth century. Ramchandra's two books, *A Treatise on the Problems of Maxima and Minima*, published in England in 1859 and *A Specimen of a New Method of Differential Calculus, Called the Method of Constant Ratio*, published in 1863, stand out as a mathematical project rather than a research programme in mathematics. This happens to be so, for his mathematical enterprise is (if not consciously) related to and partially determined by the given situation and Ramchandra's perception of himself as a colonial subject. Such a strong assumption might commit one to the errors of naive Marxism, according to which: 'Science can be reduced entirely to ideological norms', and 'external history is the only history of science'.[2] Although such an externalist determination may appear unwarranted,[3] for as Restivo has pointed out: '...in science autonomy and philosophical involvement are not mutually exclusive.[4] Yet the nature of Ramchandra's project lacks opacity when viewed through the kaleidoscope of his other social and educational commitments. Ramchandra's mathematical project was unique in that no other mathematician, Asian or European, at the time seemed to have considered working on it. However, at another level it can be demonstrated that the project attracted the attention of one of the leading British algebraists of the time, Augustus de Morgan, for it was related to the ongoing debates on the foundations of algebra—a debate in which Ramchandra never really participated.

Ramchandra's mathematical treatises are dedicated to reviving the Hindu and Arabic spirit of algebra, to reinstate the native disposition of these people, that had, he felt, been eroded over the centuries. This seems to have been the typical response of the colonised Indian intellectual in the nineteenth century. The revival of a glorious past was itself to become a metaphor in colonial struggle. There is, thus, the potential for an immanent act of transcendence manifest within his mathematical project, which is itself a consequence of a realisation on Ramchandra's part, of what Hodgkin in another context writes: '... we do mathematics one way, but we might well do it another'.[5]

That this was the source of inspiration behind Ramchandra's enterprise is also evident in the rationale he subscribes to, while making a case for teaching the sciences in the local languages. However, his intentions were in no way jingoistic, for his intentions were that the Indian populace be abreast with the latest developments in the sciences.[6] This is further revealed by the fact that he translated several scientific works from English to Urdu. The demand for teaching science in the local languages, as well as the attempt to devise other approaches to the teaching of mathematics, is particularly noteworthy in that it can be construed as an early critique of the later Macaulayan educational policy, designed to produce clerks.

Ramchandra's basic contribution to mathematics was in calculus and the theory of equations. This is contained in the two works mentioned earlier. In this paper we shall refer to the first text,[7] which as Ramchandra mentions in his preface, attempts to put forward a new method for solving problems of maxima and minima in which quadratics and equations of higher degree are used, and in some cases these involve two or more variable quantities. He goes on to write:

> This latter method I may venture to call a new method, because in all mathematical works I have had access to, I have never seen a single problem of maxima and minima solved by it, though it is used to reduce an adfected quadratic to a pure one in a great many works on algebra.[8]

We shall return to the treatise again, but we shall briefly discuss the influence of the orientalists and the accepted reading of nineteenth century historians of mathematics on Ramchandra. Ramchandra had been tutored in the classical Indian (Hindu and Arabic) tradition as well as the modern western tradition of mathematics, and was quite familiar with the debates confronting each tradition. Though he had read Bhaskara's *Bijaganita* in the original Sanskrit, it seems certain that he had been deeply influenced by the ideas of certain nineteenth century historians of science like Colebrooke, in particular his *'Algebra with Arithmetic and Mensuration, from the Sanskrit of Brahmgupta and Bhascara'* (1817), and the preface to his translation of Bhaskara's *Bijaganita*. On this count there are two aspects that need fur-

ther consideration. The first is the classical divide between Greek mathematics on the one hand, that was said to have geometric foundations to which the western tradition was particularly predisposed, and the traditions of Hindu and Arâbic mathematics that were considered algebraic. The other view is the superiority that Ramchandra attributes to Hindu mathematics over Arabic mathematics in a popular article written on Bhaskara in Urdu titled *Zikr Muhandis Bhaskara Ka.*[9] Before we consider the former aspect that requires greater discussion and offers a glimpse into the relevance of Ramchandra's mathematical project, let us see what Colebrooke has to say about the latter, and thus locate the context of Ramchandra's views on Arabic mathematics. Colebooke writes:

> it must be conceded in favour of the Indian algebraist, that...he appears to have been in possession of the resolution of equations involving several unknowns, which it is clear, nor fairly presumable, that Diophantus knew; and a general method for indeterminate problems, to a knowledge of which the Grecian algebraists had certainly not attained.[10]

Now, the Arabs had to translate Diophantus' *Arithmetica* to forge links between algebra and arithmetic, as well as algerbra and geometry. Since Ramchandra was conversant with the theory of equations in its contemporaneous formalism as well as that of the *Bijaganita,* he probably based his understanding of Arab mathematics in these terms. There were also Colebrooke's opening lines that reflected the now questionable eighteenth and nineteenth century perception of Arabs as scholars rather than inventors.[11] Consequently, Ramchandra's views, as expressed in his populist article on Bhaskara, to whom he traces the lineage of his project, appear as the refracted version of Colebrooke's deduction that:

> this science in a more advanced state subsisted among the Hindus prior to the earliest disclosure of it by the Arabians to modern Europe.[12]

The purpose here is not to initiate a purposeless priority dispute, either in favour of Ramchandra's mathematics or Hindu algebra. What we wish to reveal here are the intellectual influences as well as the political situation that precipitated in Ramchandra's treatise.

A legacy of the nineteenth and twentieth century history of mathematics is the often contested finding that Greek mathematics was geometric and demonstrative and the Hindu and Arabic traditions were algebraic and algorithmic. Roshdi Rashed has shown how the Arab mathematician Al Mahani forged linkages between algebra and geometry to study and thereby derive a theory of cubic equations, this study being catalysed by the demands of astronomy.[13] Within the tradition of Hindu mathematics too, we observe geometric and astronomical instances in the texts of Bhaskara, but the majority of them are numerical. Consequently Colebrooke remarks that the Indian mathematicians: cultivated algebra much more, and with greater success than geometry; as is evident from the comparatively low state of knowledge in the one, and the high pitch of their attainments in the other.[14]

This, briefly, was the accepted understanding of the different mathematical traditions in the early nineteenth century. Ramchandra's treatise was sent to the British algebraist Augustus de Morgan, who canvassed for its publication in England and circulation in Europe, and even wrote a very detailed and refreshing introduction to the book.[15] But before going into the treatise itself, it should be noted that it is within the framework of the foregoing discussion that De Morgan situates the purport and merit of Ramchandra's treatise. Like other mathematical thinkers of the time De Morgan also accepts that: "The (Hindu) sought refuge from arithmetic in algebra, the (Greek) sought refuge from arithmetic in geometry. The greatness of Hindu invention is in algebra."[16] Having said so much he pins down Ramchandra's effort as an essentially algebraic one: "Ramchandra has a much stronger leaning towards geometry than could have been expected by a person acquainted with the *Bijaganita,* but he has not the power in geometry which he has in algebra."[17]

Ramchandra's project commences from where the algebraic *Bijaganita* stops, to deduce an alternative way of solving simple problems in calculus. This project then is nourished by algebra as a cultural metaphor, which as Spengler would put it, can be defined and serves as mathematics usually does as a: 'principle of ordering.. the soul of that culture. Consequently there are more mathematics than one.'[18]

THE 'RAMCHANDRA PROBLEM'

Given Ramchandra's educational background, the fact that he was a teacher at Delhi College, the political and intellectual influences that went on to constitute the consciousness of the Indian intellectual with a western education, he set out on a distinct mathematical enterprise—*The Treatise.* That the problem was an original one in its own right is testified by the fact that it had never been addressed in the framework within which Ramchandra had posed it. From the theory of equations as set forth in the *Bijaganita,* Ramchandra attempted to obtain the maxima and minima of a function without taking recourse to the preliminaries of modern calculus or geometry. As De Morgan puts it "Ramchandra's problem—I think it ought to go by that name, for I cannot find that it was ever current as an exercise of ingenuity in Europe—is to find the maxima and minima".[19] Given a function $\phi(x)$ and $\phi(x+h)$, compare their values, but no procedure that indicates the nature of the relation between $\phi(x)$ and the derived function $\phi'(x)$ is permitted. The problem is to obtain a constant r, such that the function $\phi'(x-r)$ has equal roots, 'without assuming th[e] development of $\phi'(x+h)$, or any of its con[-] sequences'.[20] Consequently, the metho[d] does not take any recourse to differentia[l] calculus.

But then historians of science will ask whether this project resulted in a differen[t] procedure of doing calculus? Since th[e] mathematical works of Ramchandra hav[e] been marginalised, despite the canvassing o[n] De Morgan's part, one has still to researc[h] the problems it resolved and the ne[w] pathways and problems for future researc[h] in mathematics that it opened up. But D[e] Morgan does make a comment that socio[-] logists of science would be quick to gravitat[e] towards:

> a short paper, with a few examples, woul[d] have sufficed to put the whole matter befor[e] a scientific society. But it was Ramchandra'[s] object *to found an elementary work upon hi[s] theorem, for the use of beginners, with a large store of examples...* (the emphasis i[s] ours).[21]

Ramchandra might well have published a paper in a concerned journal of a mathematical society, and thereby entered into a system of practices wherein his work be considered or ignored on very different grounds. But his purposes, as has been repeatedly pointed out, were pedagogic, a pedagogy designed to rejuvenate and update the supposedly algebraic predisposition of the Indians. However, his works were mauled within India, particularly in Calcutta,[22] which a few decades later would be the epicentre of the Indian renaissance. However the right honourable Bethune[23] was highly impressed by the work of Ramchandra and forwarded it to De Morgan for comments.[24]

THE RAMCHANDRA-DE MORGAN EXCHANGE

One of the failings of this section is that we have not been able to trace the bulk of the correspondence between Ramchandra and De Morgan. We have largely relied on De Morgan's correspondence with the authorities in England to arrange the publication of Ramchandra's work and disseminate the study among mathematicians in Europe. Secondly, we have based our reading on the much quoted preface of De Morgan, that contains extracts of Ramchandra's letter to him. However, prefaces generally tend to be laudatory but it should be remarked that Ramchandra's book was first published in India. The book was later brought to the notice of De Morgan, who campaigned for its publication in England at the expense of the British government, and later worked towards the subsequent dissemination of the work throughout Europe. Secondly, the content and idiom of the letters addressed to the British authorities hardly differs from that of De Morgan's preface. It may also be conjectured that it was the first book by an Indian mathematician published in England in the nineteenth century. More importantly, the understanding of De Morgan runs

gainst the grain of the imperial policy of he time. So in much of what follows, we will e viewing Ramchandra as he comes hrough to De Morgan.[25] In his correspondence with the British authorities and he preface, De Morgan stands out as a eretic in a colonial age. For even well into he twentieth century, the mathematician G H Hardy, who discovered and collaborated with Srinivasa Ramanujan, felt that he tradition of Indian and other non-Greek raditions of mathematics, were nothing other than a collection of exotic tricks.[26] One does not have to cite other histories of nathematics that regurgitate similar opinions. But it ought to be remarked that they are counter-balanced by the more balanced works of Cajori, Struick and others.[27] In a long and rather unusual letter to the English authorities, where he canvasses for the publication of 'Ramchunder's' book, De Morgan enters into a protracted discussion of Bhaskara and the *Bijaganita*, which he was familiar with through Colebrookes' translations, he writes:

> I have paid more attention to the dawning of science in many countries than is usual, being one of the very few mathematicians who have studied the early history of mathematics long and closely.[28]

In the light of this understanding of the 'dawning of science in many countries', De Morgan felt that the native Indian genius for mathematics had fallen into decline (a notion prevalent among the burgeoning Indian intelligentsia well into the twentieth century and exemplified in the writings of the first Indian historians of science in India, B N Seal, P C Ray, etc). Consequently, De Morgan as representative of the liberal consciousness[29] felt that attempts must be made to resuscitate that native genius, in his own words, 'to promote' the 'native effort towards the restoration of the native mind in India'.[30]

Since that genius expressed itself algebraically this work must be seen as an effort to appropriate the latest developments in mathematics (like calculus) within their own native idiom. Ramchandra's project seeks legitimation in the fact that it is directed at the native Indian traditions and their autochthonous perception of mathematics, rather than express itself entirely in the language of the 'imported science of his teachers'.[31] De Morgan writes to the British authorities:

> My immediate conclusion was that it would be of the highest importance to the restoration of Indian science as an instrument in the restoration of Indian mind that Ramchandra should receive encouragement.[32]

In concluding this section, it must be reasserted that the mathematicians of that time might have judged Ramchandra's project as an exercise in doing the same thing in a different way, but De Morgan disagrees insofar as he visualises another role for it in the climate of nineteenth century India, as well as its pedagogic relevance to England and Europe. The latter part shall be raised again in the next section.

Locating Ramchandra's Treatise

It might be necessary to digress a little into De Morgan's mathematical commitments, in order to locate the source of his empathy with Ramchandra's project, and thereby situate the project itself within the broader perspective of the history of mathematics in the nineteenth century. There are at least three levels within which it is possible to locate De Morgan's appreciation of Ramchandra's work. It must be noted that these three levels do not bear the remotest correspondence with the three stages of De Morgan's intellectual development, identified by Pycior.[33]

The first level really appears quite trivial, but deserves mention for De Morgan repeatedly does so, and this we shall call the level of emotional empathy. This had to do with the fact that De Morgan was born in India on June 27, 1806 at Madurai and preserved some sort of emotional links with it.[34] In the preface to *The Treatise* he writes that 'my own birth and descent have always given me lively interest in all that relates to India'.[35] Or again in a letter to the British authorities where he makes a case for Ramchandra's book he states:

> I have always regarded the old science of India with peculiar attention having been born in that country of ancestors who had been in the company service since the reign of Queen Anne.[36]

This further explains the appreciation of an European mathematician of the nineteenth century, of a non-European tradition of mathematics. The second level relates to De Morgan's active involvement in formulating the syllabi for mathematics in general and algebra in particular, in British schools and colleges. In fact, the principal objective of his work during the first stage of his career as a mathematician was to justify the place of algebra as the 'basic component of a liberal education'.[37] In 1831, De Morgan further reiterates his pedagogical commitment as follows (a careless pedagogical approach to algebra):

> ...will ensure years of travelling in the dark, besides the certainty of accustoming the young mind to implicit belief in apparently contradictory propositions.[38]

Being so closely involved with British education, he was to confront problems that were fundamentally algebraic, such as those associated with negative and imaginary numbers,and thereby with the pedagogy of mathematics teaching. Given his understanding of the Indian mathematical tradition and what he perceived to be the difficulties in teaching mathematics, De Morgan was quick to recognise the significance of Ramchandra's work, as a heuristic or pedagogical device. Its pedagogical relevance and contextuality, in nineteenth century India has already been discussed, for De Morgan chides the colonising pedagogues:

> Europe must remember that his purpose is to teach Hindoos, and that probably he knows better how to do this than they could tell him.[39]

But then like all good mathematics Ramchandra's method ought to have had some relevance outside India too, and De Morgan suggests that selections of the work be introduced in elementary courses in England. In particular, De Morgan recommends the exercise in quadratic equations:

> which...would advantageously supersede some of the conundrums which are manufactured under the name of problems producing equations.[40]

Finally, there is the third level that has to do with the ideas both Ramchandra and De Morgan harboured about algebra, and their commitments to it. At this juncture one must take note of the debates on algebra that took place in England in the 1830s which centred around the proponents of a symbolic algebra and an abstract algebra. De Morgan was a party to these debates, while Ramchandra pursued his problem untouched by them. But Ramchandra's problem was peripherally related to De Morgan's concern about algebra. During the second stage of his intellectual development, De Morgan subscribed to a 'modern, abstract approach to algebra', while in the third stage (late 1830 onwards), he moved towards a more 'meaningful algebra', of signs and symbols.[41] If we assume that De Morgan encountered Ramchandra's *treatise* during this stage (the dates agree chronologically) then his remark—"I found in this dawn of the revival of Hindoo speculation two points of character...The first is the leaning towards geometry"[42] —stands explained. But then as one who had once leaned towards a modern, abstract algebra, he was also taken up by what is normally a problem of differential calculus, but hitherto had hardly been considered within the 'possibilities of pure algebra'.[43]

In the light of this argument, suppose then that Ramchandra's project stands established as committed to stepping beyond the pedagogy of mathematics teaching of his time, inevitable questions surface. Why did not anybody follow up on Ramchandra's treatise? Why did not this pedagogy find a niche in the mathematical syllabi of Indian schools and colleges. This is rather surprising because Ramchandra was well placed in the academic and government circles in Delhi—at least before 1857. In short, why did this entire project die out?

We still have to determine whether Ramchandra's method was exhausted by the immediate problem (of obtaining the maxima and minima without using differential calculus) it was addressed to? But then that would merely provide us with purely internalist factors. To answer the questions raised above, it is increasingly relevant to investigate the colonial context, wherein both the definition of, as well as areas for, scientific research were handed down by the col-

onisers. The latter was probably (for it remains to be established) the case in the nineteenth century. The introduction of western science in India in the nineteenth century did not precipitate any pitched battles with the theocracy, as happened in the Europe of the seventeenth century. As Gosling points out, educated Indians perceived no threat from Darwin's theory which they assimilated unlike the Victorians.[44] However, science contrary to undermining religious beliefs and thereby serving the purposes of evangelicals like Grant, Wilberforce and others in the eighteenth century, was becoming a weapon of defence against the western ideas and religion in the nineteenth century India. Gosling observes that a theme which appears in all four decennial missionary conferences of 1872, 1888, 1892 and 1902 is the ability of the Hindus to use western scientific and rational arguments to attack Christian teaching.[45] If science was a tool in the struggle against western ideas and religion in nineteenth century India, then Ramchandra's attempts in arriving at another way of solving problems of maxima and minima, was a mathematical victim in the then nebulous battle against the cultural imperialism of the colonisers, at least in the realm of ideas.

Appendix

Biographical Sketch of Ramchandra

Ramchandra was born when Delhi had, for all practical purposes, passed into the hands of the British. There was a mughal emperor on the throne, but power was virtually in the hands of the "company bahadur". The people of Delhi were dependent on the British for their social as well as their economic security and welfare. Some radical, political and economic changes had taken place. The cultivators were beginning to feel the brunt of the ongoing commercialisation of agriculture. The nobility had been shorn off its pageantry and power. There was a middle class who were as usual changing masters. The mughals left and the British walked in.

Ramchandra was born in a middle class Kayasth family in 1821 at Panipat. His father, Rai Sunder Lal Mathur, an employee of the revenue department of the company, did when Ramchandra was just nine. Consequently, Ramchandra was brought up and educated by his mother who suffered innumerable economic hardships. He had his early education at home and was admitted to an English school in 1833. Ramchandra excelled at school and acquired a reputation as a bright student, particularly in mathematics. He pursued mathematics on his own, since there were no special arrangements for teaching the subject at school. This early interest laid the foundation on which rested his future reputation as a mathematician.

When he joined Delhi College, Boutros, the then principal, had already started translating European scientific works into Urdu. Ramchandra got involved in this project, first as a student and later as a science teacher in the college. In 1843, these activities were formalised under the aegis of the vernacular translation society. Ramchandra's paper, *Fawaid-ul-Nazrin*, was initially published by this society. In 1846, at the initiative of Sprenger, principal of the college, another weekly, *Qiran-us-Sadain* was started by Ramchandra. This paper sought to bring out what was good in the cultures of the east and west and also present a composite viewpoint before the people. The paper carried articles on new inventions, discoveries and research in modern science and technology.

Ramchandra wrote his famous book on mathematics, *A Treatise on the Problems of Maxima and Minima* in 1850, when he was just 29 years old. This book created a stir in academic circles and his fame as a mathematician travelled as far as Europe. There were also some critical reviews, like the one published in *Calcutta Review*, to which he replied during his visit to Calcutta in 1851. This book was published again in 1859 from London, at the initiative of Augustus De Morgan who campaigned for its publication and distribution abroad.

He was an active participant in the deliberations of the Delhi society established on July 28, 1865. This society had, besides Ramchandra, Mirza Ghalib, Syed Ahmad Khan, Nawab Alauddin Khan Alai and Munshi Pyare Lal Ashob as active members. Other than social reform, the society emphasised the necessity of establishing a university, the introduction of a vernacular medium of instruction and the translation of several European works into the local languages.

6 David Gosling, *Science and Religion in India*, Madras, 1976. Gosling points out that there were three distinct responses to the introduction of western ideas in the nineteenth century India. The first consisted in a total abandonment of Indian belief and an acceptance of western ideologies. The second consisted in adapting and strengthening Indian traditions with ideas borrowed from the west. Lastly, there were attempts to show that Indian thought contained all the elements required to cope with the west, but these needed to be reasserted. Ramchandra's enterprise appears to assign him to the second category.

25 Historians of mathematics have encountered a similar problem in studying Ramanujan, for other than his notebooks that contain his mathematical formulae, historians have had little other material to go by. Consequently, they have had to rely on the interviews and writings of other mathematicians, so as to construct a sensible historical account of the man and his project. Any comparison between Ramanujan's revolutionary mathematics and Ram-

chandra's project is, however, not sustainable.

44 David Gosling, op cit, further points out, "Assuming that the crux of the matter in England was the idea of a common ancestry for human beings and animals, then it is not hard to see why educated Indians reacted differently, since for them the theory of reincarnation pre-supposed such a belief"

45 In talking about Christian theology and cultural imperialism in the first half of the nineteenth century, a qualification is due. For in the southern state of Tamil Nadu, India, the Christian missionaries (in particular those affiliated to the churches of northern Europe) catalysed the development and resuscitation of the vernaculars and autochthonous traditions (R E Frykenberg, 'The Impact of Conversion and Social Reform upon Society in South India during the Late Company Period: Questions Concerning Hindu-Christian Encounters with Special Reference to Tinnevelly' in C H Philips and M D Wainwright, ed, *Indian Society and the Beginnings of Modernisation*, London, 1976, 187-243. Consequently, one has to restrict the applicability of 'cultural imperialism' in that context. On the contrary, the churches active in and around Delhi, and the church to which the proselytised Ramchandra belonged too, were usually Anglican. The nexus between the Anglican church and the imperial state, fostered, and legitimised its missionary role, through cultural imperialism.

Minority Policy in the North-East

Achievements and Dangers

Sanjib Baruah

The continuation of the British policy that aimed at protection of vulnerable indigenous peoples has led to the successful political integration of dissenting minorities in the north-east. An important part of this policy is the diffusion of a model of culturally defined political autonomy in the north-east. This assumption that there are exclusive territorially based ethnic groups that can be given autonomy may prove dangerous in the long run.

IN JUNE 1986 an accord between the government of India and the Mizo National Front ended a twenty-year old insurgency by the Mizos—an indigenous minority group of north-east India—that has sought to secede from India. In the following weeks Mizo guerrillas trekked down the hills of neighbouring Bangladesh and Burma and surrendered their weapons to Indian authorities. As part of the accord, Laldenga, the legendary leader of the insurgents, became the chief minister of the state of Mizoram and within a few months an election gave him the mandate to continue in that position.

In two years Laldenga's political party, the Mizo National Front, however, lost the state election. Laldenga himself was defeated in one of the two constituencies that he had contested. Apparently the goodwill for the underground leader had given way to an unfavourable judgment by the voters on the performance of his government.[1] Even though Laldenga charged that the election was rigged—a charge not uncommon in Indian elections and which was promptly refuted by the Indian authorities—no one suggested that electoral defeat might push the one-time rebel leader and his supporters back to the jungles.

There are two aspects to the Mizo story. On the one hand, the armed rebellion meant that Mizo guerrillas faced the military might of the Indian state and Mizo civilians suffered serious human rights violations as Mizoram came under military rule. On the other hand, the formation of Mizoram—first as a union territory in 1972 and later as a full-fledged state in 1987—permitted the resolution of the Mizo conflict and the incorporation of the disaffected Mizos into the Indian political process. The Mizo story is emblematic of the two aspects of the Indian government's policy towards indigenous minorities in the north-east.

The successful political incorporation of dissenting minority groups by giving them significant levels of political autonomy and a major say in determining public policy is an important part of the Indian record in the north-east. This, however, is not necessarily the result of an enlightened vision. This record is partly the result of the somewhat reluctant continuation of colonial policy that emphasised protection of vulnerable indigenous peoples from their more crafty neighbours—a policy that became popular among indigenous minorities even though it was out of favour in Indian nationalist circles. A second element of this policy is the diffusion of a model of political autonomy through culturally defined states that was developed mainly with respect to peninsular India. While this model was thought to have little relevance in north-east India, it shaped the political imagination of indigenous minorities there as it did that of larger ethnic groups in the rest of the country, and has proven to be an effective way of granting political autonomy within the framework of the Indian polity.

As a result of this policy the condition of most indigenous peoples of north-east India contrasts sharply with that of indigenous peoples in peninsular India and in other parts of southern Asia. The point was underlined recently when the leader of the Chin tribal insurgents in Burma—a group that is culturally contiguous with the Mizos of India—declared, to the embarrassment of the Indian authorities, that the Chin National Front was "exploring possibilities of a merger with India." He called for Indian assistance towards Chin liberation and said that "we will secede from Burma and join India, where minorities are assured of greater rights". The government of India, not surprisingly, disassociated itself from such sentiments.[2]

NORTH-EAST INDIA: THE SETTING

North-east India is on India's cultural periphery. India there begins to look less and less like the rest of south Asia and more and more like the south-east Asian cultural region. A major two-volume work published in 1967 on south-east Asia included a chapter on Assam, whose boundaries then were more or less synonymous with what is called north-east India today. As the editor of the volume put it:

> The population of eastern India 'north-east India in our vocabulary' includes a large population of tribal and minority people who speak languages closely related to languages of south-east Asia rather than to the languages of India proper, and their cultures in many ways resemble the cultures of neighbouring south-east Asian peoples. Just as the southern boundary of China does not mark a cultural or linguistic division, the eastern border of India does not mark of a cultural or linguistic area. Eastern India thus is an area where south-east Asian highlanders come in contact with a highly stratified lowland society based on caste.[3]

North-east India consists of seven states—a few of them are amongst the smallest states in India's federal structure. A large segment of the population of north-east India are, what is called, 'scheduled tribes' in Indian public policy discourse.

The tribal-non-tribal cleavage in north-east India resembles that of many south-east Asian countries. As Robins Burling put it:

> like the nations of south-east Asia, Assam [north-east India in today's terms] has a minority of tribal mountaineers who differ in many ways from the lowland majority. As in much of south-east Asia proper, the hill men live largely by Swidden agriculture; they are fragmented into dozens of linguistic groups, and until the colonial period no political system based in the plains was able to extend its control consistently into the hills. Except for recent converts to Christianity, the hill men (like most of their cousin to the east) fall under the vague rubric of 'animism' and are thus set off from their Hindu neighbours in the valley. And, as in other parts of south-east Asia, lowlanders tend to look upon the hill people as naive and primitive rustics, while they are often seen in return as wily, sophisticated scoundrels.[4]

Christian missionaries were very effective in the hills of north-east India in the 19th and early 20th century. As many as 86 per cent of the population of Mizoram, 67 per cent of Nagaland and 47 per cent of the population in Meghalaya are now Christians.[5]

As Table 1 indicates, 'scheduled tribes' constitute a major segment of the population of the north-eastern states. They constitute a majority in four of the seven states. The term 'scheduled tribe' in Indian policy discourse refers to a list that includes the names of groups that are entitled to affirmative action programmes for members of these tribes. The term tribe, however, needs some qualification. Analytically the term refers to people who live on the periphery of dominant social formations: forests and hills are their traditional habitat. Most scheduled tribes of north-east India today however, do not conform to the traditional stereotypes that are associated with the term. The Mizos, for instance, have a literacy rate of 60 per cent—among the highest in India.

The tribes are among the oldest inhabitants of the area. Tension between indigenous groups and outsiders is an important theme in the politics of the area. The issue has become politically volatile because the north-east is southern Asia's last land frontier and during the past century the area has seen extremely heavy immigration. However, the distinction between indigenous and non-indigenous peoples do not necessarily correspond to the distinction between tribals and non-tribals in the politics of the north-east. The non-tribal Asssamese of the Brahmaputra valley and the Meities of Manipur have, for instance, in recent years asserted their rights as indigenous peoples—not unlike the *Bhumiputra* (sons of the soil) of Malaysia. However, in the last couple of years the Assamese have confronted political opposition from the Bodos—a scheduled tribe native to the plains of Assam. The Bodos claim to be the original inhabitants of Assam. By contrast, say the more extremist Bodo activists, the more hinduised Assamese—whose folklore emphasises descent from im-

migrants from peninsular India rather than ethnic contiguity with the indigenous tribal population—are outsiders who stand in an exploitative relation to them.

The Exclusionary Legacy of Colonial Policy

One element of policy towards tribes that the post-colonial Indian state inherited in north-east India was the status of many parts of the region as excluded and partially- excluded areas. A government regulation of 1873 allowed the government 'to prescribe, and from time to time alter by notification . . . , a line to be called the Inner Line and to prohibit any subject living outside the area from living or moving therein'.[6] The areas beyond the Inner Line were supposed to be outside the active control of the colonial administration.

Beyond this line the tribes are left to manage their own affairs with only such interference on the part of the frontier officers in their political capacity as may be considered advisable with the view to establishing a personal influence for good among the chiefs and the tribes.[7]

Over time administrative controls, of varying degrees were extended beyond the Inner Line. But the movement of people remained restricted. The Inner Line was extended to all the hills except the Khasi and the Garo Hills—today's state of Meghalaya —and the Mikir Hills—the Karbi Anglong district of present-day Assam. The plains areas of present-day Assam and Tripura, however, were not protected by such exclusionary rules.

There are many reasons why the British adopted exclusionary rules in the north-east. The British were not anxious to extend administration to the tribal areas with the attendant political risks and financial expenses so long as there were other ways of ensuring British suzerainty. The colonial distrust of educated and well-to-do Indians also partly explains this element in colonial policy. Thus, in the British House of Commons debate on the Government of India Act of 1935, colonel Wedgewood argued that the backward tracts should remain under British control and should not be controlled by the elected government of the province. Educated Indians, he argued, "want to get them as cheap labour and if these people are to be saved from the hell of civilisation, the only chance they have is British protection and British control and to be free from the insidious advances of the rich people in the provinces to exploit them".[8]

During the colonial period there was not much effective opposition to the exclusionary rules. Yet there were the occasional dissenting views of the modernising and assimilationist nationalist that should serve to remind us of what could have happened to some of these indigenous groups without the protection of the Inner Line. Thus a plains politician argued before the Simon Commission (1927-30) regarding the excluded hill areas:

> Is it fair that 50,000 square miles of territory should be kept as a close preserve for about a million people while six and half millions should be concentrated in 27,000 square miles? We had always looked forward to the material advantages which the vastness of the hill territories and its mineral wealth would afford, in the fullness of time, to the common benefit of the hills and the plains.[9]

Indian nationalist opinion was distrustful of the exclusionary thrust of colonial policy. The nationalists saw it as part of a colonial design of 'divide and rule'. It is to the credit of the post-colonial Indian state that the exclusionary rules have been maintained after independence despite their unpopularity among nationalists. The constituent assembly voted to maintain the excluded and partially excluded status of the tribal areas of north-east India. With respect to the area called the North-East Frontier Agency—Arunachal Pradesh of today—which was a fully excluded area, the Administrative Reforms Commission noted in 1967 that 'some people seem to believe that the Inner Line has only served to insulate the people of NEFA from the mainstream of national life and this, in the long run, will not be beneficial for them'. Yet the commission disagreed with that position noting that 'almost every person, both official and non-official, we met during our visit to NEFA' favoured the continuation of the Inner Line.[10]

Since the formation of distinct states, tribal leaders in power in Arunachal Pradesh, Nagaland, Mizoram and Meghalaya have sought to continue and even strengthen the exclusionary rules. There is sentiment now for extending the Inner Line even to non-tribal areas. For instance, in the early 1980s, the leaders of a popular agitation in Assam protesting illegal immigration into Assam from Bangladesh, demanded the extension of the Inner Line to Assam. A meeting of regional parties of north-eastern states held in 1986 demanded that the Inner Line permits that are required in Nagaland, Mizoram and Arunachal Pradesh be made a requirement in all the states of the north-east. This alone, said a resolution adopted in that meeting, would be able to check the 'large-scale influx of outsiders' that was 'swamping the small nationalities' of the north-east.[11] It is not hard to gauge why exclusionary laws are popular among indigenous groups in the north-east. In Tripura, where the tribals have not had the protection of an Inner Line, their share in the total population declined from 64 per cent in 1874 to 28 per cent in 1981.[12] Migrants—mostly from east Bengal—now constitute 70 per cent of the population and dominate the political process. In June 1980 several hundreds were killed in riots between tribals and Bengali migrants. In Assam, based on the difference between the 1891 Census and the 1971 census, it is estimated that immigrants and their descendants may account for as much as 8.5 million—a majority — of the 1971 population of 15 million. The immigration issue led to serious political turmoil and ethnic violence in Assam between 1979 and 1985.[13]

Political Autonomy through Culturally Defined States

A second element in the Indian minority policy in the north-east is the use of the concept of a culturally defined state as a way of granting political autonomy. The notion that India is made up of distinct linguistic groups was accepted by Indian nationalist leaders as early as 1920, when the Indian National Congress under Gandhi decided to organise the Congress into 21 provincial Congress committees based on local languages. After independence the States Reorganisation Commission (SRC) implicitly extended the linguistic state principle by recommending the redrawing of borders between Indian states based on linguistic considerations. The commission, however, was careful not to legitimise the principle of linguistic states, even while basing its recommendations on that principle. For, while linguistic states could satisfy the demands of a number of ethnic groups in some parts of the country, in areas where no single language was generally accepted as the local language, the notion was potentially very divisive. The notion legitimised the demand for statehood by ethnic groups. While the political movements demanding separate statehood were mostly based on appeal to common language, in the north-east, such movements based their mobilisation mostly on symbols other than language. The demand for a 'hill state', for instance, attempted to mobilise the sentiments of hill people against plainsmen. Even though what eventually emerged as a result of this demand was not a single hill state, but a number of mini states, none of these states are linguistically homogeneous. Most of them, in fact, have English as their official language.

The SRC was quite aware of the difficulty of extending the principle of culturally defined states to the north-east. In fact the SRC's vision for the north-east was a culturally mixed unit that would include all the seven states of the north-east. It recommended the incorporation of NEFA into Assam, which was then administered directly by the central government even though it was constitutionally a part of Assam. The SRC proposed the merger of the union territory of Tripura with Assam. Regarding another union territory, Manipur, the SRC recommended that it continue to remain centrally administered for the moment, but should eventually merge with Assam.[14]

Even though the model of culturally defined states is ill-suited to north-east India, once the principle was accepted, the idea of separate statehood began to shape the political imagination of ethnic groups in the north-east as in other parts of India. In the decades since the

Table 1: A Profile of North-East India, 1981

State	Area Sq Km	Population Millions	Growth Rate	Density Per Sq Km	Per Cent Sch Tribe	Literacy Per Cent
Assam*	87,523	19.90	36.09	254	11	36.00
Nagaland	16,527	07.73	49.73	47	83.99	41.99
Meghalaya	22,487	01.32	31.25	59	80.58	33.22
Manipur	22,356	01.43	33.65	64	27.30	41.99
Tripura	19,477	02.00	32.37	196	28.44	41.58

SRC's recommendations, the government of India has responded to demands by indigenous groups in the north-east by giving them separate states in India's federal system. The initial effort to make these tiny states somewhat less than full-fledged states was given up in the face of the appeal of the model of full statehood and the strength of local opinion favouring it.

The departure from the vision of the SRC started with the formation of Nagaland in 1963 as a result of the government's attempt to deal with the Naga insurgency. The demand for a hill state consisting of the remaining hill areas of Assam—that is present-day Mizoram, Meghalaya and two other hill districts of Assam—had been heard at least since the 1950s. But this demand was resisted until the late 1960s. In December 1969 an 'autonomous state' of Meghalaya comprising the Khasi, Jaintia and Garo hill districts of Assam came into being. The Mikir hill district was given a choice between joining Meghalaya and staying on with the state of Assam. The district council voted not to join Meghalaya. The new autonomous state that shared with the state of Assam, jurisdiction of some policy areas and a common capital, was a short-lived experiment. In 1970 the two union territories of Manipur and Tripura were made into full-fledged states. It was now only a matter of time that Meghalaya's desire to become a full-fledged state would be conceded. The state of Meghalaya was inaugurated on January 1972. In February 1987 the union territories of Mizoram and Arunachal Pradesh became India's 23rd and 24th states respectively.

THE BENEFITS OF STATEHOOD

What benefits do the indigenous minorities of the north-east get from statehood? The formation of these mini states has allowed elected representatives of indigenous peoples to gain power at the state level and to determine policy in areas that are under the constitutional jurisdiction of states. The significance of this can hardly be exaggerated.

The control of state legislatures by representatives of indigenous peoples, for instance, has meant that on substantive issues like the Inner Line policy, the preference of indigenous peoples are reflected in the law of the land. Writing on the Apa Tanis of Arunachal Pradesh, the anthropologist Furer-Haimendorf notes:

> Apa Tanis of the present generation, both traditionalist and modern, fully support this [the 'Inner Line] policy, and there are no indications that they would welcome the lifting of the protective barrier which interferes in no way with the movements of Apa Tanis and other tribesmen but keeps out potential exploiters. It is difficult to imagine that in the foreseeable future the legislative assembly of Arunachal Pradesh, composed overwhelmingly by tribal representatives, would agree to open the territory to uncontrolled influx of population from the plains. It may thus be safe in predicting that for a long time to come the Apa Tani Valley will remain a heaven for a self-contained society unsurpassed in its skill to utilise the natural resources of its environment and to invest life with a *joie de vivre* such as few Indian societies can rival.[15]

However, once democratically elected leaders of indigenous peoples control power in their states, it is not easy to say what cultural policies they would adopt. Cultural survival is not an unproblematical concept. It has to incorporate a dynamic notion of culture: it may include the preservation of some old traditions, abandonment of others and invention of new ones. But what is important is that the people themselves have a say in making these decisions. What to outsiders may appear to be an aspect of a culture that deserves preservation may or may not appear as such to the people involved. Various influences, for instance, prevailing ideas about modernity, seem to determine what these societies feel should be preserved and what should be given up. The experience of what indigenous peoples have done with political power in the north-eastern states brings home this point. Let me give an example of cultural policies advocated by an organisation of indigenous peoples that have emerged as part of the democratic process in Arunachal Pradesh. The Apa Tani Youth Organisation, established in 1974, has adopted a number of resolutions—drafted in English—regarding ways to preserve their cultures and traditions. In one of these resolutions the association resolved to 'conduct cultural tourings and a social service camp' in the Apa Tani area. Among the objects of these tours are: (1) to abolish the puncturing of the nose and the tattooing of the face, (2) to discourage the use of (cane) tails, (3) to discourage the wearing of unnecessary necklaces, (4) to modify the hair-dress of the young generation, (5) to encourage inter-caste marriage, (6) to abolish child marriage, (7) to encourage the use of traditional dress by both boys and girls. [This refers to hand-woven clothes worn as cloaks— CFH] (8) to encourage cultural and fashion shows annually, (9) to encourage the community dance, (10) the improve the use of the Apa Tani dialect, (11) to encourage the use of the Roman alphabet as Apa Tani script.[16]

The old and new traditions that have become part of the official cultural symbolism of the mini-states of north-east India would sometimes surprise outside observers. In 1988 I was struck by a sign, 'Jesus Lives' in newspaper pictures of an official ceremony held in Dimapur to inaugurate the first airport in Nagaland. The sign reflects the influence of Christianity among the Nagas—that was brought to the Nagas by American baptists—and the fact that many of the Nagaland's elected officials are practising baptists.

In assessing the practical effects of India's minority policy in the north-east, I have focused so far on cultural issues. There are important social, economic and political consequences of this policy. In Nagaland, Arunachal Pradesh, Mizoram and Meghalaya, legislatures dominated by representatives of indigenous peoples have extended and strengthened policies of protective discrimination in favour of scheduled tribes in government employment and the allocation of government contracts. Transfer of land and property to non-tribal hands have been made extremely difficult, if not impossible. Development funds have been pumped into these areas in recent years. The developmental impact of these policies need to be evaluated. Corruption in some of these states is believed to be quite extensive. Whatever one thinks of corruption, it seems likely that by providing linkage between elites and non-elites, corruption has made the local political process more responsive to indigenous minorities and in doing so, it has aided the process of incorporation of these groups into the Indian mainstream.

THE LIMITS OF THE POLICY FRAMFWORK

Both the colonial policy of preservation of the cultures of indigenous peoples through drawing restrictive boundaries and the post-colonial policy of culturally defined states assume a model of cultural survival that is problematical. The assumption that there are exclusive territorially based ethnic groups that can be given autonomy in their territories is problematical in the context of north-east India. To impose such a model there is to court danger, despite its effectiveness so far.

Even the smallest of the mini states of north-east India is anything but culturally or linguistically homogeneous. Yet the cultural policies of some of these states have attempted to give the stamp of a particular identity to these states. Assam and Mizoram are examples of this trend. States such as Meghalaya and Arunachal Pradesh have been more pluralistic in terms of official symbolism. This aspect of India's minority policy might some day prove to be a pandora's box. There have been signs of significant tensions between ethnic groups within these mini states. In Mizoram, for instance, there is tension between the Mizos and the Buddhist Chakmas. One issue that divided the government of India and Laldenga for some time was his insistence that the Chakma autonomous district council that gives a certain amount of autonomy to Chakmas be abolished.[17] In the past some Hmars of Mizoram too have asserted their distinctiveness from the Mizos. The Pawis have had a party called the Chin National Front. As a Pawi leader, arguing in favour of equal status of Pawis, Lakers and Chakmas with the Mizos, said in 1972: 'When the Mizos had a district council, we also had a district council. Since Mizoram has become a union territory, we also should have the same status which the Mizos have.'[18]

Such tensions have been a major part of the post-independence history of the state of Assam. Under the influence of the ideology of the linguistic states, Assam's political leadership in the 1950s and 1960s pursued cultural policies—e g, its policy on the state's official language and on the language of educational institutions—that sought to define the state as Assamese. Superimposed on Assam's cultural diversity, these policies were a significant factor in the alienation of some of the indigenous minorities from the Assamese. The current Bodo demand for further division of the state of Assam to form a new state of Bodoland is the latest example of the divisive consequences of such cultural policies. The demands for Greater Mizoram or Greater Nagaland, that have become politically salient from time to time, are potentially highly emotive and conflictual issues. The vision of a Greater Mizoram, for instance, involves the reclaiming of territories that are allegedly part of the Mizo cultural or historical region and are now in Assam, Manipur and Tripura as well as in Burma and Bangladesh. There have been instances of armed conflict between the states of north-east India over territorial disputes—not unlike border conflicts between sovereign states.

In recent years there have been a number of instances of armed Nagas attacking Assamese villagers living in disputed territories. These episodes may anticipate a dangerous future that might some day bring to the fore the negative consequences of the attempt to re-organise the north-east into culturally defined discrete states.

Furthermore, the legacy of exclusionary policies are unlikely to be of much use in those areas that did not historically benefit from such policies and have absorbed the bulk of immigration into the area. In these areas, e g, Assam and Tripura, this legacy has encouraged nativist movements to demand exclusionary rules. Yet at this point cultural survival in these areas would depend partly on the ability to develop inclusive and pluralistic cultures and not on harking back to an era of protection through exclusionary rules.

CONCLUSION

The goal of this essay has been to focus attention on aspects of India's minority policy in the north-east that have eluded most observers. It is not my intention to under-emphasise the record of human rights violations in the north-east as a result of the Indian government's military response to the Naga and Mizo insurgencies and the recurrent violent conflicts between locals and immigrants in most of these states. But that story is relatively well known. The other side of the Indian minority policy in the north-east has not been generally recognised.

Partly due to the recurrent political unrest, the Indian government has been reluctant to allow foreigners to visit the north-east. Yet as the anthropologist Furer-Haimendor of, who had done pioneering work in the 1940s in parts of what is now Arunachal Pradesh, noted on his return to the area in 1978:

> The developments in Arunachal Pradesh are undoubtedly one of the success stories of present-day India, and one wonders why the astounding progress of the tribesmen of this region is being covered with a veil of secrecy while the far less creditable situation in the tribal areas of peninsular India can be observed without any need for official permission.[19]

The fact that the Indian government's largely successful policy in the north-east has to some extent been the result of *ad hoc* and incrementalist decision-making rather than self-conscious and systematic thinking, perhaps explains this paradox. That their policy in the north-east has had some significant positive results may come as a surprise to Indian policy-makers. Whatever the motivation or style of policy-making, there is little doubt that the Indian policy compares quite favourably with how indigenous minorities of the same geographical region have been treated by the state in Bangladesh, in Burma and somewhat further away, across the Himalayas, in Tibet. The policy, as I have emphasised, has its dangers too. In order to avert these dangers, future policy would perhaps have to be somewhat more self-conscious and reflective. The impressive structure of democratic representation of indigenous peoples and the incorporation of most disaffected groups into the Indian political process provide a good beginning for developing such a policy. The foundation today

in the rest of the country and representatives of indigenous peoples towards formulating future minority policy in the north-east more self-consciously than in the past.

DISCUSSION

Poverty Measures and Tax Devolution

Hemlata Rao

G THIMMAIAH in his discussion (June 10) on Amaresh Bagchi and Uma Dutta Roy Choudhury's paper (April 15) has advocated the use of a composite index of development instead of a 'poverty-ratio' as a criterion in the scheme of fiscal devolution.

Regarding the use of the 'poverty' criterion, or for that matter any criterion, there are two issues which need to be examined. First, whether there is any theoretical justification for adopting a particular criterion; and, second, whether a proper and convincing measure of the criterion is available. If such a measure is not readily available and if the criterion is theoretically sound, then it is desirable to develop/modify or refine the measure of the selected criterion.

Regarding the 'poverty-ratio' as a criterion, Thimmaiah puts forth two contradictory arguments. First, he discards the use of poverty ratio on two grounds

(i) per capita SDP and poverty ratio are to some extent positively associated and therefore better-off states (judged in terms of per capita SDP) which can finance their expenditure needs to a large extent from their own revenues tend to receive more tax devolution; and
(ii) the poverty-ratio as it is presently estimated involves many deficiencies.

At another place he expresses a different view. His contention here is that "it is possible to use the poverty-ratio as an indicator of taxable capacity of the masses. Since the state governments have the power to raise funds mostly through indirect taxes and since indirect taxes are paid by the vast majority of the masses, and if a majority of them are below the poverty line in some states, then their capacity to pay indirect taxes to the state governments would be lower". If this is the case, then how is it that he finds a positive association of per capita SDP and poverty-ratio?

Justification of the poverty-ratio as a criterion in the scheme of devolution needs to be strengthened not only from the point of judging a state's fiscal potential but also from the viewpoint of its responsibilities or 'expenditure need'. In fact, a higher poverty-ridden population, puts a heavy demand on government-provided goods and services such as free education, health facilities, subsidised transport and so on. Besides these, the government has to spend substantial amounts on various welfare measures in order to alleviate poverty. Thus the need for resources increases with an increase in poverty. Viewed from the point of both 'fiscal capacity' and fiscal need, 'poverty-ratio' can be theoretically justified as an appropriate criterion to be adopted in the scheme of devolution.

However, a major problem in the adoption of the poverty-ratio criterion lies with its proper definition and precise measurement. Thimmaiah is right when he says that as the existing measures are deficient, the ratio should not be used as a supplementary criterion for effecting tax devolution. Perhaps it is due to the deficiency in the measure that Thimmaiah finds a positive association between per capita SDP and poverty-ratio.

Thimmaiah advocates the uses of a composite index of development instead of the poverty-ratio in the scheme of devolution. But the alternative suggested by him also suffers from the same shortcomings as the poverty-ratio. Theoretically, there is every justification for adopting a composite index of development. I have brought out the importance of this 'criterion' in my earlier studies.[1] However, the major problem one encounters in this regard pertains to (i) proper selection of development indicators, (ii) correct data pertaining to the selected indicators, and (iii) assigning proper weights and pooling the indicators together. It is not difficult to do so. However, in their over-enthusiasm, many people neglect the crucial steps involved in the construction of a composite index and often select a mix of variables. Sometimes even structural variables are mistaken for development indicators. Many times input-output variables, stock and flow variables are pooled together by scholars. It is also quite common to see people using any variable on which data are available while constructing a composite index. Further, over-representation or under-representation of some sectors is a common error which most people commit.

The composite index presented by Thimmaiah also suffers from deficiencies pertaining to its measurement. He himself admits it when he says, "under the composite index, only Bihar loses its share and Gujarat, Punjab and Haryana gain. This can be prevented by selecting more appropriate indicators of backwardness. . .". Thimmaiah argues against the use of the poverty-ratio mainly because he feels that at present the estimates are deficient. I see the same shortcoming in his composite measure of the level of development.

Thimmaiah in his zeal has tried to produce a hybrid criterion by mixing up a 'composite index of development' as developed by me[2] and the criterion of distance from the highest per capita income state multiplied by 1971 population as adopted by the Eighth and Ninth Finance Commissions. The result is that the estimated devolution as per Thimmaiah's recommendation bears no relationship with his own composite index. The rank coefficient of correlation between the composite index of infrastructure development and his estimated devolution (see *EPW*, June 10, Table on p 1303) is just 0.27388 which is not significant even at 5 per cent level. Further, while better off states like Gujarat, Haryana, Punjab and so on gain in his scheme of devolution, backward states like Mizoram, Nagaland, Sikkim, UP and so on, lose

My contention is that the composite index of development should be used in the scheme of devolution with great caution. One should not construct an index in haste and without properly understanding the steps involved in the construction process. As the index used by Thimmaiah also suffers from many deficiencies pertaining to the measures of devlopment, the alternative suggested by him is in no way better than the poverty-ratio criterion.

NOTICE

It is hereby notified for the information of the public that **Vam Organic Chemicals Limited** propose to make an application to the Central Government in the Department of Company Affairs, New Delhi, under Sub Section (2) of Section 22 of the Monopolies and Restrictive Trade Practices Act, 1969, for approval to the establishment of new undertaking/unit/division. Brief particulars of the proposal are as under:

1. Name and address of the Applicant : **Vam Organic Chemicals Limited**
   Bhartiagram
   Gajraula
   District Moradabad
   UTTAR PRADESH

2. Capital Structure of the applicant organization :

	Equity	Preference
	(Rs. in Lakh)	
a) Authorised	1460.00	40.00
b) Issued and Subscribed	516.42	38.50
c) Paid up	516.23	38.50

3. Management structure of the applicant organization indicating the names of directors, including managing director/wholetime director and manager, if any. : The company is managed by the Board of Directors consisting of

Shri M L Bhartia	—	Chairman
Shri S S Bhartia	—	Managing Director
Shri H S Bhartia	—	Wholetime Director
Shri P K Khaitan	—	Director
Shri J B Dadachanji	—	Director
Shri L Ivnas (Alternate Shri M T Shah)	—	Director
Shri H J K Klouman (Alternate Shri A T Shah)	—	Director
Shri S S Kanoria	—	Director
Shri A Ray	—	Director
Shri R K Bhargava	—	Nominee Director (PICUP)
Smt. Sunanda Prasad	—	Nominee Director (UPSIDC)
Shri Lalit Srivastava	—	Nominee Director (UPSIDC)

4. Indicate whether the proposal relates to the establishment of new undertaking or a new unit/division : New undertaking
5. Location of the new undertaking/unit/division : Duliajan, Distt. Dibrugarh, Assam
6. Capital structure of the proposed undertaking as mentioned in Sr. No. 2 : To be decided later in consultation with financial institutions/merchant bankers.
7. In case the proposal relates to the production, storage, supply, distribution, marketing or control of any goods/articles, indicate: :
   i) Name of the goods/articles and proposed licensed capacity :

Product	Capacity (MTA)
Ethylene	300,000
Linear Low Density Polyethylene/High Density Polyethylene	200,000
Mono Ethylene Glycol	60,000
Di Ethylene Glycol	6,300
Tri Ethylene Glycol	400
Ethylene Oxide	5,000
Alpha Olefins	45,000
Butadiene	22,000
Natural Gas Liquid	65,500
Pyrolysis Gasoline	20,000
Carbon Black Feedstock	5,000
Acetylene	2,500
Propylene	63,000

   ii) Estimated annual turnover : Rs. 838 crores
8. In case the proposal relates to the provision of any service, state the volume of activity in terms of annual measures such as value, income, turnover, etc. : Not Applicable
9. Cost of project : Rs. 1541 crores
10. Scheme of Finance, indicating the amounts to be raised from each source :
    Equity : Rs. 310 crores
    Foreign Exchange loans : Rs. 315 crores
    Rupee loans/Debentures : Rs. 916 crores

Any person interested in the matter may make a representation in quadruplicate to the Secretary, Department of Company Affairs Government of India, Shastri Bhavan, New Delhi, within 14 days of publication of this notice, intimating his views on the proposal and indicating the nature of his interest therein.

FOR **VAM ORGANIC CHEMICALS LIMITED**

Dated: This 9 th day of September, 1989

How Parasitical

The rapid growth of the tertiary sector in the Indian economy has understandably raised questions about the significance of this phenomenon. Some economists have argued that the net domestic product becomes a misleading indicator of economic progress of a poor country if the tertiary sector grows rapidly. How tenable is this view in the light of the Indian experience? 2149

Politics of Centre-State Relations

During the last four decades the Indian state has addressed the task of coping with the tensions arising in different regions of the country by resorting to a variety of means, depending on the particular facet—economic, political, constitutional, cultural/linguistic—involved in each specific conflict. What are the shifts that have occurred in the major thrust of centre-state conflicts and contradictions during this period? 2133

Feminism and the Left

The left cannot provide a correct analysis of feminism unless it begins to comprehend patriarchy in its historical setting and its complex and problematic relationship with the dominant relations of production. 2123

Exchange Drain

An attempt to build a time series for the foreign exchange earnings and expenditures of the private corporate sector in India from 1960-61. What light do the data throw on the cost-benefit of import of capital and technology? 2155

Answer to Prolonged Closure?

The workers have initiated a takeover plan in an industrial unit in a bid to counter managerial manipulation. The case of Hoist-O-Mech at Thane. 2113

Debt Unmasked

What was once considered a well guarded secret by the government is now getting unmasked in the face of evidence from diverse sources. The government's estimate of India's external debt set against those of the World Bank and the OECD. 2111

Encouraging Impunity

While US-Soviet agreements may end the cold war, they seem to encourage Washington to pursue hot wars through surrogates in the third world. 2121

CSIR Endangered

It is now over two years since the Abid Hussain Committee submitted its report on the reorganisation of the CSIR and it is possible now to form a perspective viewpoint of the report. There are reasons to fear that the committee's recommendations, together with those of the Fourth Pay Commission, could spell the dismantling of the CSIR within a decade. 2115

Non-Capital View

Much of the discussion and speculation on the general election to the next Lok Sabha has been Delhi-centred. There is little indication of what is going on in the minds of the millions of voters interspersed through some 1.2 million square miles of territory. 2103

Changing Perspective

UNCTAD has lately been taking up issues from the mainstream perspective while still siding with the less fortunate economies. 2109

LETTERS TO EDITOR

Socialist Freedom and Repression

I SHALL be obliged if you publish the following few lines as a response to K Balagopal's 'What Is Socialist Freedom?' (August 5).

Balagopal would like to make a very clear distinction between 'bourgeois' democracy (or freedom) and 'socialist' democracy. And he would not agree with the view that the essential differences between the two lies in the fact that while bourgeois freedom means the basic human freedom formally (though usually only partly) recognised but actually severely circumscribed by the highly iniquitous bourgeois socio-economic conditions of life and thereby largely unrealised for the vast masses of people, socialist freedom means the unfettering of these rights by doing away with the shackles of socio-economic oppression and inequalities and making these rights actually realised for the vast masses of toilers. Balagopal would rather define socialist freedom as the freedom to build socialism. He further informs us that 'socialist freedom', the freedom to build 'socialism', is inseparable from the idea of the perpetual existence of a strong, central and repressive state authority to guarantee the safety and well-being of 'socialism' which is under perpetual threat of counter-revolutionary onslaughts as "there is a class enemy inside each one of us", irrespective of caste, creed, religion and *class*. So a 'socialist' state cannot be anything but violently repressive, as it has to constantly engage itself in the massive exercise of exorcising the 'evil spirits' (the counter-revolutionaries within), which keep on finding ways of sneaking back into our souls, just not a handful, but in each one of us. Consequently, empathy between the 'socialist' state and the revolutionary masses could be obtained only as a rare exception and by no means as a general rule.

Even the most ardent votary of the capitalist 'free world' could hardly have painted a more monstrous picture of the socialist objective.

Balagopal is here only echoing what all the conservative and reactionary religions have exhorted through the ages—that a human is an eternal sinner and only an external authority standing above his/her head with a big stick in hand (deriving legitimacy from some undefinable divine sanction) can make him/her keep to the right path.

Balagopal's Marxism, characterised by its strident advocacy of perpetual subjugation of human individual, flowing from its deep cynical mistrust of human nature, stands poles apart from classical Marxism, the central concern of which, as of numerous other progressive and revolutionary currents which preceded it, is the complete unbinding, the total liberation of the human Prometheus from all physical and spiritual shackles by doing away with all forms of external authorities. Marxism, as propounded by Marx, Engels, Lenin (and also Trotsky and Rosa Luxemburg) is very much the co-sharer of the anarchist dream that humanity will one day eventually usher in the millennium, where there will neither be any lord over the head nor any slaves under the feet, where there will be no ruler and no ruled and where "free development of each will lead to the free development of all".

In view of Balagopal's arrogant assertion that "it is slightly irritating to hear otherwise intelligent people say that a repressive state apparatus may be required for a few years after the revolution, until all enemies are vanquished, but what is its need after so many decades. If the enemies consisted only of a handful of imperialist agents and big landlords then no repressive state apparatus would be required even for a few years. But there is a class enemy inside each one of us, and the real problem is how to drive that person out without doing too much damage to ourselves", it would be quite worthwhile to have a careful second look at the 'classical' Marxist position in this regard. Lenin, in his celebrated *The State and Revolution* says, "in capitalist society we have a democracy that is curtailed, wretched, false, a democracy only for the rich, for the minority. The dictatorship of the proletariat, the period of transition to communism, will for the first time create democracy for the people, for the majority, alongwith the necessary suppression of the exploiters, of the minority. Communism alone is capable of providing really complete democracy, and the more complete it is, the sooner it will become unnecessary and wither away of its own accord." Lenin proceeds to further elaborate:

> In other words, under capitalism we have the state in the proper sense of the word, that is a special machine for the suppression of one class by another and, what is more, of the majority by the minority. Naturally, to be successful, such an undertaking as the systematic suppression of the exploited majority by the exploiting minority calls for the utmost ferocity and savagery in the matter of suppression, it calls for seas of blood, through which mankind is actually wading its way in slavery, serfdom and wage labour.
>
> Furthermore, during the *transition* from capitalism to communism suppression is still necessary, but it is now the suppression of the exploiting minority by the exploited majority. A special apparatus, a special machine for suppression, the 'state' is *still* necessary, but this is now a transitional state. It is no longer a state in the proper sense of the word; for the suppression of the minority of exploiters by the majority of wage slaves of *yesterday* is comparatively so easy, simple and natural a task that it will entail far less bloodshed than the suppression of the rising of the slaves, serfs or wage labourers and it will cost mankind far less. And it is compatible with extension of democracy to such an overwhelming majority of the population that the need for a special machine of suppression (the 'state') will begin to disappear.

Obviously the gulf between Balagopal's Marxism and 'classical' Marxism could have not been any wider. And it is perhaps the cruellest joke that yet viewpoints such as Balagopal's go by the name of Marxism. That this brand of 'Marxism', bereft of the essential libertarian (and rationalist) spirit, has come to be identified, for a number of historical reasons, as mainstream. Marxism is probably the greatest tragedy of the present century.

SUKLA SEN

Bombay

Mere Speculation

IT is best to let alone DN's diatribe (August 19, 1989, pp 1921-23) against 'mainstream Marxists', whoever they might be. There is however no question of *my* getting any facts wrong: I was only speculating on the extent of vandalism with facts iconoclasts of the 'socially necessary' school are capable of.

Twin Terror in Punjab

THE murder of the 15-year old son of the notorious former Batala SSP, Gobind Ram (who was transferred recently following charges of torture of women) allegedly by Khalistani terrorists, shows up the miserable link that binds together minds of cowardly violence in Punjab today. Gobind Ram, the police boss, unable to apprehend wanted 'terrorists' (the term 'terrorist' itself, applied by the police to harass and kill innocent people in false encounters, has lost its original meaning in the Punjab context), arrested their wives and took it out on them. In retaliation (if at all it can be called a retaliation!), the Khalistanis, unable to get at Gobind Ram, chose a soft target—his son!

In the combat between the two, the state and the Khalistanis, the real combatants rarely meet each other face to face. They conveniently select their victims to demonstrate their might. The security forces have to meet the target set by their bosses, governor S S Ray and the police chief K P S Gill, who want to impress the rest of India that they are finishing off the terrorists. But scared of confronting the AK-47 toting terrorists, the police choose instead to nab indiscriminately innocent villagers, parade them as 'terrorists' and, when necessary, kill them and display their bodies as those of "dreaded terrorists" killed in encounters! On several occasions, human rights organisations investigating into such killings in Punjab have come out with evidence which has shown that the victims had nothing to do with Khalistani terrorism.

The cowardice and remorseless cruelty of the state's security forces are matched by the poltroonery and depravity of the various Khalistani terrorist groups. The majority of their victims so far have been members of the public—bus passengers, innocent citizens in crowded thoroughfares, villagers who had refused to knuckle under to their extortions, and Leftist activists ranging from the CPI to the Marxist-Leninist groups who had been consistently fighting both state terrorism and the obscurantism of the Khalistanis. The list of these victims is lengthening day by day compared to that of those who are supposed to be the real enemies of the Khalistanis—the police officials, the security forces, the members of the various counter-insurgency outfits who are on the rampage in the Punjab villages.

It appears that both state terrorism and Khalistani terrorism are complementing each other in an ominous process of terrorising the people of Punjab and reducing them to a state of abject servility to local gangsters. Often, the two blend into each other, their modes of operation being frighteningly similar, giving rise to the suspicion that there is a common source behind both. Speculation that some of the so-called terrorist groups may enjoy the patronage of the union home ministry that had gained currency sometime ago is now indirectly confirmed by the latest embarrassing disclosures about the activities of an outfit called the 'Cats', an underground hit squad of the Punjab police. Formed ostensibly to counter the terrorists, members of the 'Cats' are usually recruited from the ranks of the Khalistani terrorists who had surrendered to the police. They romp around pretending to be Khalistanis, armed with the usual AK-47 rifles and other sophisticated weapons. On the night of September 10, one such 'Cats' group attempted to loot a family in Kaler Khurd village in Batala in Punjab, and its leader 'Kala' got killed accidentally by his own men who panicked and started firing indiscriminately. A search of Kala's body revealed his identity card which proved that he was on the payroll of the police.

The operative tactics by both the police and the Khalistani terrorists are increasingly resembling each other. The victims—both Sikhs and Hindus—are exposed to extortions. While the police demand money from farmers in exchange of promises to protect them against trumped-up charges of 'terrorism', the Khalistani terrorist groups demand food and shelter from them at the point of the gun. While the police pick up innocent villagers and kill them to meet the target of 'catches' which they are required to fulfil, the Khalistani terrorists go in for bomb blasts or mass killings to make their presence felt. The targets are common—the citizens who are not involved in this senseless combat in what looks more and more like deadly shadow-boxing between two combatants who appear to be temporary enemies today, but are essentially allies in their common long-term goal of subjecting the people to an authoritarian system.

NRI INVESTMENT

Making a Little Go a Long Way

THE figures given out by the government of India on NRI investments are rather intriguing. They also raise some questions.

Of the total number of 974 NRI investment proposals received in the five-year period 1984-89, as many as 806 (i e, roughly 84 per cent) were cleared by government. But so far only 103 projects (12.5 per cent) have been set up and another 351 projects (44 per cent) are described as being "under implementation" (whatever that term can be understood to mean). A small number, 29 to be exact, have been abandoned. But what about the rest? Could it be that as high a proportion as 40 per cent of the officially cleared NRI projects have not reached even the drawing-board stage?

As regards the investment involved in the NRI proposals, the official figures provided are for all the 974 proposals put up for clearance and not for the 807 proposals cleared by the government. The total project cost of the 974 proposals is given out as Rs 2,450 crore. Of this the loan component is Rs 1,530 crore and some Rs 520 crore is to come from resident Indian investors. A small sum of Rs 12 crore has been mentioned as 'foreign investment', meaning perhaps non-NRI foreign investment which will be repatriable. The balance of Rs 388 crore presumably represents the NRIs' own investment in these projects which is non-repatriable. It is noteworthy that in projects involving a total investment cost of Rs 2,450 crore, the proposed NRI investment is only of this order, or less than 16 per cent. Ignoring the minuscule fraction accounted for by what the official figures describe as 'foreign investment', what this means is that well over four-fifths of the cost of NRI projects, 83.5 per cent to be precise, are to be internally generated in India, partly through resident investment but largely through borrowing.

The ardent votaries of direct foreign investment, not just the proselytisers from the World Bank and IMF but also members of our own Planning Commission, when they advocate further liberalisation of entry rules for foreign investment in India ought to make their position clear on what exactly they thereby seek to secure for the country. The figures given out with regard to NRI investment proposals show clearly that at least this group of foreign investors are interested not in any substantial export of capital to India. On the contrary, their purpose seems to be to build up business empires on the strength of funds to be mobilised within India several times larger than their own investment. So what is being advocated evidently is that there should be still further dilution of the requirements so that NRIs will be required to bring in themselves an even smaller proportion of the total cost of their projects here.

LENTIN REPORT

Public Apathy

SOME two years ago the Maharashtra government-appointed Lentin Commission submitted what must surely be the most thorough-going report on the public health system in the country. Constituted to look into the death of 14 persons at the J J Hospital in Bombay, justice Lentin insisted on following up every lead and found a most tangled web which involved top officials of the Food and Drugs Administration (FDA) and ministers of the Maharashtra government. His recommendations, had they been implemented, would have included a drastic revamping of the management and organisation of the public hospital system as well as of the FDA in Maharashtra. It is not surprising that the state government has, however, done precious little to implement the commission's recommendations, for doing so would have meant demolishing the entire structure of favours received and favours granted by which the FDA and the public health system functions.

The fact that the state's drugs control authority is responsible for assuring the safety and suitability of the medicines manufactured by 80 per cent of the industry in the country which is located in Maharashtra makes this negligence on the part of the state government of grave significance. The Lentin report has been bandied about in the state assembly and much has been made of the manner in which Lentin chose to conduct the inquiry, paying little heed to the governmental status of the guilty parties. Nor in fact did he succumb to the numerous threats he received and he held fast to his decision that the inquiry proceedings should be open to the public and that the press had every right to report them in detail. Because of this it was not possible for the government to conceal or suppress any part of the report had it wished to do so. The indictment is there for all to read. But the government has dragged its feet in implementing the report.

While the Maharashtra government's inaction is certainly condemnable, the lack of public pressure on the issue is also noteworthy. The discussions in the state assembly on the Lentin report have largely been confined to the rights and privileges of ministers indicted by the commission. There has been no concerted pressure on the government to implement the recommendations. Nor unfortunately have any of the professional associations of doctors deemed it necessary to either commend the report or urge the government to undertake the recommended changes. The drug consumer groups did make some attempts to mobilise public opinion, but these were by and large desultory. And this—the lack of activity on the part of the public to use the excellent report to force the government to revamp the decaying structure of public health—is of far greater concern than the government's own inaction. For the latter was to be expected.

In this atmosphere of public apathy the setting up of inquiry commissions such as the Lentin one to go into questions of major public import will continue to be meaningless exercises. They would only serve to provide a measure of credibility to corrupt and/or incompetent governments which can then lay claim to democratic functioning while at the same time, where possible, trying to tailor the reports to their requirements. It is after all rarely that a justice Lentin happens to head a government-appointed commission of inquiry.

WEST BENGAL

What Is Being Celebrated?

A CERTAIN light-heartedness in decision-making, preference for easy options of cheap stunts, inane glorification of feudal lifestyles and so on seem to have been marking the West Bengal Left Front government's programme for the tercentenary celebration of Job Charnock's foundation of the settlement on the bank of the Hooghly which later developed into the metropolis of Calcutta. Naturally and pertinently, questions have been raised not only about the specifics of the celebration programme but also the very decision of holding the celebration itself.

Firstly, students of history argue that Calcutta was not *founded* by Charnock at all, its history goes back to a much earlier period. Secondly, as some others argue, the beginning of a foreign settlement as a bridgehead of imperialist penetration and aggression cannot and should not be an occasion for celebration by the victims of the historical aggression. These critics also point out that the beginning of the British settlements in Madras and Bombay, which predates Calcutta's, had been justifiably ignored by those cities.

Even supposing, as West Bengal culture and information minister Budhdhadev Bhattacharya holds, that it would be 'anti-historical' to deny the British connection with Calcutta, is it really necessary and proper for the West Bengal Left Front government to associate with a snobbish set and to mobilise the consular corps to pay homage at Job Charnock's grave?

The historical fact of the British linkage with the city of Calcutta has to be grasped in its dialectical connotation. As E J Hobsbawm, echoing Marx, has noted: "For the peoples of the world outside capitalism, who were now grasped and shaken by it, it meant the choice between a doomed resistance in terms of their ancient traditions and ways, and a traumatic process of seizing the weapons of the west and turning them against the conquerors: of understanding and manipulating 'progress' themse'.es..."

The victims or imperialist aggression have

no reason at all for celebrating the advances of their conquerors; they should remember with pride only the occasions of and attempts at their seizing the weapons of the west and turning them against the conquerors. From this point of view, the staging of the pageant of horse-drawn tramcars with the foppishly dressed 19th-century 'baboos and bibis', which was personally inaugurated by the left front chief minister Jyoti Basu, is a distasteful incongruity.

PUBLIC ENTERPRISES

The Dark Area

S L Rao writes:

THE Annual Report (1987-88) of the Bureau of Public Enterprises, government of India, has been much discussed and written about. The report is primarily an analysis of the finances of these enterprises and discussions have tended to focus on relative rankings and such other matters based on the financial information contained in the report.

There is no information anywhere in the report which allows an evaluation of the marketing performance of the public enterprises. We do not know how the marketing function is organised whether in enterprises like Hindustan Latex, NTC, LIC, UTI, Modern Bread, etc, which could be designated as consumer product companies, nor for any of the other industrial and heavy engineering enterprises. We do not know if and how many salesmen are employed, what are the selected channels for distribution, whether agents are used and for what purpose, and in what manner, nor what margins are made available to them. There is no data on advertising expenditure, the purpose of the expenditure, the details of the expenditure by media, examples of the advertising, the advertising agencies used, and the results.

There is a chapter on Pricing Policy but it has no relation to a marketing (or customer) orientation. It says that "prices... should be so determined that at a satisfactory level of capacity utilisation these enterprises not only cover their costs of production, but also generate a reasonable amount of surplus". This may be feasible in monopoly or near-monopoly situations. Many public enterprises are in increasingly competitive market situations and pricing has to be a marketing tool which is integrated with product policy and product design, as well as with overall market strategies in relation to the consumer and competition. Decisions on matters like distribution, sales force, advertising and promotion, cannot be taken in isolation but along with decisions on pricing, and must form part of an overall marketing strategy. The report does not give us any idea as to whether there is such a marketing strategy for each public enterprise, and how various decisions arise from it.

We have no measures of marketing productivity in each enterprise so that we can evaluate the efficiency of its distribution, sales force, advertising, and other marketing tools. There is no indication that any of these enterprises makes an attempt to systematically gather data about its present and prospective customers, as well as of competition, so as to adapt the business to the customer and the nature of the competition.

Most enterprises have some heterogeneity among their customers. They vary, by the use they make of the product or service, by their prosperity, their quality needs, etc. Marketing management endeavours to match products to segments and to use other marketing tools like advertising to position their product for purchase by these segments. Public enterprises must have similar experiences. It is not known whether they plan in advance or segment their markets on an ad hoc basis.

Public enterprises need to pay a great deal more attention to marketing and must move away from associating marketing only with advertising or selling. They must see it as a way to orient their whole enterprise to the customer's needs. The Annual Report of the BPE could take a long step in this direction by presenting a critique of the marketing performance of the public enterprises.

SOVIET UNION

Unresolved Nationality Question

THE nationalities question has reared its head once again in the Soviet Union. On August 23, the 50th anniversary of the signing of the Molotov-Ribbentrop pact, hundreds of thousands of people of the Baltic republics formed a human chain from Tallin, the capital of Estonia, via Riga, the capital of Latvia, to Vilnius, the capital of Lithuania, to express their desire for 'sovereignty' or 'independence' from Moscow. The Molotov-Ribbentrop pact is viewed by these people as having led to the carving up of eastern Europe between the Soviet Union and Nazi Germany and thereby leading to the annexation of the three Baltic republics by the Soviet Union under Stalin. In July the ideology secretary of the Estonian Communist Party, Mikk Tittma, openly denounced the imposition of Soviet rule since 1940 saying that "50 years of Soviet power have not given any victories to Estonians. On the contrary the nation has been suppressed. The desire of the absolute majority of Estonians to leave the Soviet Union is absolutely normal". The national movements in the Baltics are growing and, at least in Estonia and Lithuania, they are supported by the local communist parties.

The resolutions passed at the 19th All-Union Party Conference in June last year called for more devolution of economic and political power to the republics and measures to ensure their national-cultural development. In line with this and as part of the decentralisation process, a draft law has been drawn up for economic autonomy in Estonia and Lithuania. Besides making provision for independent budgets the right to level their own taxation and set local prices, there is also a clause setting out the degree of control over natural resources. But there are deep divisions in Moscow itself over this draft law which were recently reflected in a debate in the Supreme Soviet between its votary, Leonid Abalkin, deputy premier and chairman of the State Committee on Economic Reform, and Yuri Maslyukov, chairman of Gosplan, first deputy premier and member of the politburo.

The question of autonomy in the political sphere too has come up, this time in the presidium of the Supreme Soviet when it was found that a recent Estonian electoral law was at odds with the Soviet constitution. It issued a decree requiring the Estonian government to amend the law before October 1. Though the 'right to secede' is laid down in Article 72 of the Soviet constitution this article has always conflicted with other provisions, which effectively give the Union a veto over unilateral decisions of any republic.

The Baltic states are not the only republics where the nationality question has come to the fore. In Armenia there is a movement with a demand for transferring the autonomous region of Nagarno-Karabakh, which has been placed under the direct control of Moscow, from Azerbaijan to Armenia. On April 9, 20 nationalist demonstrators died in the Georgian capital of Tbilisi when troops unleashed violence to break up a peaceful protest. In the autonomous region of Abkhazia there is social tension between Georgians and Abkhazis which has led to clashes. There have been nationalist demonstrations in Moldavia against the Slavicisation of Latin culture. In Uzbekistan there have been attacks on Meskhetian Turks who were forcibly resettled there during the war.

The list is long and no solution seems to be in sight. But the independence movements in the Baltics are indeed the most ominous. The politburo of the CPSU recently set out the limits to republican autonomy in a policy document that concedes the need for radical transformation in the Soviet federal set up. But it does not concede the assumed right of the republics to pass legislation which the union decides is beyond the framework of republics' authority and says that such laws will be subject to repeal by the Union. Baltic nationalism will no doubt be dismayed. However, the nationalist movements will pressurise the Soviet government to find a solution soon, for the dam is close to bursting.

COTTON

'Crisis of Plenty' Unlikely

WHAT is one to make of the Shetkari Sangathana's representation to the union textile minister Ram Niwas Mirdha pleading for an export quota of 10 lakh bales of cotton to 'avert distress sales by farmers'? The plea has been based on an estimated record crop of 120 lakh bales in 1989-90, carryover stock of 25 lakh bales and import of two lakh bales recently allowed under OGL, raising total availability to 147 lakh bales against domestic consumption of about 100 lakh bales. The supply-demand equation worked out by the Shetkari Sangathana is unlikely to command much credibility as it is based on highly questionable assumptions.

It is too early to make any meaningful forecast about the crop and the Sangathana's estimate of 120 lakh bales is generally regarded as highly optimistic. Even the carryover stock figure of 25 lakh bales is reckoned as on the high side. Besides, domestic off-take—mill and extra-factory consumption—is certain to exceed 100 lakh bales by at least five lakh bales. The figure for 1988-89 is placed at 104 lakh bales.

Climatic conditions in almost all the major cotton growing areas have been quite favourable thus far and on current reckoning the crop prospects appear reassuring. But with many crucial weeks still ahead, it is altogether premature to make any worthwhile assessment of the crop which is grown under widely varying agronomic conditions. The quality of the crop information system being what it is, one can never really vouch for the size of the crop even at harvest time. The 1988-89 season ended with August but there is still no unanimity about the size of the crop, with estimates varying from 104 lakh to 106 lakh bales. Nor is there any firm consensus about the size of the carryover stock.

The Sangathana's representation for a large export quota so very early in the season has a strong political overtone, intended apparently to appease the powerful cotton lobby. Where is the question of 'distress sales' by farmers in Maharashtra when the state is operating a monopoly procurement scheme under which cotton growers are guaranteed support prices fixed by the central government plus an additional bonus in the event of the Maharashtra State Co-operative Cotton Growers' Marketing Federation realising higher prices over the entire season. Considering the two successive hefty hikes in support prices, growers can have little cause to complain if in a season of really over-abundant supply they are unable to realise prices higher than the support prices.

That the Shetkari Sangathana's plea for a large export quota is premature and is based on questionable assumptions does not in any way detract from the need for evolving a dynamic export policy to bring about a better balance in the overall supply-demand equation and rectify varietal imbalance resulting from a major breakthrough in the production of long and extra long staple cotton which now accounts for almost half of the total output. New Delhi will do well to carry out its exercises to evolve policy options on the basis of varying crop estimates.

If the crop turns out to be as good as is widely anticipated, it will be possible to spare sizeable quantities of Bengal Deshi and extra long staple cotton for export. The government will need to take appropriate steps to ensure that it does not repeat the blunders it committed last season. Out of a total export quota of two lakh bales divided equally between Bengal Deshi and extra long staple cotton, actual exports during the 1988-89 season are placed around 75,000 bales. The shortfall has had nothing to do with the availability of requisite quality cotton or with export parities. In fact, seldom before has the international environment been so very favourable, with the spread between cotton prices at home and abroad ranging between 20 cents and 40 cents a kg in respect of Bengal Deshi and between 40 cents and 80 cents a kg for extra long staple cotton. The poor export performance last season is attributable entirely to the undue delay in the announcement of minimum export prices which were fixed arbitrarily in complete disregard of the prices prevailing in the highly competitive overseas markets. This encouraged unscrupulous elements in the private trade to indulge in all sorts of malpractices in negotiating export deals with the result that neither the experienced traditional exporters nor the CCI and the other state/co-operative agencies could participate in the highly profitable export business. The subsequent revision of MEP for extra long staple cotton came too late to enable exporters to negotiate fresh business to fully utilise the export quotas.

The government's failure to avail of the extraordinary opportunity for exporting cotton reflects poorly on its management of improved supply in the context of the imperative need to augment the country's foreign exchange resources. Only the textile industry could feel happy over the poor export performance as it has the effect of depressing raw material prices through increased domestic availability. As part of its subtle PR exercise, the Indian Cotton Mills' Federation did not miss the opportunity of complimenting the government for its "thoughtful management of the cotton policy" on the plea that this had imparted some stability in the economic working of mills.

The 1988-89 cotton season which ended with August is notable for a measure of price stability not seen for many years. Rarely has the official wholesale prices index for raw cotton been known to have moved in so narrow a range—13 per cent—as it did last season. There was nothing like a fag-end of the season in terms of supply as well as prices. The highest prices recorded in April were never repeated thereafter. But the price stability was not due to any well thought out policy. It simply reflected a better balance between domestic supply and demand. Besides, unlike in the past, crop estimates put up at the CAB meetings by members representing diverse interests did not show any wide variations. Starting with a preliminary estimate of 108 lakh bales about the beginning of the season, the crop estimate was soon revised to around 104 lakh bales which has never been seriously questioned thereafter.

The demand for cotton is derived from the demand for yarn/cloth. The state of the textile industry therefore has important implications for cotton. Some observations on the overall performance of the textile industry seem pertinent in an assessment of the emerging cotton scenario. If one were to go by the increase in the number of closed mills to a record 144, the further decline in the share of composite mills in the total cloth output to 21 per cent and massive technological obsolescence, one would be inclined to think that the fortunes of the organised mill sector are on the decline. However, talking to a cross-section of knowledgeable persons connected with the industry and the trade, the impression one gathers is that the industry has not had it so good for many years, having enjoyed the rare benefit of cheap raw material and high prices for yarn and cloth. The profound change in the fortunes of the organised mill sector has been attributed to assured availability of cotton at fairly stable and reasonable prices throughout the season, improved domestic off-take of yarn/cloth and a veritable boom in textile exports. Spinning mills had generally been performing well because of the ever increasing demand for yarn from the expanding decentralised weaving sector. Only composite mills had been having a tough time owing to intense competition from powerlooms enjoying distinct cost advantage because of their lower overheads, lower wages and lower capital cost. Of late, these composite mills too have been doing well, with several units going into an area of production where powerlooms are ill-equipped to compete. Symptomatic of the profound change in the textile scene are reports that an increasing number of composite mills are now willing to undertake rehabilitation and modernisation of their equipment and that timely supply of requisite machinery from indigenous sources is proving a major constraint. Reputed machinery manufacturers who until about a year ago were complaining about lack of demand are now quoting delivery dates extending beyond two years.

Lest one is carried away by the idea that

the recent favourable turn in the fortunes of the organised mill sector marks the end of its problems it needs to be pointed out that the sickness in the industry is endemic and that the malady afflicting it is deeply rooted in structural and management deficiencies. No worthwhile progress has been achieved in dealing with the basic issues spelt out in new textile policy announced in June 1985—be it modernisation of cotton ginning facilities or textile machinery, closure of non-viable units, check on the growth of unauthorised powerlooms or making cloth available to consumers at affordable prices.

From the viewpoint of cotton, the most significant aspect of the textile scene is the increase in mill consumption of cotton which touched a new high of 98 lakh bales in 1988-89 as also the improved viability of mills' operations. Going by the textile industry's increasing demand for cotton, the new crop will have to be really a bumper one—over 115 lakh bales—to meet the industry's growing needs at 'reasonable' prices and also leave a sizeable surplus for export. There is little reason to fear that a bumper crop will lead to a 'crisis of plenty', pushing prices below the support levels and compelling growers to resort to distress sales. For there exists a good market abroad for cotton found surplus to domestic requirements.

LEATHER EXPORTS

Unexploited Potential

THE Council for Leather Exports (CLE) has drawn up an ambitious plan to step up export earnings substantially during the Eighth Plan period. Sometime back a target of Rs 3,500 crore was fixed for the terminal year of the Eighth Plan (1994-95). However, now it has been decided to increase the export earnings of the sector to Rs 5,000 crore by 1994-95 and Rs 10,000 crore by the turn of the century.

Export earnings from leather increased to Rs 1,608 crore in 1988-89 from Rs 1,245 crore in 1987-88, Rs 931 crore in 1986-87 and Rs 672 crore in 1985-86. They are expected to cross the Rs 2,000 crore mark in 1989-90, the terminal year of the Seventh Plan. The world market for leather goods has been expanding fast and India can benefit from it by adopting a proper strategy. At Rs 1,608 crore worth of exports in 1988-89, India accounted for only 2.6 per cent of the world trade in leather items.

The export strategy for the leather industry is currently being finalised in consultation with the Council for Leather Exports and other concerned organisations. Scrapping of the reservation of leather and leather products for the small sector, creation of a special organisation of the development commissioner under the industry ministry for the leather industry, delicensing of the industry, excise exemption for manufacturing leather components and immediate improvement in the movement of export cargo are some of the policy measures said to be under consideration by the government as part of the Eighth Plan strategy for the leather industry. Under the present industrial policy, manufacture of leather from raw hides and skins up to the semi-finished stage and manufacture of leather goods, garments and footwear are reserved for the small-scale sector with investment in plant and machinery up to Rs 35 lakh. Of course, the government has recently allowed big companies like Larsen and Toubro to set up large capacities for production of complete shoes with the condition that they will have to export 75 per cent of their production from the third year of production.

Leather garments and shoes are expected to account for a major share in the ambitious export drive being planned for the Eighth Plan period. Quite a few big companies have shown an interest in establishing capacities for the manufacture of shoes for the export market. Possibilities of joint ventures are also being explored. South Korean footwear manufacturers who are now seriously engaged in setting up offshore production facilities regard India as a high prospect area for collaborative joint ventures for marketing footwear. The Footwear Design and Development Institute (FDDI) has drawn up a 30-month action plan and efforts are under way to set up industrial complexes for the leather industry in West Bengal, Punjab and Tamil Nadu.

The leather garment segment has recorded a spectacular growth during the last few years and the number of units manufacturing leather garments has jumped up from 22 in 1982 to 125 now. Most of these units are concentrated in Tamil Nadu, Maharashtra, Delhi, MP and UP. According to official estimates, the production capacity for leather garments has gone up from 11 lakh pieces in 1986-87 to 18 lakh pieces in 1988-89. The export earnings of this sector have increased from Rs 62.26 crore in 1986-87 to Rs 166.15 crore in 1987-89. There is brisk demand from UK, West Germany, USA and France.

Apart from shoes and leather garments, the emphasis will have to shift generally to high value added items. This will be possible only if the industry modernises at a much faster pace. Nearly 80 per cent of the world trade in leather now consists of high value added leather products while India's export basket consists of such items only to the extent of 50 per cent. The chairman of CLE, M M Hashim, has called for the creation of a special fund for modernisation of the leather industry to be operated by IDBI to accelerate the process of modernisation of this industry.

Another major constraint in the coming years will be the shrinking availability of hides and skins. The recent decision of the government to stop exports of semi-processed leather totally will help in easing the problem to some extent. Even so efforts will be needed to ensure increased availability of hides and skins.

TWENTY YEARS AGO

EPW, September 20, 1969

Chou En-lai and Kosygin have taken the world by surprise by their meeting at Peking airport. The meeting came in the midst of growing rumours of possibilities of a large-scale Sino-Soviet clash or even a pre-emptive Soviet attack on China's nuclear installations in Sinkiang. From talk of a pre-emptive attack to a summit was an anti-climactic change indeed...The two prime ministers had last met in February 1965. A lot of blood has since flowed down the Amur and the Ussuri. Sino-Soviet differences have deepened. The cold war has more than once threatened to become hot. It would be too much, therefore, to expect that the airport meeting could achieve any miraculous results. The Chinese and Soviet positions are so much at variance with each other, not only on the border issue, but on every conceivable issue, that a summit can hardly lead to their congruence... But talks need not necessarily be about peace and reasonableness. It seems probable, nevertheless, that the Kosygin-Chou talks have postponed (for how long, one does not know) the Sino-Soviet confrontation. The Soviet Union has probably realised the futility of the extravagant publicity it gave to the Ussuri incident. It has not taken it anywhere. In east Europe the Soviet Union is rapidly losing the initiative. The Soviet leadership must have, therefore, felt the need to buy time, and this summitry may thus have been an exercise in buying time.

* * *

From Capital View by Romesh Thapar

If we were to rely on the information put out by All India Ratio, the Films Division, the Press Information Bureau and the Directorate of Advertising and Visual Publicity, we would become political morons. To base ourselves on the conjectures about possible developments in the national press would be equally deadening. Indeed, the lack of information and understanding between various sections of our people is now a major problem. No amount of speechification is going to cure it. Only sustained, organised activity at the grassroots is the answer... Indira Gandhi, in the course of her nation-wide tour, is sparing no opportunity to stress this forgotton fact at party meetings... There's no respite for Indira Gandhi—not until she finds the new instruments for her policies. And that's going to be quite a hunt, with the talented very demoralised, the opportunists to the fore and the fixers forever fixing. But at least she has the measure of her opponents. Proff: they don't want to call the AICC!

IOC

Fair Improvement

INDIAN ORGANIC CHEMICALS (IOC) has registered a fair improvement in its working during the year ended March 31. Turnover has reached a new peak at Rs 156 crore against Rs 92 crore previously and yielded a gross profit of Rs 17.48 crore against a trading loss of Rs 1.63 crore. After necessary provisions, there is a net profit of Rs 5.44 crore compared to a net loss of Rs 11.12 crore. The directors have recommended a dividend of 10 per cent which was passed over last year.

Production and sales of most of the chemicals showed an upward trend. In particular, alcohol-based chemicals were in good demand. Production capacity of benzaldehyde is being increased in stages to 2,000 tpa. A capacity of 1,000 tpa is expected to be reached during the current year. Further improvements have been made in the quality of glyoxal, the production of which was started in February, 1987. The government has allowed broad banding facilities to the company in respect of alcohol-based chemicals. An application has been made for grant of letter of intent for increasing the production capacity of these chemicals from 14,700 tpa to 24,700 tpa.

Production and sale of fibre by the company during the year were marginally higher than in the previous year, but margins were under severe pressure on account of steep escalation in costs of major inputs, viz, DMT, PTA and MEG. The year witnessed increase in the prices of these raw materials by 60 per cent to 135 per cent. The domestic market for polyester fibre being stagnant, the company has undertaken to explore export opportunities. A significant achievement has been made in this direction by exporting fibre to various European. Far Eastern and West African countries. With the government having placed the export of polyester staple fibre under open general licence, this division would achieve considerably higher levels of exports during the coming years. The production capacity of polyester filament yarn could be utilised fully.

Performance of the 'Sonata' software division has not been satisfactory, but the division has established a good product portfolio with improved customer base in the Indian market. In the area of desk top publishing, the division has been the first to launch in the domestic market a package called 'Prakashak', in 10 Indian languages; this package works with postscript printer.

STANDARD MILLS

Same Margins

STANDARD MILLS' name is proposed to be changed to 'Standard Industries' and its existing equity shares of the face value of Rs 100 each are to be sub-divided into equity shares of Rs 10 each. The company has fared well during the year ended March, 1989 with a gross profit of Rs 12.08 crore on a turnover of Rs 159 crore against Rs 14.64 crore and Rs 179 crore, respectively, in the previous 15-month accounting year. Net profit is Rs 3.97 crore (Rs 5.35 crore). The unchanged dividend of 20 per cent is covered 1.80 times by earnings as against 2.44 times previously.

The company installed during 1983 new Ruti 'C' looms of wider width which are being fully utilised for export production. The company achieved an export turnover of Rs 1,794 lakh (FOB) during the year against exports of previous 15 months amounting to Rs 1,728 lakh (FOB). The company decided to conduct the business of the textile division of Surat Cotton Spinning and Weaving Mills. comprising of 48 Sulzer looms, 126 Ruti 'C' type looms and 72 wider width Ruti 'B' type looms, from April 1, 1989. All this weaving capacity will be utilised for production of quality fabrics for exports. It is expected that the capacity of Surat Cotton will add Rs 10 crore to exports in about two years' time. Surat Cotton has also a large process house which will be used for processing of textiles for the local market as also for exports. It has a modern spinning plant with 30,000 spindles with the latest preparatory machines for weaving.

MAFATLAL INDUSTRIES

Selective Modernisation

MAFATLAL INDUSTRIES has decided to keep up the pace of selective modernisation, introduce better product mix with quality standards and divert maximum capacity towards export market As a part of its modernisation programme, the company spent during 1988-89 Rs 6.77 crore which included 20 airjet looms and other balancing equipment. Exports of the textiles division reached Rs 22.45 crore, primarily to premium export markets of the US, Canada, the UK, Switzerland as well as to non-quota areas like the Middle East, Japan, Australia, etc. The company has worked out an arrangement with Tootal Textiles of the UK for wide ranging distribution of processed fabrics in premium markets abroad. This has resulted in a substantial improvement in the production facilities, training,

thorough maintenance and attention to details leading to absorption of latest technology and upgradation of quality.

After passing through difficult times for several years, the company's chemicals division turned the corner with sales reaching a new peak. Though development work on 2.6 diethyl aniline was completed, it could not be implemented due to government's fiscal policy. A few speciality chemicals for which processes have been developed will go into production in the near future. The company has performed well during 1989. It has earned a gross profit of Rs 9.78 crore against Rs 5.67 crore in the previous year following sales of Rs 117 crore against Rs 104 crore. These figures also show a marked rise in profit margins. With depreciation claiming Rs 9.13 crore (including 2.33 crore in respect of preceding year) against Rs 2.95 crore, however, net profit is only Rs 65 lakh compared to Rs 227 lakh of 1987-88. A substantial part of the unchanged dividend of 20 per cent is thus short earned. The profit figures have been arrived at after writing off an amount of about Rs 7 lakh spent on the computer software project and Rs 90 lakh being the outstanding loan and investment in Mafatlal Zinser Engineering Company. The company's earnings in foreign exchange amounted to Rs 21.77 crore and value of imports and other expenditure in foreign currency Rs 4.12 crore.

LIC

Bonus to Policyholders

LIFE INSURANCE CORPORATION's bonus under 'Whole Life' policies has been increased from Rs 77.50 to Rs 80 per thousand sum assured per year, while the bonus under 'Endowment' policies has been increased from Rs 62 to Rs 64 per thousand sum assured per year.

Valuation is a statutory requirement under Section 26 of the Life Insurance Corporation Act. It has disclosed a surplus of Rs 1,187.98 crore as against a surplus of Rs 952.65 crore in the preceding valuation as on March 31, 1988. Of this surplus, an amount of Rs 1,128.58 crore, representing 95 per cent is allocated for distribution among 'with-profit' policyholders. The remaining amount of Rs 59.40 crore has been allocated to the central government, being its 5 per cent share of the surplus.

LIC has also declared a bonus of Rs 5 per thousand of cash option under Group Deferred Annuities. Final additional (terminal) bonus has also been announced. It ranges from Rs 50 to Rs 350, depending upon the term of the policy. For a 'Money Bank' policy of 20 years, the final additional bonus is Rs 25 and for a policy with term of 25 years, it is Rs 40.

Grasim Industries

GRASIM INDUSTRIES is going ahead with the implementation of its Rs 400-crore gas-based sponge iron project with a licensed capacity to produce 6 lakh tonnes per annum of sponge iron. In line with the government's licensing policy, the plant should be able to produce up to 7.5 lakh tonnes of sponge iron per annum in due course. To part finance the sponge iron project Grasim is raising Rs 125 crore through an issue of 12.5 per cent partly convertible debentures of Rs 120 each on rights basis. The project is being set up at Salav, district Raigad, a backward area of Maharashtra. This project is eligible for sales tax exemption for ten years on purchases and sales.

Grasim has tied up with Hylsa S A de C V of Mexico, for the technology. Basic engineering for the project will be done by Davy Dravo, a division of Davy Mckee Corporation of the US.

Grasim is issuing 1,04,16,666 12.5 per cent secured, redeemable, partly convertible debentures of Rs 120 each at par, aggregating Rs 125 crore to existing equity shareholders including Non-Resident Indians on rights basis, in the ratio of 21 debentures for every 100 equity shares held (on the enhanced holding as a result of conversion of convertible debentures on March 31, 1989), subject to a minimum of 10 debentures to each equity shareholder. Over and above this, 5,20,834 debentures aggregating Rs 6.25 crore have been reserved for the company's employees and working directors. Each debenture will have a face value of Rs 120 comprising a convertible part of Rs 60, and non-convertible part of Rs 60. The convertible part of Rs 60 will be automatically converted into one equity share of Rs 10 each at a premium of Rs 50 per share on June 1, 1990. The non-convertible part of Rs 60 will be redeemed in 3 equal annual instalments in the 7th, 8th and 9th years from date of allotment. Interest at 12.5 per cent will accrue from date of realisation of the application money.

The subscription list will open on September 27, 1989 and will close on October 26, 1989.

Canbank Mutual Fund

CANBANK MUTUAL FUND is launching another 'Growth Fund' on the lines of Canshare, i e, Cangrowth. Cangrowth is a redeemable non-debt security of the face value of Rs 10 each. All incomes and capital gains received under this scheme will be re-invested, after making sufficient provisions for meeting expenses. The trustees may declare reasonable dividend before re-investing the returns. This is a close-ended scheme for an amount of Rs 30 crore, with an option to retain over-subscription. The trustees shall initiate measures to redeem the fund after expiry of 5 years but not later than 7 years from the date of initial issue of scrips. Net realisations on redemption will be distributed equitably by the trustees to the holders of the Cangrowth. Income of the Canbank Mutual Fund by way of dividend on investment or by way of capital gains will be exempt from tax. Cangrowth shall be listed on all major stock exchanges and will be easily transferable. The amount payable on application is Rs 10 for each Cangrowth and for a minimum number of 100 scrips or in multiples thereof. Offer for Cangrowth shall open on September 25, and will close on October 7.

Pix Transmissions

PIX TRANSMISSIONS is coming to the market in the third week of October, 1989 with a simultaneous public issue of 15 lakh equity shares of Rs 10 each and 3 lakh 14 per cent fully convertible debentures of Rs 100 each, both at par, to finance the longterm working capital requirements and capital expenditure for modernisation and expansion of manufacturing facilities. Out of the equity issue, 9 lakh shares are intended to be reserved for promoters and associates besides the usual reservation for the company's employees. A sum of Rs 50 out of the face value of each debenture will be converted into 5 equity shares at par from the date of allotment of equity shares and debentures. The balance of Rs 50 will also be converted into such number of shares at such a price as may be decided by the CCI at the expiry of 3 years. The applicants will be free eithre to apply for equity shares or for debentures or for both.

The company, promoted by Sethi Brothers, makes industrial v-belts as its factory at Nagpur and is a large exporter of these belts. The company proposed to expand production capacity and to manufacture raw-edge v-belts as well as special type of v-belts for purposes of import substitution. Besides, it intends to establish a new unit or the manufacture of medium and high pressure hoses. The company earned a net profit of Rs 60 lakh on a turnover of Rs 661 lakh for the period ended March last and hopes to reward its shareholders with a minimum dividend of 15 per cent for the current year.

Musing on Run-Up to General Elections

Arun Ghosh

While Doordarshan mouths only the views of government spokesmen, most of our national news media reflect the views of one senior journalist or the other. There is little opportunity to know what is going on in the minds of the millions of our voters, interspersed through some 1.2 million square miles of territory (some of it outside our control).

THE news media—and I do not mean the Doordarshan which presents only the official viewpoint on all matters—promise a colourful general election to the next Lok Sabha. However, when one peruses the papers, one finds that the daily papers are by and large Delhicentric; they reflect the views of some very respected personalities, professedly not confined to an ivory tower but in fact very much so. Perhaps they are prisoners of their own ideas and ideologies. Assuredly, they have no time nor the inclination to go out and meet the *hoi polloi*. And the intrepid, young, investigative reporter is unable to claim too much space, at any rate, never in the centre-pages of most national dailies.

As a result, while the Doordarshan mouths only the views of government spokesmen, most of our national news media reflect the views of one senior journalist or the other. There is little opportunity to know what is going on in the minds of the millions of our voters, interspersed through some 1.2 million square miles of territory (some of it outside our control).

So, one can only speculate, gathering little bits of half truths and opinions from 'provincial' denizens whom one may chance to meet. It may be useful to record these somewhat imperfect and incomplete impressions, if only to evoke a response from those who know better.

If I were an eighteen-year old today, born in the first half of 1971, what would be my reaction to the politics of the day, to the coming general elections? Of course, much would depend on the circumstances of my birth. But leave aside a few favoured citizens of Delhi, Bombay, Hyderabad and Bangalore. The probabilities are I would grow up as either a restless rural labourer, aspiring to seek my fortune in the nearest metropolis or as an unemployed graduate learning to live by my wits in either a burgeoning or a decaying urban area. In any case, I would be exposed to all the temptations of the 'goodies' supposedly enjoyed by the rest of the population; and the easiest way then open to me would be to tag myself to the local political 'dada', and enjoy the crumbs thrown at me. I would get attuned and insensitive to all the injustices and cruelties perpetrated by me at the bidding of my *annadata*. It would be the same whether I join the army or the CRPF or as a labourer (through the influence of my political 'dada') in one of the innumerable factory complexes coming up along the HBJ pipeline, or the Bombay-Pune highway or the Lucknow-Kanpur road, or in the periphery of Hyderabad or Bangalore or Baroda.

In any case, the level of my formal education has been rudimentary, the level of my political education quite different from what one would desire in the interest of the development of democratic institutions. For one thing, my centre of interest is essentially local; I have never had the opportunity to think in high-falutin terms about ecology, environment, the 'rights of man', even my own rights, duties and responsibilities. These are all remote concepts; the pressing need to make a living is overwhelmingly important. And, in this context, purely local pulls and pressures influence my political creed.

I would, of course, be a little bewildered by the national news. I would have heard of the Bofors controversy—mainly in terms of catchwords and phrases—and of other stories of big corruption in Delhi. But Delhi is far away; events in Delhi are remote. It is local level corruption and influences that affect me; and my reaction depends on whether I am part of the system—may be ever so small a part—or outside it. If I happen to be part of the system, I would obviously indulge in a little pettifogging cheating—on a small scale—and with time, I would get bolder as I see others, especially my superiors, doing the same. For whom would I cast my vote? Obviously, I am part of the system; I will vote for whomsoever my 'dada' benefactor tells me to. He can doubtless read the political future better than me and I am tied to his apron strings.

What if I am not part of the system, and am a victim rather than a beneficiary of the pervasive corruption in the country? For most part, I am impervious and indifferent to these happenings, especially if I am from a rural background. This is a part of life, and I have grown up with it, and accept it. If I am an urbanite, my reactions are totally different, I suffer from the system every day, but I do not know which way to turn. Anger is seething inside me, but I have to bottle it up. I am certainly unlikely to vote for the ruling party, but I am not sure whether the others are any better. My political education is not informed by any 'philosophy'; it is a homespun distaste for the current state of things.

But then even in the village, not all of my age would have accepted the goings on philosophically. The increasing influence of the TV on my attitude to life needs to be reckoned. Of course, I do not own a TV set, nor do I get to view it regularly. But information filters through; the demonstration effect of the rapidly growing 'consumerism' is quite strong. Also, the repeated drumming by the Doordarshan of information regarding the tremendous progress made by the country is hearsay. Have I got any benefit out of it? Most likely not, in which case, I would only have resentment welling up inside me. For, my mother has to go and fetch our drinking water from some place, and my little sister has to collect the twigs required for cooking the evening meal. That is my only hot meal; the next morning I will have the leftover *chapaties* for breakfast, and again, *chapaties* and an onion and chillies for lunch. If, that is to say, I get work under the Jawahar Rozgar Yojana or wherever. Else, I may stay home, tend to the cows, and dream.

For a slightly higher age-group of people, say above 25, we have seen several elections; and my reactions are best summed up by Laxman's cartoons. It is a case of *deja vu*. I enjoy being taken out on a truck to attend some rally, or a meeting addressed by some political bigwig. It is a real treat if it is the prime minister I get to see. I enjoy even more the Rs 15 or 20 given to me for attending the rally. A good handout for a day's outing. But do the rallies or the election speeches in these elaborately organised *melas* influence me at all? For the most part, I cannot understand what is being said. I clap when I see others clapping. It is some

Excerpts from the Statement of the Chairman, ***Mr. P. D. Kothari*** *at the Sixth Annual General Meeting held on 8th September, 1989 at Madras.*

CHAIRMAN'S STATEMENT

It is my pleasure to welcome the members to the 6th Annual General Meeting of your company.

ECONOMIC TRENDS: 1988-89:

The year 1988-89 is characterised by a remarkable recovery and by all accounts the year promises to be exceptionally good for the Indian Economy. Agricultural production has gone up by 17 to 20 per cent and industrial production by around 9 per cent. The rate of inflation has been brought down considerably from 10 per cent in March last year. According to World Bank assessment, the Indian Economy has shifted to a "higher growth path". Capacities built up through the plans, Government's policy changes and the administration's responsiveness to emergency situations have ensured sustained growth of the economy. Household Sector's aggregate savings performance has been consistently good, a growing proportion of it taking financial forms. Government's policies to strengthen the economy's financial structure, improve its operational efficiency and contain inflation will certainly support the savings performance. Besides, Financial Institutions, through their innovative policies, have helped the growth of capital markets. This, in turn, will stimulate savings.

The economic upswing will help further growth of income and savings, thus strengthening and broadening the economic base.

HIRE PURCHASE AND LEASING COMPANY:

The industry is in a significant phase of its development, with the support from banks and financial institutions adding a new dimension to it. The industry is making a significant contribution to the growth of other industries, especially to the consumer goods industries.

The issues the industry has had to contend with relate to Sales tax, absence of uniformity in the Sales Tax Laws enacted by the States, charge of minimum tax on book profits, new RBI guidelines regarding deposits with non-banking finance companies, limitations on bank borrowings etc. The Motor Vehicles Act, in force from 1st July '89, protects the interests of hire purchase financiers despite certain lacunae. Commendable are the services of the Hire-Purchase and Leasing Associations in sorting out these issues with the appropriate authorities.

With the support extended by the Government, the RBI, the Financial Institutions and the Banks, the future of the industry is bright.

COMPANY'S PERFORMANCE:

Your company has earned a gross income of Rs. 88.19 lacs and an operating profit of Rs. 75.79 lacs for the seven months period ending 31st March 1989. The gross assets stood at Rs. 716.47 lacs at the end of the period. After providing for depreciation of Rs. 10.60 lacs, interest of Rs. 41.56 lacs and minimum tax on book profits of Rs. 4.00 lacs, the net profit for the period amounted to Rs. 19.63 lacs. Your Directors have recommended dividend of Rs 1.20 per share which works out to 20.57* on an annualised basis. The resulting outflow amounts to Rs. 10.20 lacs.

Your company has been taking steps during the current year to augment its resources with the objective of increasing the volume of business substantially and maintaining steady progress. The gross hire purchase, lease and other assets are expected to reach a level of Rs. 10 crores at the end of the year. Your company is constantly on the look out for new avenues of augmenting income by undertaking share registry work, merchant banking services and exploring possibilities of promoting potentially viable projects which will strengthen operations in the long run.

KOTHARI ORIENT SCHOLARSHIP:

Considering the growing emphasis on the need for development of managerial skills in the country, your Directors have decided to institute two scholarships of Rs. 10,000/- each, entitled "KOTHARI ORIENT SCHOLARSHIP" to children of the shareholders of the company holding 200 or more shares, to pursue management education in any of the All India Institutes of Management. Eligible candidates will be selected by an independent panel of experts every year.

CONCLUSION:

On behalf of the Board of Directors and on my own, I thank our depositors, shareholders, bankers and the IDBI for their continued support and encouragement.

PRADIP D KOTHARI
CHAIRMAN

Madras
8th September 1989

NOTE

This does not purport to be the proceedings of the Sixth Annual General Meeting.

sort of reflex action. The holiday is over as soon as I am transported back home, though I must say the organisers are not so solicitous or anxious about the return trip as about the outward journey. But I have got used to that. I make a beeline for the truck which brought me, as soon as the function is over, even though it may be a few hours before the truck starts for home. In between, food and water are both scarce, though I have become used to that also, for what is one day without a mid-day meal? I keep a little *sattoo* in a pouch made from my *dhoti*, and tucked near my waist, as a matter of precaution.

But the brief point is, whatever was said in the meeting went in through one ear and out the other. Though the picture of the prime minister remains etched in my memory. What a handsome person! And how well he speaks! Yet, for the life of me, I do not remember a word of what he said. I was too spellbound to listen. I would certainly vote for him, though I cannot say I will vote for the Congress(I) candidate—the sarpanch of a village not so far away. I have heard all manner of evil stories about him. I really do not know for whom I will vote. They all—or most of them—seem to be hell-bent on aggrandising all benefits of government schemes for the benefit of their families, their clan, their close associates. Plague upon all politicians, that's what I tell my friends.

So, in the final analysis, it is the local politics, the local politicians, the local caste, creed and other alignments which will come to the fore. Unfortunately, the areas where 'class consciousness' is a material factor are to few and far between. Even in highly industrialised areas, if I belong to a militant trade union which has earned for me a wage rate around ten times (or more) of the average national income, I am totally tied down to my narrow sectional interests. The concept of the 'working class' is something I do not understand. It is something nebulous, impersonal. I want to maintain the gains my particular union has given me; if possible, I want to increase those gains. In other words, the Leftist philosophy does not count; the Leftist parties are to be supported only when they take up our specific cause; our interests are different from those of the unemployed, of the landless rural workers, of the small and marginal farmers.

And incidentally, neither Sharad Joshi nor Mahendra Singh Tikait is interested in the latter; they are concerned with farmers who have a marketable surplus.

In short, the country is really divided into small, sectional pockets of one type of interest or the other. Except in a few states, political education in terms of alignments of economic classes is still in a rudimentary stage.

Is this too fanciful a picture of the reaction of the electorate in India? There are exceptions, no doubt, particularly in a few states, where politicisation of the masses has made some headway, and where people have started thinking for themselves. This process has also made some headway in isolated areas even in regions which are otherwise in the grip of the landed gentry and other vested interests. In urban areas, there are other forces, some progressive, some reactionary. Nonetheless, there are clear-cut preferences. But, for the bulk of the rural peasantry, especially in the Hindi heartland, may be also in some adjoining areas, political organisation is sorely lacking (even if political consciousness is not altogether absent). And like it or not, this is the vote bank that really counts.

And that is how caste alignments become important at election time. It is a pity, even the progressive Leftist groups are not immune from pandering to such casteist influences. For, if we have any evidence from history, it is that such narrow considerations are swept aside when there is either a towering political personality or a political issue which looms larger than narrow casteist considerations.

What a pity, therefore, that no party has so far been able to rise totally above all narrow (short-term) considerations, and worked consistently for a broad socio-economic outlook and philosophy.

Finally, quite a few Indians are aware of the grave dangers that the country is now exposed to, in regard to an external debt trap. But does that worry that electorate? Obviously not. Nobody knows the problem. Nobody understands these particular issues. Nor even the problem of the steady rising budgetary deficits. Inflation is something people understand; and other than the trading community, everybody dreads it. But the causal relations in this regard are too subtle for the people. In part, the low level of education in the country is responsible for this. In part, the official media, particularly the Doordarshan, hide the facts and present to the people a wholly erroneous picture of the state of health of the economy. People can nail the lie only when prices are rising; or when they cannot get a day's work or full payment for a day's work. Only to this extent does government propaganda become counter-productive. But problems such as the 'external debt trap' to which the administration has inexorably led this country in the space of a mere five or six years are understood only by a few academics in institutions like the Delhi School of Economics. (And unfortunately, even among professional economists there are quite a few who are either in receipt of or are hopeful of receiving dollops which are fairly large by Indian academic standards and who therefore keep silent on this vital issue.) What was it Robert Browning once said, in great sorrow, about Wordsworth? It is best to forget those famous words, which are otherwise so apt today.

So, what emerges? Being neutral to the goings on, watching events from an Ivory Tower, I do not have to worry about the antics of different parties. But I cannot help worrying about the inadequate politicisation of the masses. May be I am wrong. I hope I am wrong. It is possible that in my isolation in a tower of my own making, I am unaware of the rapid politicisation of the country which has resulted from the revolution in communications that we have had over the past decade and a half. But the dangers of vested interests manipulating and controlling the economic destinies of this country remain quite real. The next six months will decide whether we are in for purposive strife in future, or whether this country would continue to be one where we merely talk, never act.

Speech
by
Shri Y. R. Ghorpade
Chairman

THE SANDUR MANGANESE & IRON ORES LIMITED

AT THE THIRTY-FIFTH ANNUAL GENERAL MEETING HELD ON 11 SEPTEMBER 1989

Ladies and Gentlemen,

I extend to you all a very cordial welcome to the Thirty-fifth Annual General Meeting of the Company.

The working of the Company during the year 1988-89 shows an improvement in the availability of power which increased to 67 per cent from an average of 53 per cent during the previous year. This is reflected in the turnover of Rs. 56 crores and profit of Rs. 2.7 crores during the year, after providing depreciation of Rs. 1.27 crore and interest of Rs. 2.27 crores. However, the burdens of the Company are also sizeable due to the increased level of activity and the accumulated losses of the previous years, when the Company had to make a loss of about Rs. 10 crores, during the five year period of 1982 to 1987, due to grossly inadequate supply of power which averaged only 34 per cent, along with a steep rise in power rates. This clearly shows that power intensive industries like ours cannot function on a viable basis unless adequate power is made available on a continuous basis at reasonable rates.

It is in this context that it is vital for the country to think in terms of a national power grid to ensure that such power intensive industries in the core sector are given adequate power. This is necessary to ensure fuller utilisation of available capacities and prevent avoidable imports to save valuable foreign exchange. It is a matter of satisfaction that **SMIORE** has done its bit in this regard in spite of numerous difficulties, and bulk of its production of ferroalloys has gone to the Steel Authority of India Limited (SAIL) during the last two years. Though the open market prices of these ferroalloys are distinctly better than the prices offered by SAIL, yet it has been our policy to meet the requirement of SAIL on a priority basis, and we would be able to further increase our supplies of ferrosilicon to SAIL depending on better availability of power. It is a matter of pride for the Company that it has been able to produce for supply to SAIL even high purity ferrosilicon with 0.2 and 0.1 per cent aluminium, as a result of its own research and development effort. It will be our constant endeavour to maintain the high quality of our products which have been well received by SAIL and other consumers in the country.

With the gradual receding of the slump in the international steel industry, the market for ferroalloys has shown a distinct improvement, including prospects for exports. The Government should take this into account in taking some policy measures to enable this industry to become internationally competitive. Import of low ash coke free of duty would go a long way in replacing charcoal in the production of ferrosilicon, thereby helping to conserve our environment and natural resources, which is a factor that should always be uppermost in our mind. It may be examined as to what would make it feasible for the industry to increasingly adopt energy saving devices which will also serve the purpose of pollution control. A package of measures, including availability of finance on sufficiently easy terms, could be worked out in conjunction with the Industrial Development Bank of India (IDBI) and other financial institutions, so that advantage could be taken of the present situation to maximise capacity utilisation, exports, and the adoption of energy saving and pollution control devices. It is in this context that the adequacy and cost of power to such industry is crucial. As power constitutes about half the cost of production, the economic feasibility of production and the adoption of improved capital intensive technology and cost effective practices are naturally dependent on it.

It is to the vision of Jawaharlal Nehru, whose birth centenary we are celebrating this year, that we owe the rapid industrialisation of our country after independence. Three large public sector steel plants were set up at Bhilai, Rourkela and Durgapur in the 1950s, utilising the most modern technology available at that time. The time is ripe for the steel production in the country to be stepped up significantly. The internal demand for steel is also bound to go up in the years to come. It is appropriate that SAIL is planning to increase steel production from about 9 million tonnes presently to about 17 million tonnes by the end of the century.

This will naturally improve the demand for ferroalloys which is a necessary component in steel-making. Increase of steel production by about a million tonnes per year, on an average, till the end of the century, and more thereafter, will obviously mean creation of fresh steel production capacity in the country, apart from expansion of the existing steel plants. It is here that the priority of the Vijayanagar Steel Plant, in the Sandur-Hospet region, whose foundation stone was laid by Smt. Indira Gandhi in 1971, should not be forgotten. This area contains about a thousand

The Sandur Manganese & Iron Ores Limited

Registered Office: 'LOHADRI BHAVAN', YESHWANTNAGAR 583 124, Bellary District.

million tonnes of the richest iron ore deposits in the world. The Vijayanagar Steel Plant would be one of the best inland steel plants in the country. We are grateful to the Prime Minister, Shri Rajiv Gandhi, for his assurance that whatever best is possible in this regard will be done, using the latest technology.

The international market for our manganese ores, which had been severely affected by the world steel recession, has shown distinct signs of improvement, though the mining, transportation and handling costs have also gone up substantially. However, our mining activity is mainly geared to meet internal demand and, more particularly, for the production of ore with a suitable Mn/Fe ratio for use in our own ferroalloys plant. This strategy has helped the economic viability of both our mines and ferroalloys plant. During the year 1988-89 the production of all grades of manganese ore was 1,35,000 tonnes, of which 41,000 tonnes was exported, including 25,000 tonnes to Pakistan for the first time. The Company has a long record of systematic and scientific mining with maximum attention to ecology and environment, which has resulted in the planting of more than a hundred thousand trees of various kinds in our mining concession during the year 1988-89.

The employees strength at our mines is 1280. As against the statutory minimum wages of Rs. 534 per month, the minimum wages in our mines is Rs. 682 per month. However, the average earning of our employees at the mines is about Rs. 1,400 per month, including bonus of 20 per cent, production incentive, provident fund, leave travel assistance and the foodgrains subsidy scheme under which essential commodities such as rice, jowar, tur dal, sweet-oil, chillies, and jaggery are supplied to the employees at the prices prevailing in 1973. The Company has a number of welfare measures for its 2070 employees with maximum emphasis on health and education, including technical training and development of skills to benefit the employees and the local population.

SMIORE began its career in 1954 with mining activity which enabled it to set up an electro-metallurgical furnace in 1968, followed by two more ferrosilicon furnaces in 1977 and 1980. The chronic power shortage that was experienced in the eighties and the need to broaden the range of its activities, prompted the Company to plan its diversification programme in the less power intensive area of electronics. As a result of its efforts over the past 3 to 4 years, the Company is now poised to take its rightful place in the development of the electronics industry in the country, the turnover of which is expected to increase from about Rs. 10,000 crores in 1989-90 to about Rs. 30,000 crores in 1994-95 and to more than Rs. 60,000 crores by the end of the century. Even with that order of increase of the Indian electronics industry, computer production will only be about 1 per cent of the GNP by the end of the century, as against the present 0.5 per cent in India and 5 per cent in developed countries. The scope for quality conscious units, with commitment to rapid Indianisation and development of technology suited to our conditions, is immense. It is in this spirit that the **Sandur Prominent Fluid Controls Limited,** a subsidiary joint venture Company, with technical collaboration and 40 per cent equity participation by ProMinent Dosiertech-nick GmbH, West Germany, was started. Its electronic dosing pumps have been well received in the Indian market. During 1989-90, 50 per cent of the components of this pump will be indigenous. This is a versatile pump which can be very useful for a variety of applications in process industries and water and effluent treatment.

SMIORE's electronics division at Bangalore provided the manufacturing support for the export of more than 6,000 printers to Russia. **SMIORE** has its own programme of manufacturing computer printers, in collaboration with Kovac and Nakajima of Japan. These printers of 80 and 136 columns, with a speed of 200-240 characters per second, will be manufactured with the latest 9 pin technology which is expandable to 24 pin for near letter-quality printing. In the first year itself, about 50 per cent of the components will be indigenously manufactured and effective steps are being taken to accelerate the phased manufacturing programme.

Data Acquisition and Control Systems is another major area of interest to **SMIORE** which has the technical support of AI Corporation of Japan. **SMIORE** has already developed a menu-driven application software package, "softdac", which has excellent potential for industrial applications and export. India can become a major world force in the development of computer systems and software -- an area in which **SMIORE** will strive for excellence.

I wish to express my deep appreciation of the good work put in by all the employees of the Company. I am grateful to all my colleagues on the Board, the financial institutions and the banks for their valuable guidance and support.

Thank you,

Yeshwantnagar
11 September 1989.

Y. R. GHORPADE

Note: This does not purport to be a record of the proceedings of the Annual General Meeting.

NOTICE

It is hereby notified for the information of the public that **Shriram Honda Power Equipment Ltd.,** proposes to make an application to the Central Government in the Department of Company Affairs, New Delhi, under sub-section (2) of section 22 of the Monopolies and Restrictive Trade Practices Act, 1969 for approval to the establishment of a new division. Brief particulars of the proposal are as under:-

1. Name and address of the applicant	:	**Shriram Honda Power Equipment Ltd.** 'Kirti Mahal', 19 Rajendra Place, New Delhi - 110 008.
2. Capital structure of the applicant organisation	:	EQUITY Authorised capital Rs. 1000 lacs Subscribed capital Rs. 750 lacs Paid up capital Rs. 748 lacs
3. Management structure of the applicant organisation indicating the names of the directors including wholetime directors and managers	:	The Company is managed by the Board of Directors supported by the wholetime directors and a team of highly qualified and experienced professionals BOARD OF DIRECTORS 1) Dr. Charat Ram (Chairman) 2) Sh. Mantosh Sondhi 3) Sh. Siddharth Shriram 4) Sh. Raj Pandit 5) Sh. D. V. Kapur 6) Sh. O. P. Khaitan 7) Sh. V. S. R. K. Sastry (IFCI nominee) 8) Sh. M. Ishihara 9) Sh. K. Osada (wholetime director) 10) Sh. S. Nakamura (wholetime director) 11) Sh. J. S. Iyer (ICICI nominee)
4. Indicate whether the proposal relates to the establishment of a new undertaking or a new unit/division	:	It is proposed to manufacture a new article in the existing undertaking
5. Location of the new undertaking	:	Shriram Honda Power Equipment Ltd., Village & P. O. Bhigwara, Tehsil Kichha, Distt, Nainital (UP).
6. Capital structure of the proposed undertaking	:	No change
7. In case the proposal relates to the production, storage, supply, distribution, marketing of any goods/articles, indicate:		
(i) Names of goods/articles	:	Pumping sets based on Internal Combustion Engines
(ii) Proposed licensed capacity	:	40,000 Nos. per annum
(iii) Estimated annual turnover	:	Rs. 24 Crore
8. In case the proposal relates to the provision of any service, state the volume of activity in terms of annual measures such as value, income, turnover, etc.	:	Not applicable
9. Cost of the project	:	Approx Rs. 20 lacs
10. Scheme of finance, indicating the amount to be raised from each source	:	It is proposed to meet the cost of the Project from Internal Accruals.

Any person interested in the matter may make a representation in quadruplicate to the Secretary, Department of Company Affairs, Government of India, Shastri Bhavan, New Delhi, within 14 days from the date of publication of this notice, intimating his views on the proposal and indicating the nature of his interest therein.

For **SHRIRAM HONDA POWER EQUIPMENT LTD.**

UNCTAD's New Thinking

Satish Jha

Blamed by mainstream developmentalist institutions as soft-headed and by those whose cause it is supposed to serve as ineffective, UNCTAD has been having the worst of both the worlds. However, it is now planning to build a new image for itself and its Trade and Development Report, 1989 *is intended to give an idea of how it is proposing to do this.*

COMPARED to its glorious beginning in the mid-sixties UNCTAD has not been known lately for being an effective instrument of expressing the 'other' viewpoint. Blamed by the mainstream developmentalist institutions as soft-headed and by those whose cause it is supposed to espouse as ineffective, it has been facing the worst of both worlds. Twenty-five years old now, it is planning to build a new reputation for itself. Its *Trade Development Report, 1989* (TDR-89) is supposed to give us an idea how. But if the latest TDR is any guide, it is evident that it may not be easy to evolve an UNCTAD way of looking at things as they are or as they should be.

For one thing, starting from a perspective that promised to offer an alternative way of understanding the world economic system and the question of development, UNCTAD has lately been taking up issues from the mainstream perspective while still siding with the less fortunate economies. For another, even while doing so it offers one view on the question of resources and macroeconomic adjustments and quite another on trade relationships. For instance, its current director-general has been quite active in discussions on alternative development. Yet the report under discussion is categorical in arguing precisely what the 'alternative' school rejects about completely. It has been argued in TDR-89 that growth is the first prerequisite for countries burdened with debt. Such growth-at-all-cost arguments have long been viewed with suspicion by those believing in sustainability, a phrase UNCTAD is itself rather fond of promoting. On the other hand, it is being argued that neither free market nor the state can deliver the goods. What is needed is a pragmatic policy mix. It is easily forgotten though that between the two extremes falls the reality. But doesn't offering such a vast range of policy options essentially amount to saying that nothing succeeds like success? A look at what is argued in the report will make these contradictions clearer.

Broadly speaking, the United Nations system is divided between two viewpoints—those who blame the internal management of the economy for the ills facing developing countries (these include the World Bank and the International Monetary Fund) and those who see the rest of the world as the major culprit in not letting the developing economies do better. Understandably UNCTAD belongs to the latter category. It has argued for long that economic development in the poor countries is constrained by the external environment. It could be falling prices of primary commodities that the poor export, or rising prices of their imports, or exchange rate fluctuations that do not let them plan, or liberalisation which is oblivious to the realities of these economies like absence of a developed entrepreneurial class, or advise from institutions who understand them little and thereby impose alien priorities that distort their development further, etc. Those familiar with this line of argument will find few surprises in the latest TDR. What is interesting though is the claim made by the secretary-general that now the powerful nations are doing what UNCTAD said they should in the last TDR. Just that they do not acknowledge that it was first said by UNCTAD, nor do the steps taken go far enough. There is an implicit suggestion that if only the rich countries agreed to do a little more of what they are doing life will begin to look up for the poor economies as well.

For instance, it is suggested that the Brady plan for lubricating the debt-damaged economies is a "significant and irreversible" step, just that it is not enough and could have gone a few steps further and become a Brady + Brady + Brady plan. If one Brady could reduce the debt burden by a fifth, five will do the trick and all will be hunky-dory for the poor and currently indebted countries. Even for those sympathising with the plight of the poor nations such an approach may be a little too simple, if not simplistic, to be true. This when the Brady plan has been criticised from various quarters for a variety of inadequacies as well as its high-handed approach in pushing the World Bank into a role it has not been expected to play so far. It has been argued by the critics of the Brady plan that it is selective, sensitive to the most immediate US interests and is possibly not multipliable. In any case it would be worthwhile knowing the impact of the Brady plan and its multiples on the world economy as a whole and to estimate its impact, whether positive or adverse, on the nations it is meant to help out. Such an exercise is missing from the TDR and instead the reader has been offered some unsubstantiated and impassioned positions which would hardly move the major players in the world economy. In fact the only criticism that the TDR has of the Brady plan is that it puts stability first which is exclusionary in nature, for that may not be practical for a large number of poorer countries and what is needed is Growth First.

The domestic aspect of economic mismanagement (that should logically stem from the obligation to look at development as well) is barely touched in the report. It has been argued that a consensus should be evolved domestically regarding how various classes could share the debt burden and how the gains of the recovery programmes should be distributed. It is also argued that a major lacuna in existing adjustment programmes has been the drive to privatise on the one hand, and take away private resources to meet the debt burden, on the other. However, while the latter position brings out the contradiction within the domestic economy, the former ignores it and expects that those who have lost out in the game of burdening the economy with foreign debt should again share the costs of removing it. A case could have been made out without diluting the responsibility of the international financial system to argue that any adjustment programme should be paid for only by the beneficiaries of the debt crisis. This is also one problem in getting major industrial countries to agree to a more generous package to diffuse the debt crisis. For they argue, and at times openly, that before asking industrial countries to solve their debt crisis these countries should also look into the Swiss bank accounts of their own nationals and the benefits which have been reaped privately. There is a ring of truth in it which has been silently ignored and vociferously refuted by the leaders of the debt-damaged economies. UNCTAD

too is shy of touching this point however and, while suggesting that any effort towards adjustment must take account of the misery and tension it may create, its prescriptions presume that a benign redistribution of responsibility and burden-sharing will be without any social tension.

The report does hold out a threat to the world at large though—stating that if the adjustments programmes are not adapted to the needs of the developing countries they may try to solve it unilaterally. Unfortunately the risk analysts of the major commercial financial institutions as well as of the governments of the industrial world think otherwise. They know that the debtor countries have willingly tied themselves to international capital and cannot go it alone. It should be clear from the developments so far that it is far from easy to force a solution of the crisis from either side. Efforts to solve it will be selective and the solutions diplomatic. Brady could do it for a variety of reasons which this is not a place to discuss, and he could pull it off because of his financial muscle.

Despite the Brady plan, however, will the countries in need get the new money they so badly need? UNCTAD is not hopeful and rightly so. But after swaps, discounts, exit bonds and the like, commercial banks will continue to lend with an eye on minimising their risk, rather than look after the interests of the debtor nations. Fresh money therefore has to come from other international quarters. UNCTAD does not seem to probe into this aspect except for greater emphasis on intervention by the governments of the industrial economies, for it is only such intervention that made possible the Mexico agreement, etc. But the ability of any government to intervene is limited. And a case for why they cannot go on intervening on the same scale as so far is argued by their position on international trade which sees major upheavals ahead. Then what good is a call for more government intervention?

In terms of international trade TDR finds developing countries in a dilemma. If they go for trade policy reforms their exports may improve but the growth may not be fast enough for investment may still fall and so may imports. At least this is seen to hold good in the case of countries with debt burdens. It is critical for increasing exports only on a robust economic base. It is only those countries where output for domestic consumption also improved that have had the fastest growth and increasing export markets as well. Without improved growth increasing export would add to the fragility of the economy. Liberalisation policies do not seem to take this fact into account. TDR advocates caution on such unbridled liberalisation. External to the developing economies is the fact that while the major economies prescribe free trade they are themselves turning to put barriers on imports. This is likely to limit the options of the poor economies even further. In particular it mentions various protectionist and unilateral measures that the US can invoke under its new omnibus trade laws. It advises large industrial economies to expand exports rather than limit imports. Alongside it is also argued that it is wrong to say that the high dollar was the principal cause of the rising US trade deficit. Even after the dollar came more in line with other major currencies the trade deficit did not come down significantly. Instead, US is facing a rising current account deficit. Much of it, it is argued, stems from declining productivity in the US relative to its major trading partners, particularly Japan.

In the new understanding of UNCTAD the US economy cannot sustain such current account deficits for long. Such a low savings rate as 4 per cent necessitates import of capital which should soon become scarce because of the expansionary drive in Europe in its run up to 1992 and Japan's desire to spread its risk a little less unevenly and therefore its search for non-US markets. In the event the double deficit may lead to a halt or some shocks to the US economy. In one of the UNCTAD scenarios this may be witnessed in less than five years from now. The two routes out of such an impasse could be the US increasing its savings rate by curbing consumption due to what has lately been described by the US treasury secretary as 'now-nowism', investing more and improving productivity or curbing the defence budget. The new peace initiatives and circumstances that may make NATO less relevant can also help the US save to the tune of . 100 billion. However, barring these the US economy is headed towards a shock.

The fact remains that despite its declining share in the world income—from a half to less than a third—and declining share in world trade the US remains the single most influential economy. A shock there is unlikely not to cause fresh imbalances in the world economy with few exceptions. The developing countries must keep such a scenario in mind in shaping their trade and development policies. In UNCTAD's view it is a selective export-led regime that pays dividends. Across-the-board liberalisation is no good for poor economies. And they must watch out against US pressures to reorient their economies in a way that may increase their dependence and make them more vulnerable. If these issues have not been dealt with in TDR, UNCTAD officials promise to do so soon in a new series on the UNCTAD perspective on the world economic situation.

External Debt: Long and Short of It

Between 1985 and 1989 India's debt liabilities grew in rupee terms at a compound rate of 21 per cent per annum. The rate of its growth is being accelerated due to higher interest obligations, larger repayment, and the depreciating rupee.

WHAT was once considered a well-guarded secret by the government is now getting unmasked in the face of undeniable evidence. Even official agencies have begun publishing the statistics. The Reserve Bank of India (RBI) has in its latest annual report come out with a table on India's external debt and also sought to explain, however briefly, the nature of differences between the government data and those put out by 'others' (the reference presumably is to the World Bank, the OECD and the Institute of International Finance).

In the accompanying three tables we have four sets of data on India's external debt and, as the RBI's annual report has brought out, the differences are broadly reconcilable. Its own data do not include NRI deposit liabilities and short-term debt, but the RBI's annual report provides data for NRI liabilities separately. Combining the two sets of data, as has been done in Table 1, the country's total debt (including short-term debt) is seen to have doubled in rupee terms from Rs 39,619 crore in March 1985 to 83,835 crore in March 1989. OECD data presented in Table 2 suggest that India's short-term debt could be placed at about Rs 3,065 crore ($ 2.5 billion) in 1985 and Rs 7,300

Source: *World Debt Tables*, 1988-89 Edition, The World Bank, Washington.

crore ($ 4.8 billion) in 1989. Including short-term debt, therefore, total debt galloped from Rs 42,684 crore in March 1985 to Rs 91,135 crore in March 1989. The latter figure is close to the estimate of the Institute of International Finance (IIF) which puts India's debt at Rs 96,000 crore in March 1989. The estimate of the IIF (which is a private body with considerable clout with the World Bank and the IMF) is the most comprehensive, but even that does not include defence credits, particularly from the East European countries. If these are taken into account as well, total debt would have touched the figure of Rs 1,00,000 crore (or $ 62 billion) in March 1989, marking a more than doubling in a period of four years.

In the four years between March 1985 and March 1989, India's known debt liabilities grew in rupee terms at a compound rate of 21 per cent per annum. Evidence suggests that the rate of growth is getting accelerated due to higher interest obligations, larger repayment, new commitment and the depreciating rupee. On this basis, before March 1991 India's debt would cross Rs 1,50,000 crore or even higher than the figure of Rs 1,33,000 crore reportedly cited by the IIF.

The magnitude of the debt problem can be assessed by a variety of measures—by relating debt to GDP, to export of goods and services, and so on. According to the RBI, the debt-export (of goods *plus* invisibles) rose sharply from 131 per cent in March 1980 to 218 per cent in March 1989. The RBI has also highlighted the rising debt service ratio, from 16 per cent in 1985-86 to 24 per cent in 1987-89. Likewise the government of India's *Economic Survey* for 1988-89 (p 122) had disclosed that debt service on external assistance (excluding servicing of commercial borrowings and IMF credits other than Trust Fund) had grown at an annual rate of 30.6 per cent in the first three years of the Seventh Plan. The subsequent growth has been even higher, especially in regard to commercial borrowings and IMF credits.

Tables 2 and 3 present data from the World Bank and the OECD which suggest that a substantial amount of short term debt particularly from banks (which the World Bank does not cover) explains the difference between two sources: $ 46,370 billion as per the World Bank and $ 50,376 billion as per the OECD (both at end-1987). The growth of such large short-term debt has been indeed alarming because this borrowing is not even linked to any productive projects and the eventual cost is bound to be onerous indeed—if the experience of some of the Latin American countries is any guide.

Management Plays Truant

Workers Initiate Take-Over Plan

B Srinivas

The workers propose to revive the unit under a co-operative scheme. The scheme projects a growth of ten per cent in sales for the first five years of operation. As a result the unit is expected to achieve profit in the first year of operation itself.

IT is not unusual for industrial units to be shut down by managements in unscrupulous ways. In some of the cases, the prolonged closure of sick units ultimately spells doom for the workers who depends on the jobs for their livelihood. In most of the cases, the workers and their unions wage long battles against such closures. In recent years there have been numerous shut-downs, and the younger generation of blue collar workers are in no mood to compromise with managerial manipulations. Some of the unions have taken an aggressive stand against such employers in order to compel the reopening of such units. In Hoist-O-Mech, an engineering unit that provides employment for about three hundred people the workers have initiated a take-over plan.

Hoist-O-Mech is situated in the industrial belt of Thane. Set up in 1963, it engaged in the production of engineering equipment like electric hoists and cranes, which had good market in both the public and the private sector. Its customers include big organisations like BHEL, BARC, and TISCO. Since its inception, this unit has changed its management once. The first management continued till 1978, after which Harish Kohli took over the management of the unit. The unit has a strength of 300 employees, who are represented by the sole union, Homech Employees Union.

The unit experienced prosperity till 1985. Since then, signs of deterioration became apparent and signs of incipient sickness became visible. It was during this period that Kohli floated another company—Gujarat High Tech Industries at Kodinar in Gujarat. The management began neglecting Hoist-O-Mech which worsened matters. Bills to suppliers amounting to Rs 1.30 crore remained unpaid. As a consequence, the suppliers stopped the supply of raw materials. Employees' salaries were not paid in time. Employee contribution to provident fund, LIC, income tax and ESI were not deposited with the concerned authorities. Telex and telephone facilities were disconnected due to non-payment of bills. The sales tax authorities have sealed the company's bank account for the recovery of sales tax due. The Maharashtra State Electricity Board served notices and finally disconnected power due to non-payment of bills.

The condition of the unit deteriorated rapidly and production ceased during November, 1987.

Union's Initiative

The union approached the management in December 1987 and proposed the setting up of various action committees to oversee and supervise the administrative, financial, purchase and recovery work of the company. Accordingly three sub-committees—executive, purchase and recovery—were formed. The chairman, who promised to arrange for the working capital, failed to bring in any funds. At this stage, the union approached its suppliers to resume supply of raw materials.

When the committee took over the operations of the unit, they had to first unfreeze the bank's account that had been frozen by sales tax authorities by paying all sales tax arrears. Likewise, the committee paid the overdue telephone and telex bills and the lines were restored. The committee also undertook the charge of paying off all the pending bills with Maharashtra State Electricity Board. Finally workers' wages and government dues have all been paid.

Producing equipment worth of Rs 59.3 lakh by March 1988, the committee made regular payments to the suppliers and even cleared some of its outstanding statutory dues, as well as the wages pending from November 1987. All through this period, the management's unwillingness to continue production was total. It is alleged that the executive director of the unit had in fact diverted a lucrative order to a competitor on the ground that it could not have been executed in time. The union strongly protested against this action by the management. Matters worsened when the company's general manager of southern region issued a circular to all branches of the unit directing that all the future sale proceeds be sent to the Madras office instead of the Thane office as had been the erstwhile practice.

In January 1988, the union informed the bankers of the unscrupulous practices of the management. The bankers at this stage appointed their auditors to study the deteriorating financial condition of the company. The auditors' report suggested an immediate change in the management if the financial crisis of the unit was to be averted. The auditors' report categorically pointed out the lack of the management's involvement. To quote the auditors:

> We understand that the chief entrepreneurs of this unit has considerable financial interests in certain other industrial undertakings. It is therefore possible that this unit has had lesser involvement of the top-most management than would otherwise have been the case. Consequently, indicators of the impending sickness of this company were either not noticed or having been noticed, were not acted upon.

The auditors informed the management about the sickness of the company in March 1988 but the management made no effort to tide over the crisis. It had not even made a reference to the BIFR which is mandatory for the management when a unit displays symptoms of sickness. On the other hand, the company advertised the sale of the company in the press on April 5, 1988. Though certain entrepreneurs seem to have shown interest in buying the unit, no further negotiations were carried out. Since there was no positive response from the management, Bank of India called for the attention of the chairman and pointed out that, "the position of the company may not be beyond redemption if all concerned, and particularly you (the chairman) make efforts in right earnest".

In April 1988 the executive director who was the only official authorised to operate the bank account deserted the company without authorising any other official to operate the account. This led to a crisis as equipment for despatch worth Rs 10 lakh got held up due to the absence of any authorised signatory. The executive director later authorised the commercial manager to operate the account, but the proposed authorisation was not ratified by the chairman till May 6. Thus due to lack of financial resources, production came to a halt.

The union approached the chairman on May 7, 1988 and prevailed upon him to attend factory work and sign the papers relating to the operation of the account. The chairman after inspecting the plan, instructed the executive committee to send the resolutions to his hotel. But on the same evening he lodged a complaint with the police alleging that workers had indulged in violence and had abused him. On May 8, 1988, the resolution by the chairman authorising a new official to operate the account was submitted to the bank. But Kohli in his subsequent letter to bank maintained that the resolutions authorising the new official be ignored as it was signed under duress.

Based on his complaint, the police arrested some of the workers on May 11 and later released them on bail. On May 13, the management issued notice of a lock-out from May 29. The management cited violence and intimidation of the chairman as the reasons for the lock-out.

The union filed a case in the industrial court and took up the issue with the labour department. The commissioner of labour convened three meetings from which the management was absent. The union sought the intervention of the labour ministry and

pleaded for a joint meeting of union, management and banks. On July 19, 1988 the labour minister convened the meeting in which the management persisted with its allegation of union's intimidation and violence. The minister instructed the management to lift the lock-out and also assured security from the government while the union assured the co-operation of workers in reopening the unit. But matters could not be settled as the management abstained from the subsequent meeting convened by the labour minister on August 31, 1988.

In July 1988, a committee comprising trade unions, researchers and journalists investigated the lock-out. After a thorough enquiry involving consultations with workers, suppliers and officials of the labour department, the committee found the management guilty of financial mismanagement. The committee observed that the management deliberately siphoned off funds to Gujarat High Tech by over-invoicing the value of the raw materials and other purchases in connivance with the suppliers.

The committee further observed that the major motive of the management seemed to be to close down the plant so that in the long run the land could be sold at high prices. The committee recommended the revival of the executive committee with all possible help from the government and banks.

MANAGEMENT'S DENIAL

The chairman of the company dismissed the allegations made by the committee as well as the Homech union. He maintained that the union pressurised him to devolve all powers to the executive committee and that upon his refusal, he was assaulted by union representatives and made to sign the board resolution under duress. According to his note issued to the press, Hoist-O-Mech has higher manpower cost as a percentage of turnover than many other competing companies. The employee cost per man per month rose from Rs 1,671 in 1982 to Rs 3,652 in 1987. The joint management committees were set up, he observed, only to make employees realise the crisis in the company. Instead the union always indulged in assaulting managers. The chairman also dismissed the allegation that there had been over-invoicing of the value of raw materials.

In its subsequent note on the lock-out the management pointed out that the major problem faced by the unit was the deviant practices of the workers. The management maintaining that workmen and their union started making false allegations against the company.

The management pointed out that with the formation of the joint committees, the union and workers became ambitious to take total control of the company. The management alleged that the workmen resorted to various coercive and indisciplined activities, started addressing letters directly to the company's customers and bankers, and forcing the executive director of the company to sign cheques including blank cheques, letters, etc, under duress. The management observed that it was with the assault and abduction of the chairman of the company that the company was ultimately required to effect a lock-out.

The union strongly condemned the management's claims. It maintained that a substantive wage agreement was signed in September 1986 and since then there had been no fresh wage demands. But the management calculated the wages by including both termination benefits and non-salary allowances. The union also pointed out that steel was bought at Rs 16,800 a tonne when the actual market price was Rs 8,500. The union also pointed out that a particular variety of bearings which cost Rs 60 were bought at Rs 390.

In July 1988 the union appealed to the Board for Industrial and Financial Reconstruction (BIFR) to conduct an enquiry and initiate necessary action against the management for closing down the units in spite of adequate assets and orders. The union appraised the BIFR of the manipulations of the management and pointed out that due to the non-payment of dues to creditors, winding up petitions have been filed in court by twenty-seven creditors for recovery of their dues. The union pointed out that the liabilities of the unit include Rs 1.25 crore to sundry creditors and Rs 1.35 crore to banks. It was also observed that the management obtained payments directly from customers after availing discounting facilities from banks. Further, to obtain more and more facilities from bankers, the management showed inflated stocks in the statement submitted to banks.

The BIFR called upon all parties concerned with Hoist-O-Mech for a hearing on February 9. In the meanwhile, the union in a letter to BIFR maintained that the unit though sick at present, is still potentially viable. It observed that an imaginative rehabilitation plan with the involvement of banks, institutions, state government and the workers can help the company to revive the unit. The union also appraised the BIFR of the reluctance of management to revive the unit. In view of such a situation, the union pleaded BIFR to declare the unit as a sick unit under the provisions of Sick Industrial Companies (Special Provisions) Act, 1985. The union volunteered to prepare a scheme to review the company under a workers' co-operative and sought the permission from BIFR to do so.

In the hearing before the BIFR, the board sought the audited report on the performance of the company. It gave banks three months' period to finalise the report. The board also informed the union to file its scheme for reviving the unit.

WORKERS' PLAN

The workers propose to revive the unit under a co-operative scheme. Every worker is to contribute Rs 5,000 which will be credited to the employees fund. The total cash fund will thus be Rs 12.5 lakh. In addition to the cash fund, fifty per cent salaries and wages accrued during April and May 1988 is to be credited to the employees fund. This would amount to approximately Rs 5 lakh. Thus the total fund of the workers co-operative will be Rs 17.5 lakh. In addition each worker is to contribute Rs 101 for membership of the co-operative.

The employees have decided to accept the minimum bonus as per calculations of the bonus act. The production incentive (ranging from 8-23 per cent) which has been in existence for the last seven years is being waived by workers. The employees have decided to continue with the current wage level for the first three years. Thereafter, an increase of five per cent is projected, subject to achieving the target which has been set for the first three years.

The workers' scheme also proposes certain pre-conditions for the operation of the scheme. It requires the government to register it as a relief undertaking for the first two years of operation. The banks are required to sanction the working capital facility of one crore. Further, the bank should waive the interest due from the date of lock-out to the date of recovering.

The scheme projects a growth of ten per cent in sales for the first five years of operation. As a result, the unit is expected to achieve profit in the first year of operation itself. The estimated profit for the first year will be Rs 22 lakh, and Rs 90 lakh for the second.

The BIFR is expected to decide on the viability of the unit and the extent of sickness based on the report of the auditors of the bank. Subsequently, it is expected that the board will review the schemes filed by various parties to revive the unit. For the three hundred employees of the units, there is a long battle ahead. It all depends on how well the union leads its rank and file in its endeavour to reopen and revive the unit.

CSIR: Reorganisation or Dismantling?

S R Valluri

Unless the grave implications of the recommendations of the Abid Hussain Committee and the Fourth Pay Commission receive careful and timely attention, we may well see the skeleton of the CSIR in about a decade.

Introduction

IT is now a little over two years since the Abid Hussain Committee report on reorganisation of the Council of Scientific and Industrial Research (CSIR) has been submitted. Two years is a long enough time to obtain a perspective viewpoint of the report and implications of that and the Fourth Pay Commission recommendations on CSIR. There is reason to feel that these recommendations will have the consequence, within a decade, of decimating the CSIR.

Important Recommendations of the Committee

Credit should be given where it is due. One section of the report deals with the internal reorganisation of CSIR. These are mostly in the form of cosmetic changes, which cannot really be expected to bring any major improvements in the functioning of the laboratories. They do not even begin to tackle the basic problems that ail the laboratories. The second, and more important part deals with the impact of government policies on 'technology imports' on the functioning of the CSIR. If put into practice they will certainly help improve CSIR laboratories. But these recommendations have much wider ramifications on government policies for obtaining 'self-reliance through liberal import of technologies'. It is doubtful if these recommendations will be implemented, as they imply some constraints on such imports. It is the self-reliance in high-science high-technology areas that will determine whether or not we can enter into the cadre of developed nations. What are being imported now are 'production technologies', which only call for ability to read production drawings, understand the specification of materials and where necessary order the more recent production tools. Such knowledge will not permit an understanding of the underlying scientific, technological and design principles, which alone will lead us along the path of self-reliance. By and large, no serious attempt is being made by the industry to understand these principles, and thus reduce dependence on others. The soft option of the government policy of 'liberal imports of the latest technologies' has made sure of that. When information is sought which can help us unravel these principles, these are more often than not denied by the licensers, with the specious argument that they are not needed for the production of the relevant hardware.

Lack of Corporate R and D as a Technology Interface

In the developed countries, it is the corporate R and D in the industry that generally forms the interface between external R and D organisations such as those of CSIR, which can demonstrate scientific and technological principles up to a certain level, mostly through government funding, and the design bureaus within industry. The latter take up the partially developed technologies that are relevant to them, and bring them to a stage at which the technology development programmes become a direct input to their own design bureaus. Quite frequently the corporate R and D sponsors research in such laboratories and retain their staff as consultants to take advantage of such capability in specific areas, in a relatively less expensive manner. Such a culture is largely missing in the Indian environment because of excessive dependence on imported production technologies. There are therefore major missing links in the chain of absorption of imported technologies and indigenous invention and innovation. There is no easy way to resolve this dilemma without a shift in the government policy. Thus, what basically ails CSIR is, in the main, external to it.

The committee made another important recommendation. This was in regard to transfer of certain CSIR laboratories to some recently created departments of the government. CSIR does not seem to have accepted this recommendation. CSIR should take pride that it had the vision to have anticipated the future requirements of the country, and to have established such institutions, long before the government brought into existence the relevant departments. Perhaps even now it is not too late to review the situation, and transfer these laboratories with appropriate guidelines drawn up to protect their internal autonomy. The fact of the matter is that CSIR headquarters is more in the nature of an administrative headquarters of a government department, and not the technical headquarters which it should be. Transfer of the laboratories to the relevant departments has a better chance of assuring that they can serve the national purpose better, assuming that they will also be headed by scientists/technologists. The natural destinies of these laboratories would appear to lie with some of the new departments of government.

However, many of the committee's other recommendations for internal reorganisation bring to mind the adage 'the more they change, the more they remain the same'. Where the committee made recommendations of substance for internal reorganisation, one cannot question their intentions. They are honourable. But again they recall the familiar adage, 'the way to hell is paved with good intentions'.

Achievements of CSIR

Before we go any further, we have to ask: 'Has CSIR performed so badly since its inception in 1942?' The committee itself pointed out that the CSIR performance is commendable in more ways than one. By all accounts, in a country that was not really familiar with science and its offspring, modern technology, CSIR was primarily instrumental in making people realise that science is not a luxury but a necessary tool for bringing into being a scientific, technological and industrial revolution. In this, it has done well. It is to CSIR's credit that it brought into existence a very wide spectrum of R and D institutions. The activities of such laboratories form the backbone of any developed country, leave alone a developing country such as ours, provided they are directed towards well-defined national purposes.

CSIR has achieved much that is commendable. Nayudamma, former director of the Central Leather Research Institute initiated a programme through CLRI to export processed leather instead of raw leather through which the value added cost of leather exports increased over the years by about Rs 450 crore per year. The committee itself noted that the value of industrial production based on technologies licensed by CSIR is of the order of Rs 500 crore per year, and the annual addition ranges between Rs 50 crore and 100 crore. There are many activities of CSIR laboratories on which no value can be placed. Investments in R and D are looked upon the world over as the overheads the society pays to keep its long-term options open. For an organisation which has an outlay of only about Rs 150-200 crore a year spread over forty laboratories, the contributions of CSIR are therefore nothing to be sneered at.

The committee notes a number of other contributions of CSIR. Its tragedy is that it does not have projects which excite the

OXFAM

OXFAM (INDIA) TRUST

PROJECT OFFICERS

OXFAM is a secular British agency supporting a wide range of development organisations. We are looking for seven committed persons as **Project Officers** who are versatile and keen to work as part of a team. There is one post for a woman or man in each of the following Regional Offices; **Bangalore, Hyderabad, Bhubaneshwar** and **Lucknow** and in addition there is one post for a woman in **Hyderabad** and **Nagpur**.

In respective areas she or he will be responsible for dialogue with organisations supported by OXFAM, for liaison and monitoring. S/he will also maintain contact with other development organisations. Extensive field travel will be required.

S/he should have a relevant qualification and at least 3 years (grassroots) development experience. Accounting skills would be an advantage, especially for the Lucknow post. Probable age range 25-45. Appropriate regional languages are essential in particular for the Bangalore post Tamil, for the Hyderabad post Telugu and/or Kannada and for the Nagpur post, Marathi. All positions require good spoken and written English.

Contracts are for four years. Salary is Rs. 4,092 per month. Additional benefits include HRA, PF, Gratuity, Medical and LTA.

If attracted, POST CV, a 1000 word essay in English or regional language on development problems in the geographical area of your interest and a covering letter outlining why you feel you are the right person for OXFAM.

Shortlisted candidates only will be informed in writing. Last date for receipt of all applications is October 12th. *No phone or personal enquiries please.* Apply to Regional Representatives at:-

- Bangalore :3 Chelvaroya Mudaliar Road, Fraser Town, Bangalore 560 005
- Hyderabad : 38 Paiga Colony, SP Road, Secunderabad 500 003.
- Bhubaneshwar : Plot No. 55A, Kharavelanagar, Unit III, Bhubaneshwar 751 001.
- Nagpur : 19 Gazetted Officers Colony, MLA Hostel Chowk, West High Court Road, Nagpur 440 001.
- Lucknow : 1 La Place, Shahnajaf Road, Hazratganj, Lucknow 226 006.

public imagination, like a Space Launch Vehicle development or reactor development, etc. Basically, it has not been structured for such activities. If it is to undertake such activities, a massive infusion of capital would have to be made. A project like Polar Statellite Launch Vehicle costs about Rs 400-500 crore. When NAL, about a decade ago, tried to push a project for the prototype development of an industrial ground-based 10 mw gas turbine, costing hardly about Rs 10 crore as a pilot plant for parametric studies to be jointly taken up with the industry, it was sent from pillar to post, and the project never saw the light of day. The industry went into foreign collaboration. Apparently, it was what their customers wanted.

Strengths of CSIR

As per conventional wisdom, one notices from recent statistics released by the department of science and technology, CSIR is by far the most powerful 'think-tank' in the country. It has about 1800 doctorates on its staff (roughly one out of every three scientific staff, according to 1986-87 CSIR annual report), as compared to 1512 in ICAR, 646 in DAE, 270 in DST, 261 in DRDO and 244 in DoS. One has to ask what has gone wrong? To do 'productive work', it is not only brains that are needed. They must have well defined tasks, and adequate financial support. Commenting on one of the good laboratories of CSIR, a distinguished Indian scientist said: 'the laboratory is like a beautiful bride, all decked up and nowhere to go'. In spite of its unexcelled capability, it did not have tasks worthy of it. The government will get from S and T departments what they wish to obtain. The committee notes that 'the present scale of operations of the CSIR is sub-optimal'. Even preliminary modern technology development which could form an input to corporate R and D of the industry is expensive and CSIR is starved of funds even if the laboratories were to close most of the projects and concentrate only on a few. A majority of the CSIR laboratories have been set up for scientific or high-science high-technology industrial research. It is therefore not surprising that CSIR laboratories, in the absence of adequate funds, tend to take on basic research which is generally less expensive. In any case, CSIR is obliged to take up scientific research to keep the long-term options of the country open.

Decreasing Funding, Increasing Expectations and Lack of Policy

The committee noted that between the Sixth and Seventh Five-Year Plans, the budget of CSIR, which was roughly comparable to that of defence R and D at the beginning of the Sixth Plan, became about one-tenth the defence R and D budget. One has to ask 'what does the government expect, and to get it, what support has it given to CSIR?'. By all accounts, CSIR seems to have become a step-child of the government to be whipped from time to time for whatever failings, real or imaginary. The committee notes that CSIR has not lived up to public expectations. One wonders whether its programmes have been conscientiously approved by a high level body, and whether the public expectations are commensurate with what the government has provided by way of financial support. About a decade ago, the writer was asked to be a part of a team to defend the budget of CSIR laboratories before the Planning Commission. Each laboratory prepared a fairly exhaustive plan programme for the following year. The discussion with the Planning Commission representatives on the CSIR budget covering forty laboratories was over in less than two hours. No discussion took place on the technical content of the laboratory proposals. They expressed their inability to do so. The discussions ended up in horse-trading—the Planning Commission representatives essentially saying 'we have given so much last year and we will give you 'x' per cent more this year'. It is not known what the present situation is, but if this is what happens at the level of the Planning Commission, which could not even initiate a constructive dialogue of what it expects from CSIR, why blame CSIR? Put plainly, the Planning Commission seems to have abdicated its responsibility to integrate CSIR activities into a national plan through a two-way dialogue on using science and technology as instruments for transforming the technological base of the country, assuming for the moment that they have such a procedure for the other scientific and technical departments. Presumably, if the Planning Commission is unable to initiate such a dialogue, a high level government body will have to define the goals and objectives and tasks for CSIR laboratories and undertake periodic performance audits while assuring appropriate financial support from the Planning Commission.

Cliches as Alternatives to Analyses

The committee uses the phrase 'reinventing the wheel' more than once in the body of the report. Coming from a body which included a sizeable number of scientists and technologists, it is disappointing to note from such cliches the lack of understanding of modern technologies that the committee proposes to cover up. When Bhabha in 1954 obtained a sustained chain reaction in the Apsara reactor, he in fact reinvented what Fermi had done more than a decade earlier in the US. Yet it was an essential first step in establishing the atomic energy programme in the country. Perhaps not many people know that space, as a part of the

learning programme built 100 mm, 300 mm, 560 mm rockets and fired them before they finally went on to build SLV-3 launch vehicle, which in itself resembles one developed earlier elsewhere. Such are the essential first steps that any country has to take, in the quest to build competence. One does not at one shot build a rocket to go to the moon. Is the committee going to argue that if one designs a bullock cart wheel, one can design also a cycle wheel and the landing gear wheels of a big aircraft?

If all that a research laboratory does is to reproduce a hardware or a chemical (unless it happens to be a sponsored project) that is available elsewhere, and does not make any efforts to improve upon it subsequently, the director and his senior colleagues and the research council and its chairman will necessarily be confirming what the committee tried to stress. However, whether a country is able to take the next step or not is dependent on the government policies in such matters. The tragedy at present is that one imported 'latest production technology' is being superseded by the next 'imported production technology' without any noticeable effort to understand the underlying scientific and technological principles to build an improved product, particularly in high technology areas. Japan, for example, started by first copying western products and then its government policies helped it to develop improved products and compete with the western world. The present policy of the government, unless suitably modified, can only result in more and more drain of valuable foreign exchange, without showing any long-term benefits. The scientific community is doing serious injustice to itself by the indiscriminate use of the phrase 'reinventing the wheel'. Use of cliches is a poor substitute to serious thinking in such matters and it will only result in illusion replacing reality in any move towards self-reliance.

Responsibility and Aspects of Tenure

Responsible scientists believe that science and technology have an all pervasive influence on a nation's growth. They realise that they have to contribute in a meaningful manner to this growth, and the nation does not owe them a living unless they live up to such expectations. Unlike administration, where presumably a person can be moved from one job to another, a scientist or a technologist has to bring a life-time commitment to a particular field. Even if he were to be appointed director of a research laboratory, to be effective, he has to give scientific leadership, have a broad understanding of the field in which the laboratory is working, apart from having a general feel for administration. It is in the nature of his responsibilities, that more is demanded from him intellectually than from an administrator in public administration. If a person, when appointed as director, does not live up to his responsibilities based upon well defined criteria, the government certainly should have the right to shift him from that position. But for the committee to stipulate that no person should be a director for more than six years in a particular place is a cure worse than the disease, assuming that the committee identified the directors as the prime culprits for the inadequate performance such as there is in the CSIR laboratories. In those institutions where the head of the department is frequently changed, it is a known fact that there is no commitment to evolve traditions and policies that will endure. The temporary nature of his administrative responsibility effectively prevents it. He has no stake in the future of the institution.

One of the directors of a CSIR laboratory was some time ago invited to head a world famous institution in the US. Had he accepted it, he would have been the fourth in line of succession since its inception in 1929, and the first Indian to be so honoured. A distinguished scientist of such a standing, by virtue of the committee recommendation, cannot be sure of his future at the end of his present six-year tenure. What price patriotism? His continuation till retirement should be by right after a review of his performance. The committee proposes to remove one of the most illustrious persons in the country from the position he is occupying. One wonders, if this is how the committee proposes to strengthen CSIR? For the committee to lay down such a draconian guideline is a cure worse than the disease that ails some of the CSIR laboratories. Such simplistic solutions do not even begin to resolve the basic problems that are faced by CSIR.

Earnings as a Measure of a Laboratory's Contribution to National Growth

The committee took an easy way out of one of the basic problems that CSIR faces by suggesting that its laboratories should earn 30 per cent of their expenditure. One imagines that there are several ways people and institutions can make money. Virtually every CSIR laboratory has been brought into existence to serve a perceived purpose. The stipulation such as the one made by the committee will necessarily drive the director and his colleagues to earn money, no matter how, instead of concentrating on the scientific and industrial research for which the laboratory was brought into existence. Principles of market economy have th place but they should not be indis minately adopted to situations which hardly suited for such an approach. Stri speaking, the committee should h recommended sharpening the charters the laboratories to build in more acco tability among the directors and their c leagues, a more thorough review of five-year plan programmes of the labo tories by responsible bodies, a thorou mid-term and end-of-plan performan audit to ensure that the director and colleagues have lived up to their respo sibilities and a five-year tenure for director and review of his performan before renewal of the contract. Reco mendations such as earning 30 per ce of the expenditure do not even begin analyse the basic problems of CSIR, a can only lead to undertaking routine co mercial tasks, like analysis, to which ev some of the fundamental research labor tories in CSIR are getting attracted.

Size of Laboratory

One cannot help feeling astounded the recommendation that the strength each CSIR laboratory should be gradual reduced to 750. Perhaps the governme should extend this principle as a gener guideline and see that LRDE, GTR ADE, DRDL, etc, in defence R and organisation, VSSC, ISAC, etc, in spac and BARC, etc, in department of atom energy are each pruned to 750! *Prim facie*, such a recommendation unrealistic. The size of a laboratory shoul obviously be related to the responsibiliti that are assigned to it, and not limited b an arbitrary number. In any case, it cann be a game of numbers. For a laborator doing pure theoretical research it can b as small as 75, or can be as much as 750 or more, e g, as in VSSC or BARC. Th counterpart of NAL in UK, the Royal Ai craft Establishment had about 850 people in 1966 and NAL now has abou 1300 people! NAL's responsibilities are n less demanding in its area of responsibilit assigned by the scientific adviser to th minister of defence in 1976. Any chang in size of a laboratory should be base upon a review of its changing respon sibilities and review of its charter. Wha the committee should have done was t discuss the style of administration an management, and their relevance to th charter and the size of the laboratory t live up to its responsibilities, and to brin out the best from the laboratory. It shoul have recommended to the CSIR appoint ment of expert committees to examine thi problem in depth periodically for eac laboratory. The committee has done disservice not only to CSIR but to th scientific community in general by mak

g such an arbitrary recommendation on ze limitation which, if implemented as general principle, will have disastrous onsequences.

Fourth Pay Commission Recommendations

By far the most unfortunate recommen-ation was the one made by the Fourth ay Commission in regard to pay scales pplicable to CSIR (and perhaps other search institutions under the ministry of ience and technology). In this rank and ierarchy ridden society of ours, the status f the director of a CSIR laboratory has een reduced to a level no higher than that f a UGC scale professor of whom there re several hundred in the IITs, leave alone ne universities, as compared to about 40 irectors and perhaps an equal number of cientists of the same rank in CSIR. CSIR cientific staff have to go through rigorous ssessment every five years with a percen-age limitation on the number of staff that an be promoted each time, reaching a aximum salary of Rs 6700, while their ounterparts in the academic system nder the UGC's new provisions can go p to Rs 7300 as a matter of right, barring ecent CSIR provisions for exceptional ases. The salary of the director of a CSIR aboratory is Rs 5900-7300 whereas that of the director of an IIT is Rs 7300-7600. No greater insult can be planned by the government than this wide disparity in pay cales among a common class of profes-sionals. These research laboratories are no ess institutions of national importance han the IITs and they are an integral part of the chain of technology absorption, in-vention and innovation in our efforts owards achieving self-reliance. Any palliative solutions by way of exceptions to the rules in this range of scales can only add insult to injury as they tend to bring discrimination among equals. Such pay anomalies have already started having repercussions on the functioning of some of the CSIR laboratories. The government ought not to make invidious distinctions among people who have similar academic backgrounds and similar responsibilities. The director of a research laboratory and his senior colleagues in CSIR are specifically responsible for the R and D tasks that are assigned to them by their research coun-cils. The directors' responsibilities in CSIR are no less stringent than that of the direc-tors and that of the scientists to their com-parable cadres in the IITs. The concept of academic freedom assures that no such specific responsibility rests on a faculty member in the academic system.

Clearly, this is a problem that has to be tackled at the highest level of the govern-ment to maintain a parity of pay scales among the staff and directors of IITs and those belonging to organisations such as CSIR. Such a parity existed before the Fourth Pay Commission made its recom-mendations. Tackling such problems piece-meal on the basis of political pressures from different ministries/departments which have staff with comparable quali-fications and responsibilities will create more problems than it solves. It would ap-pear that there should be co-ordinated ef-fort among the concerned ministries/departments of the government before such policy decisions are made. It has to be recognised that the research labora-tories form a technology interface between the university/IIT system and the industry. This interface will be weakened very much, if they are treated unfairly or with contempt, causing a serious setback to any efforts towards self-reliance. Government should certainly demand high standards in recruitment and promotions in the research laboratories, but they should not in all fairness, make such distinctions.

Unless something is done to consider the implications of the recommendations of the Abid Hussain Committee and the Fourth Pay Commission, which will have adverse repercussions on the future of CSIR, we may well see the skeleton of the CSIR in about a decade.

Conclusions

If the government wishes to employ CSIR and other R and D laboratories as instruments for building a modern in-dustrial country that is not excessively dependent on others, it is imperative to follow certain basic policies. These poli-cies should have the following ingredients:

- — More clearly specify charters, objec-tives and tasks of laboratories to build accountability on the part of the direc-tors and their senior colleagues;
- — Financial and administrative support commensurate with the charter of responsibilities and assigned S and T tasks;
- — Salary structure for staff and directors in the research laboratories on par with those of the IITs, as they have com-parable responsibilities, and so that they do not encourage migration based purely on monetary considerations;
- — Avoidance of arbitrariness by defining rational guidelines in regard to matters such as size of a laboratory, period of tenure of directors/staff, fixation of budgets, ratio of scientific staff to sup-porting staff, etc; and
- — Consistency in government policies for import of 'technologies' and plans for their absorption, and incentives for in-digenous invention and innovation.

US-Soviet Relations

Non-Reciprocity in Big Power Agreements

James Petras

One of the major consequences of the 'new era' of US-Soviet relations has been to create in Washington a feeling that it can act with impunity against the third world, disregarding the possibility of a Soviet response.

THE most striking aspect of US-Soviet relations in the 1980s is the one-sided concessions ceded by the Soviets and the lack of reciprocity from Washington. The Gorbachev period has been characterised by withdrawal of Soviet influence from major regions of world politics, co-operation with the US in reasserting the latter's influence in conflictual regions and pressure on allies to accommodate US interests, even where the consequences will result in changes inimicable to long-term Soviet security interests. The consequence has been a novel historical moment in two senses: the US—itself a declining power—is able to reassert a global role, even as its capacity and resources to do so is declining. Secondly, the Gorbachev regime is voluntarily relinquishing power and setting in motion forces which can have a lasting effect in undermining Soviet influence in multiple regions of the world. The scale and scope of the shifts in power thus are not mere 'tactical adjustments'—isolated moves or temporary retreats in particularly inhospitable regions, but across-the-board changes in which apparently the Soviet leadership perceives a reduced role for the Soviet regime in world politics and a shift in priority from international political-economic issues toward internal economic-commercial issues.

The result of Soviet changes has been to lessen competition and reduce the options and bargaining power of third world countries. Giving Washington a free hand in the third world might reduce the probability of a Soviet-type regime emerging, but it will not necessarily produce more stable, prosperous and democratic societies. On the contrary, the results could be the return of totalitarian collectivists in Cambodia, fanatical religious fundamentalists in Afghanistan, terrorist clients of South Africa in Angola and Mozambique, and a virulent, destabilising elite political opposition in Nicaragua. Soviet-US summitry may secure Gorbachev a good press and high public opinion ratings, but his policies have not produced any reciprocal concessions from the west that could lead to peace and justice in the troubled areas of the world. On the contrary, each Gorbachevian concession has been interpreted by most US policy-makers, their academic advisors and the mass media, as weaknesses, and have prodded the government to push for further concessions, particularly those undermining political and social movements for national liberation and social transformation. The unspoken allies of this cumulation of western power has been a number of influential pro-western Soviet intellectuals and policy-makers who have taken as their model for Soviet society a utopian and sanitised version of western society and development. Ultimately, the Soviet policy of building bridges to the advanced capitalist countries and burning bridges to the third world can be counterproductive, particularly if it turns out that the Soviets are unable to obtain the economic resources they need from the west and have lost their political and diplomatic influence elsewhere.

The danger of the Gorbachev policy is that it will fall between two stools—giving up support for third world revolutionaries, it may not receive as a *quid pro quo* any concessions from the west.

Balance-Sheet of Non-Reciprocity

A close examination of US-Soviet regional settlements hailed in the west as a new breakthrough in US-Soviet relations reveals a pattern of Soviet concessions without any reciprocal response from the US. In fact, rather than mutual disengagement, Soviet or allied withdrawals have been accompanied by increased involvement of the US. In place of negotiated changes, the unilateral Soviet decisions have encouraged western ideologues to pursue total military victory.

The case of Afghanistan is an outstanding example of Soviet withdrawal and the escalation of US military support to the Afghan tribalists and Islamic fundamentalists. While the Soviets, following the terms of the negotiations, withdrew, the Pakistani regime continues to offer major logistical support and provide military planning to the Afghan opposition. Soviet proposals of a negotiated power sharing settlement have been rejected and Washington has supported Afghan claims for an unconditional military surrender.

In central Europe the Soviets have proposed and are in the process of reducing conventional military and nuclear forces while Washington, Paris and London insist on retaining their numbers while upgrading (modernising) their short and middle range nuclear missiles. No counter offer of substance has been put on the table. The Soviets' unilateral initiatives have merely stimulated demands for deeper cuts. Even more to the point, in western eyes the Soviet arms reduction proposals are not considered part of east-west relations, but rather simply an outgrowth of internal Soviet economic weaknesses. The implication is that since the west does not suffer from these internal debilities, it does not need to follow suit.

In Africa the Soviets have utilised their aid and advisory programme, as well as their leverage on Cuba, to pressure the Angolan government to negotiate with the jointly US and South African backed UNITA insurgency. While Cuban troops withdraw from Angola, Washington and South Africa have continued to arm and support Savimbi. As a result, the number of armed incursions and civilian casualties suffered by the Angolan government have increased since the US-brokered cease-fire. The tactic in both cases has been for Washington to pursue a two-track policy with a double discourse. On the one hand, to orchestrate summit meetings which propose diplomatic-political solutions, thus hoping to disarm its adversaries and project a reasonable conciliatory image to international public opinion. On the other, to sustain military support to clients to seize opportunities to conquer territory, bargaining power or total control.

A similar process is evident in south-east Asia, where the convergence of US, French, Chinese and Soviet policy has forced the Vietnamese to withdraw their troops from Cambodia, opening the door for a possible new take-over by the strongest military force in the opposition, the Khmer Rouge. As an anti-Vietnamese counter, Pol Pot figures in Washington's policies to destabilise the Indo-Chinese peninsula and to regain more leverage in defining Vietnam's terms of re-entry into the regional economic system. Once again, the unilateral withdrawal of Vietnamese troops has been accompanied by increased large-scale advances and assaults by the Khmer Rouge into areas previously defended by the Vietnamese.

While the Soviet Union has moved towards accepting ideological pluralism and the co-existence of different social systems in its former sphere of influence, most notably in its warm support of the clerical pro-capitalist regime in Poland, the US has given no signs that it would modify its relations with socialist Cuba

or even the nationalist market-based Nicaraguan regime. Even further, Washington is moving in Panama to reassert its influence over the Panama Canal, reversing early agreements, by overthrowing the Noriega dictatorship and promoting a civilian client regime. The military manoeuvres and incidents, the threats to kidnap their dissident ex-client are reminiscent of the tactics Brezhnev used to preserve regional domination. Once again, Washington encourages 'openness' in eastern Europe, while practising ideological closeness in the western hemisphere. The logic of this apparent paradox is that Washington is not interested in openness *per se*, but in maximising power, and the former is promoted or discarded, depending on whether it serves those ends. We can expect that once the Soviets pull out, Washington and its western allies will push in. And the same closeness that Washington practises in the Caribbean and Central America will become the rule of the day.

In the Middle East, a similar pattern emerges. While the Soviets do yeoman's work pressuring Iran and Syria to accommodate US interests on the hostages and to become partners to a regional settlement, the US refuses to intervene and pressure the Israelis to release thousands of Palestinian political prisoners held in detention without trial. The Bush politics on the Palestinian-Israeli conflict are based on the notion that the most effective manner to secure additional concessions from the Soviets is to 'stone-wall' it: dig in your heels and keep prodding the Soviets to extract more and more 'compromises' from Arafat, until all that will remain is a Palestinian client regime of Israel. The Soviets have apparently accepted Israeli dominance and have made overtures to reopen diplomatic relations and promote economic ties. It appears that the Gorbachev leadership is content to work within the hegemonic framework of the US and to accept the US leadership in defining its policy objectives.

Asymmetrical changes are also visible in the area of Soviet and US responses to electoral processes in contested areas. While the Soviets allowed the Poles to run their own elections and even accept US funding leading to the victory of a pro-capitalist party, Washington intervenes with massive flows of money, propaganda and organisational resources to subvert the electoral chances of the Sandinistas in Nicaragua. The sustained economic war and shrill propaganda campaign that Washington mounts against Nicaragua belies the notion that the end of the cold war has the same meaning in the south as it has in the east. On contrary, the decline of the cold war means a free hand for the west to reshape the third world political economies according to their needs—a position that Fidel Castro has noted in several of his recent speeches.

All these concessions from the Soviets have led Washington to seek the ultimate one—the dismantling of the socialist economy and its transformation into a capitalist society open to western penetration. In this regard, Washington has welcomed official and unofficial Soviet denunciations not only of Stalin's crimes, but of its revolutionary origins and socio-economic achievements. It has encouraged Soviet academics to accept western versions of the origins of the cold war and the highly coloured version of the 'consumer society'.

While encouraging Soviet self-criticism and promoting 'radical changes' in socialism, Washington and the mass media have excluded the appearance of any sustained structural criticism of the profound decay of all of its major cities, the profound ecology crisis and the polarisation of US society. Incessant 'news' broadcasts focusing on the failures of socialism and the wonders of the free market have become the propaganda tool to reinforce the concentration of power in the US and its extension abroad.

Conclusion

One of the major consequences of the unequal outcomes in US-Soviet negotiations has been to create in Washington a feeling that it can act with impunity against the third world, disregarding the effects of a Soviet counter-response. The era of the 'free hand' opens the door to brazen violations of sovereignty. While US-Soviet agreements may end the cold war, they seem to encourage Washington to pursue hot wars through surrogates in the third world.

It is a one-sided 'new era'. The interpretation in Washington is that Soviet concessions are signs of weakness and that the US should press its advantages, escalate its propaganda campaigns, deepen its ties with pro-capitalist forces like Solidarity and proceed to total victory, i e, the restoration of capitalist hegemony in eastern Europe. The eastern intellectuals play a crucial transitional role: by discrediting public enterprises and conveniently refraining from examining the negative experiences of the free market (in Latin America, Thatcherite England and in the cities of the US), they prepare the ground for the future subordination of their nations to the unfree markets of the international banks and multinationals, a corporate controlled free media, and a highly polarised pluralist class society forced into unending debt payments to the west. The end result of non-reciprocal reforms and concessions thus could reduce the chances of nuclear war, but it is hardly likely to be a more just and peaceful world.

The Left and Feminism

Kumari Jayawardena
Govind Kelkar

The spectre of western feminism has been used by many left party leaders and left ideologues to attack local feminists as bourgeois, westernised and influenced by 'white' feminism. In such campaigns against feminism, the left often finds itself in strange company along with the Ayatollahs and other fundamentalists, who whip up xenophobia about western 'decadence'.

AS a preamble it is necessary to ask ourselves why we are discussing the question of the left in south Asia and feminism. Some may ask why even bother about the left because the left, whether in socialist countries or in the states of India with communist ministers, does not have a brilliant record on women's issues; or because the left is not an electoral force and has been soundly defeated at the polls in some countries of the region; or because the left, steeped in the jargon and issues of an earlier period, has failed to adapt itself to new movements based on gender, environment and other issues. We are struck by the left amnesia where women are concerned and, hence, their failure to insert the woman question into existing work/revolutionary practice and to transform it.

It is therefore necessary to state that we are discussing the left because we are not merely feminists but socialist feminists, and that our vision of 'a total transformation of society', is not a change from patriarchy to matriarchy, but a transformation to a socialist society where all forms of exploitation and oppression have ceased. Of course, we may all have different visions of what constitutes socialism, or what a feminist socialist society would be. But that is another topic. For the present we feel that the women's issue is part of the democratic struggle which is central to left parties and groups, and which is a struggle they have theorised about for decades. We also feel that a movement calling itself socialist, and not taking up the oppression of women as a question at the core of democracy and socialism, is hardly living up to socialist ideals. Evidently, a correct analysis of feminism cannot be provided by the left unless the left itself is transformed through an attempt to understand and come to terms with patriarchy in its historical setting and its complex and problematic relationship with dominant relations of production.

Arguments against Feminism

In south Asia, the left parties, from their inception, have mobilised women of all classes in the freedom struggle, in trade union activity, in peasant agitation, student and youth movements. There have also been women revolutionaries who have played key roles in organising workers and peasants, participating in some of the historic, anti-imperialist and anti-capitalist struggles, such as the Chittagong Armoury raid, the Telengana and Tebagha uprisings, armed peasant uprisings or the 'Naxalite' movements and numerous militant trade union actions. The left parties in India for example, have also led protests against rape and harassment of peasant women by upper caste landlords, and have been active in denouncing *sati* and fundamentalist laws harmful to women.

The left has also been involved in annual celebrations of women's day, sometimes on a joint platform with feminists and also in the celebration of the U N year and decade of women. A conference backed by the Communist Party of India (Marxist) was held in 1975 in Trivandrum, Kerala on the women's issue and on this occasion, the *Social Scientist* (journal supported by the CPI (M)) brought out a special issue on women. It is interesting to note that the articles in this issue included one by the party leader E M S Namboodiripad, followed by articles by Carol Brown, an American feminist, on 'Patriarchal Capitalism', and Gail Omvedt on 'Rural Origins of Women's Liberation in India'. The various left parties of south Asia have also organised women on international issues such as the campaign to free notable women revolutionaries and freedom fighters such as Angela Davis.

However, the women's organisations of the CPI or of the CPI(M) in India have not used words, or concepts, like feminism and patriarchy. During a discussion with a leading member of the National Federation of Indian Women, she explicitly stated that position:

> We are not a feminist organisation, we ar[e] not anti-men. We are not the only ones wh[o] are exploited, Harijan men are no less ex[-]ploited, of course, their woman are doubl[y] exploited. Since 1971 in the CPI, the tw[o] women-specific points of debate have been 1) how to draw/attract, more women to ou[r] struggle/movement, and 2) how to chang[e] the attitudes of male comrades to encourag[e] women to join the political struggle/the par[-]ty. One has to be a good, sympathetic hus[-]band to allow woman to join the struggl[e] (Govind Kelkar's interview with Viml[a] Farookhi).

While there are some ideologica[l] differences among the left parties/ organisations on national and in[-]ternational issues, they have areas o[f] agreement on feminism. For instance CPI(M) document, *Feminists and Women's Movement* (undated) stated that feminists are the urban middle class women having a desire to divide the people, particularly the working class; they would like "women of all classes should come together to fight against men", (p3); women's organisations, particularly autonomous groups, are responsible for keeping women out of politics and would not like them to join struggle against the state (pp 16-17). According to the document, it is important to realise that the subjugation of women is part of the class society and "when the property relations are abolished, conditions for women's equality as in a socialist society are automatically created" (p 28). At the same time, the document makes a contradictory but candid observation that "the 'patriarchy' or male dominance which does exist in the political parties, trade unions, etc, is to be consciously fought by the leadership of the party and trade unions and also by the women's organisations" (p 10).

Similar arguments against feminism, though perhaps not so crudely and confusedly presented, were stated in another document entitled *The Material Basis for Women's Liberation*. The three writers were in the political range of CPI to CPI(ML). Commenting on the "heinous crimes" of dowry and dowry deaths and how the question is to be taken up from the point of view of a movement for the emancipation of women, the document states:

> The question of dowry is intimately related to the ownership of property; and it exists in a situation where without a hold on private property men cannot hope to gain any self respect and economic status. Given that in our society acquisition of wealth by *whatever means* is given economic and political recognition by the rulers and the state, there is a general degeneration of work and human values in relation to this institution of private

property. Bride-burning is just one and of this spectrum of 'whatever means' and the women's movement has to address itself to whatever in our social order and the problem related to the acquisition of property and social status (p 5).

The document concludes on a prescriptive note to the feminists not to divide the working class families along sex lines. "Hence any women's movement pitted against the oppression of family on women must first learn to fight against the property relations in that society" (p 14) These crude statements and shoddy analysis of feminism in India did not permit even a relationship to be posed between class and women's subordination, or the question of "the domestic enslavement of women", "the first class oppression of the female by the male" which are so evident in Marxian analysis and explicitly stated in Engels' *Origin of the Family, Private Property and the State*. The left has failed to make a deeper analysis of Engels' thesis on the family or the woman question.

Feminist anthropologists and social scientists like Eleanor Leacock (1971), Karen Sacks (1975), Gayle Rubin (1975), Christine Delphy (1986) and Gerda Lerner (1986) have reclaimed Engels' work for its attempt to produce a historically specific account of sexual inequality to counter the universalistic assumption about women's subordination. Their anthropological works went further than Engels to say, first, that female subordination and appropriation of women's labour preceded and played a crucial role in establishing the basis for the emergence of private property and the state (and not the other way around as Engels had assumed). Second, marriage is not just a matter between individuals or at most between the conniving parents but a relationship between larger groups, such as households, families and kinship groups and depends to a large extent on the relationship of these groups to property. Third, they have questioned a Marxist criteria in attributing to women the class of their husbands, which is wrong and un-Marxist too. While it is true that upper class and caste women tend to share some of the privileges with their men, they nevertheless have no direct acces to and control of the means of production (land, property, technology). Women, therefore, have only a derived status or class-caste membership which is not equivalent to that of the male members. Besides, patriarchal oppression, the sexual subordination, the familial duties in the form of child-rearing and care of the family members runs across through class-caste situations which tends to unite them with women of the peasant, working class and reinforces their alienation.

Those left parties involved in parliamentary politics, however, have been mainly active in mobilising women voters for electoral politics at local and national level and in trade union activity. Equal rights of participation in *class* struggles have never been in doubt, but the question of 'women's liberation' as opposed to 'workers' liberation' or 'national liberation' has been subsumed under 'class struggle'. It was argued that, with the overthrow of capitalism and private property, women would be liberated.

Nevertheless, the left being dogmatic, and glued to the 'books' has ironically also had to accept and quote the classic texts of Marxism on women. All the peoples' publishing houses in the region carry both English and local language translations of Engels' *The Family, Private Property and the State* and Lenin's collected essays on *The Emancipation of Women*; and the Maoists, if and when they discuss the women's issue, have inevitably to quote from the classic text of Mao on the four ropes binding Chinese women, the fourth rope being the authority of the husband.

Organisationally, the left has always had women's associations, clearly linked, controlled and organised by the party, with little or no autonomy. There has been a resistance in the left to autonomous women's organisations. For example, when women of two left parties came together in 1947 to form an autonomous women's group in Sri Lanka, in spite of their successes in raising issues concerning working women, the parties which had never been too happy at this show of unity among women, ordered its dissolution after a year.

It is also probably true that neither the left leaders nor the women in left parties have seriously debated the woman question. They have often made self-criticism on right or left deviations, on their failures in mobilising minorities, intellectuals and other groups, but criticism of the failure to highlight women's oppression has not been made. Yet there is no doubt that party leadership is involved at the highest level when decisions are made to attack feminists and women's studies. In Sri Lanka, the secretary of a small Trotskyist party was taken to task by the party for publishing an offensive article denouncing women's day; the article not only attacked feminists as middle-class 'canaries' who think that men should be scraping coconut in the kitchen, but also claimed that too much fuss was being made about violence against women which was only fun and games between husband and wife.

Uneasy Relationship with Feminist Movement

The left in south Asia since the 1970s has an uneasy relationship with autonomous feminist movements which arose in that period. On the one hand, these movements included women socialists and Marxists, and on many of the issues and struggles of feminists, the left was in agreement. But on the other hand, the groups were not controlled by the party, and many of the demands were thought of as extremist or subversive.

Autonomous groups are further criticised by the left as 'apolitical', having a narrow world-view, not being interested in seeking state power. What is important is to recognise that like many other social movements, the women's movement too, is critical of the state, and asks greater self-determination for itself or autonomy from state itself. By no means does this mean that feminism or women's movement is apolitical, not interested in transformation of the character and nature of the state. However, a large section of feminist organisations tend to the view that the very notion of state or political party power for them would negate most of their grassroots aims and essence. Importantly, feminism is indeed anti-systemic in the sense that it challenges the basis of the system and tries to protect its members physically and emotionally from familial and extra-familial violence as well as other vagaries of political economy in south Asia. In an analysis of women's movements in the countries of south Asia, it was repeatedly pointed out that the stands taken by feminists in theory and action, have taken into account class, caste and ethnic issues, for example:

— South Asian feminist movements have been active in raising issues of women's subordination, economic exploitation and social oppression, including restoration of democracy, against militarisation and extreme brutalisation of society, e g, gang rapes of masses of women, parading of naked women.

— They have been active against growing communalisation of society, religious fundamentalism, Hindu and Buddhist chauvinism, Islamisation and ethnic/nationality violence.

— They have struggled against the growth of anti-people science and technologies, green revolution and white revolution technologies, destruction of forests and other natural resources and against attempts to reduce the status of women, in agitations against bonded labour.

— Feminists, individually and collectively, have mobilised people (both women and men) against discriminations against

women, the absence of women in political process, agitation for equal pay and equal opportunities, population control policies, against sexism in the media and the text-books and crimes against woman (e g, dowry murder, sati, etc).

Feminist theory has made efforts to deconstruct family as a natural unit and to reconstruct it as a social unit with an ideology, an institutional nexus of social relationships and cultural forms/ meanings. Besides, feminist organisations have demonstrated more participatory, democratic and mutual support, rather than hierarchical soical relations.

The feminist critique of the family and the open-ended discussion on sexuality and morality initiated by some feminist groups led to the widest controversies. Feminists were depicted as ultra-left, petty-bourgeois, bourgeois, anarchist or worse. The 'worse' was that they were foreign agents, dependent on foreign money, in the pay of foreign governments. In south Asia, sections of the mass media have been particularly prone to use such arguments against the women's movement. In Sri Lanka for example, March 8 has been the occasion each year for attacks on feminists, the most recent example being an editorial entitled 'Female Chauvinism' in the *Island* of March 8, 1989 where stale old stories of western women burning their bras were repeated once again. When such views are put forward, left intellectuals do not come to the defence of the women's movement, leading us to conclude that on the issue of feminism, the right and the left are more or less in agreement. Here one may add that armed groups of youth, defined as 'ultra-left' who are active in the region, along with ultra-nationalist armed groups, have shown no greater awareness on the 'woman question' and some of them have, in fact, been conspicuous for their orthodox and puritan approaches to women, frequently pronouncing on women's 'duties' and giving orders on their behaviour and dress. The left organisations in Bangladesh and India, for instance, have repeatedly demonstrated and urged the state, employers and the public administration that they should enable working women to fulfil their roles as 'mothers' and 'wives' in the family. No effort was made to see any connection between the struggle against patriarchy and the struggle against capitalism and imperialism.

Many of us have also had personal experience of male chauvinism among left intellectuals and scholars of the region—the experience often being that the greater the 'eminence' of the 'important male' the worse his position of feminism. The level of ignorance on the women's issue is a cause for concern; few left intellectuals have bothered to read or understand the theory and practice of feminism, choosing, like their 'bourgeois' colleagues, to dismiss the movement as a western fad of upper-class women which has no relevance to the local situation. A typical example was the recent review of *Women of Pakistan* (by Fareeda Shaheed and Kanwar Mumtaz) made by Babar Ali, a Pakistani left intellectual, who stated that the book was "the westernised affluent bourgeois Pakistani women's story of 'struggle' for essentially westernised bourgeois women's rights".

Today we have to ask why there is such a reluctance to support the struggle for women's liberation among left intellectuals. One may argue that all males, including those of the left, do not want to lose the benefits of patriarchy in the home and in society. It may also be that there is a high degree of conservatism within the left—perhaps due to the largely petty-bourgeois origin of many south Asian left party leaders and cadres.

The underdevelopment of political theory within the south Asian left may also be seen as a major factor impeding a correct understanding of the women question. The dogmatic approach preferred by many left political leaders and intellectuals often means that nothing is 'correct' if not supported by a relevant quote from Marx or Lenin, Stalin or Mao, Castro or Ortega, as the case may be. This of course leaves little or no room for questioning: nor does it encourage discussion on those new areas of philosophy and political theory opened up, not only by the feminist movement but also by the ecology movement.

The spectre of western feminism has been used by many left party leaders and left ideologues to attack local feminists as bourgeois, westernised and influenced by 'white' feminism. It is alleged that in raising feminist issues in south Asia, feminists are causing disruption in the family, dividing the working people along gender lines, and disrupting the party. In such campaigns against feminism, the left often finds itself in strange company along with the Ayatollahs and other fundamentalists, who whip up xenophobia about western 'decadence'. Thus internationalism, which should be an essential element of left thinking, is replaced by narrow nationalism.

However, it would be wrong and un-wise to portray the left movements/ organisations that they have failed to take up women's issues. In the recent years, there has been some perceptible change in shaking off the patriarchal bias in the treatment of women members and women's organisations, though th still don't call them feminists or use t word 'feminism'. A majority of l organisations (in south Asian regio have set up women's wings/cells deal with the women-specific issu They have organised March 8 me ings, demonstrations against wi burning and other forms of violen against women, have helped femini groups to organise conferences on issu like familial violence, patriarchy and so c (example Patna, Jharkhand, Assam Na Mukti Sanstha). However, in these mobil sations they still tend to see women in th wife and mother roles, essentially havin a patriarchal attitude. A few of th CPI(ML) activists have written a mil critique of Engels' view on the family an private property. Yet they did not go fa enough to see the significance of hous work, the gender construction, women sexuality, and other issues raised b feminists. Nevertheless, it was also notic ed that some of those who became voca and active on women- specific = feminis issues, were expelled from their parties

WELCOME NOTE OF CRITICISM AND SELF-CRITICISM

A welcome note of criticism and self criticism of the Indian left on the woman question appeared for the first time or March 8, 1989 in *Mass Line* (a CPI(ML party organ) stating:

> Although women were in the forefront in various struggles and movements erupting across the country, this circumstance was never made use of either to politically develop cadres from among them or to develop a mass movement against the oppression of women. Instead, backward ideas of male supremacy and the like were peacefully coexisted with and even fostered by the party, whose actual role in the struggle against women's oppression was far from positive. In the name of the centrality of class struggle the leadership stubbornly brushed aside the question of women's oppression. The revisionist leaders were thus in fact guilty not just of mechanical thinking but of kowtowing to orthodoxy, of downright rightism. No wonder the lofty goal of the working class movement—the bringing into being of classless, oppressionless society grew more and more distant.

However, such 'theoretical' statements are seen as inadequate by feminists/ women's movements in India, as they have failed to locate the sexual division of the social relations under which women work within the house and outside and the social relations generated by the child-bearing role of women is structured in such a way that relations between men and women are relations of domination and subordination.

The left has given little attention to the

ssue of land rights for women and to rectify the existing agricultural wage system where women wage workers are lower paid than men. Moreover, there is no explanation given for the specific political and ideological oppression of women, the system of male control in the family and outside, the male inheritance of productive resources in connection with either land or factory production and the economic subordination of women in wage labour. Like the sexual division of labour, the sexual division of private property is regarded as natural and therefore not to be questioned. A woman's relation to productive property/land is always mediated through her relation to her husband, father, or brother, precisely her existence in the household where her husband is the head or in the natal family where the father or brother plays such a role.

In view of the above, what is then the status of 'unconscious' feminism? Can we call some women feminists who would reject such a description of themselves? Or, can we ascribe to them a feminism of which they are unaware? Let us see what some of the poor peasant women of Bihar have to say about their marginality in politics. These women critically questioned the sexual division of work in politics and the present-day responsibility of the 'wholetimers' (fully engaged in political work) in maintaining themselves and putting the entire burden of the household on the wife. They grudged that their husbands did politics at the expense of women and as a corrective measure suggested that a wholetimer should (1) share equally and fully the responsibilities and burden of household work and child care; (2) participate in production in order to support himself as well as the dependents of the family; and (3) participate in political work and make full efforts to help women in the family, e g, wife, sister, mother, daughter to actively participate in mass organisation/ political work. Seemingly, only then would it be possible for women to accept ungrudgingly and support the husbands' mass, political work and for the women themselves to participate in the political process of social transformation. Women spoke in the vein of leading Marxist leaders, like Rosa Luxemburg and Mao Zedong, and suggested a sharing and responsible role for male political workers.

Feminism is thus related to the fundamental restructuring of society with a women-centred approach, something that challenges the basic structures of oppression and inequality. However, organisations, including most of all women's organisations, have not yet conceptualised or defined for themselves the specificities of alternate processes/socio-political system or what they should be doing in order to bring about such a change. Accepting the mode of a protracted and organised struggle and realising well that their struggle is the hardest, women activists and researchers have often betrayed anxiety about a wide base of support and identification with peasant and working class women. That, women engaged in the struggle for feminist liberation did need more conceptualising and knowledge of problems of the movement, of history, as well as investigative research and interaction with each other to build up strength through solidarity action, i e, advocacy of their rights and providing support to each other in the women's groups. This has to be expanded regionally and internationally too. More important, women's solidarity action has to be extended to all progressive groups of women and men who question patriarchy and/or are connected with class organisations or other popular organisations.

Alternatives

1 The question of taking feminist issues into mass movements which include left and other organisations.

2 Supporting democratic, progressive women's organisations/groups and their struggles.

3 Coming together with other groups on issues of human rights, peace, ecology, against communal violence, anti-fundamentalist agitations, and for worker, peasant actions.

4 Taking the issues of feminism to woman students, the women's sections of political parties and women's political groups.

5 Raising men's consciousness that the women's struggle and feminism are part of democratic and socialist struggles.

6 Raising the issue of political activism and the need to activate the families of political workers in sharing of political work and household responsibility.

7 Recognition by feminists that left is an ally in the process of social change, based on an awareness of the importance of a class analysis.

8 Recognition of sectarianism and insularity by both feminists and leftists and to continue the dialogue on differences which may exist and on issues which are crucial to both feminists and leftists.

Banking and Economic Development

T K Velayudham

Banking and Economic Development published by the Indian Institute of Bankers, Bombay, 1989; pp 160 + vii, price not mentioned.

THE Indian Institute of Bankers must be congratulated for hosting, for the first time in a third world country, the International Banking Summer School, which is the 41st since its inception in 1948. For those in the banking world, the International Banking Summer School (IBSS) represents a high-level international forum for discussion of banking and financial problems by eminent practising bankers and economists. For this reason, the themes selected for discussion attract considerable attention and, over the four decades, the themes selected have been wide-ranging in scope and variety. The 41st IBSS held in New Delhi from September 17 to September 30, 1988 took as its theme 'Banking and Economic Development' and the papers presented have been brought together in the publication under review.

The publication contains nine papers and three case studies followed by group discussion syllabuses on five subjects. The nine papers presented at the IBSS could be classified into six subject groups and these are: (i) central banking and economic development; (ii) commercial banking in the context of changing global scenario and covering the Indian and Japanese experience; (iii) the international setting, covering the need for reform of the international monetary system and also international borrowing and lending for economic development; (iv) capital markets and economic development; (v) monetary policy; and (vi) competition and regulation in banking for development. This subject grouping is followed for the purposes of this review.

A general comment on the theme selected for the IBSS seems appropriate. Banking in relation to economic development is a theme which has been discussed in its various aspects and at several forums (national and international) for the past two decades or so. Reserve Bank of India itself organised in February 1970 an international seminar on "Banking and Development" and brought out a report. The subjects discussed at the RBI seminar dealt with quite a few of the aspects of banking in the context of development. No doubt, the IBSS has dealt with banking in relation to more recent developments, both national and global, in certain important areas like international monetary reform, international borrowing and lending, capital markets, competition and deregulation, etc. Yet the subject of banking and economic development seems a little hackneyed for an international seminar.

Central Banking and Economic Development

The paper on "Central Banking and Economic Development—Indian Experience" presented by a deputy governor of the Reserve Bank of India quotes the First Plan document to indicate that the role of the central bank in the process of planned development was recognised at an early stage and goes on to bring out the various aspects of the developmental role of the Reserve Bank of India (RBI) such as deepening and widening the financial system, promotion of institutionalisation of savings and investment, covering functional and geographical gaps in banking, creation of new institutions like Discount and Finance House of India, National Housing Bank, etc. Turning to the regulatory aspects, the paper refers to the administered interest rate structure and its impact on instruments of credit control; monetary targeting of a sort; allocation of credit because of the imperfections of the credit market; the RBI's concern for relative price stability; and the changing nature of the central bank's functions over time, both in content and significance. By way of peroration, the paper refers to the promotional and regulatory role of central banks in the environment of developing countries; the occasional conflict between the two roles; their long run compatibility and monetary policy as a countervailing force in the context of expanding development expenditures.

All this is good so far as it goes. In fact, the promotional as well as the regulatory role of RBI has been discussed since the RBI took upon itself the pioneering experiment of playing both the roles and this had invariably been the theme of the speeches of governors, deputy governors and others till the beginning of seventies. One would, therefore, be justified in expecting from RBI a paper containing the *lessons* of the Indian experience spread over almost a period of forty years. This is where the RBI paper does not do justice to the subject. The paper has just recounted the various measures taken by the RBI to promote development and also to regulate the supply of money and credit in the interests of price stability. No attempt has been made in the paper to *evaluate the Indian experience* of the central bank's role in economic development. There are a number of questions which the paper could have attempted to answer. For instance, how did RBI play its developmental role within the traditional framework of central banking provided by the Reserve Bank of India Ac[t] 1935? Was its promotional role direct [or] indirect? If it is indirect, what is it th[at] prevented RBI from assuming directly th[e] promotional role? Similarly, more than itsel[f] participating in the promotional role, ha[s] not the RBI guided and induced commercia[l] banks to play their role in development—which is unique and in contrast to the traditional relationship between central bank[s] and commercial banks? Again, why were th[e] institutions created for promoting development (IDBI, UTI, Agricultural Refinanc[e] and Development Corporation whic[h] became NABARD) delinked from RBI? What are the reasons? Or does the delinking support the 'hive-off' thesis develope[d] by Sayers in his Cairo lectures? Besides eve[n] without an expansionary fiscal policy, ha[s] not the shift in emphasis from economi[c] development to social justice rendered th[e] regulatory role of RBI less and less effective, to the point of ceasing to be a countervailing force? Finally, given the situation o[f] floating exchange rates, what has been th[e] experience of RBI in protecting the value o[f] the currency, as the country is dependent o[n] exports and capital imports so necessary fo[r] development? If only the RBI paper had attempted to throw light on these questions, it would have enhanced the value of the Indian experience considerably for a gathering of international experts who regard the RBI's experience as a model.

Commercial Banking

There are three papers falling in this group. The first, by John G Quinton, chairman, Barclays Bank, deals with commercial banking in the context of the changing global scenario. Quinton examines in his paper those major elements of change which affect the way in which banks (multinational?) conduct their business and also how banks would need not only to face competition but also to capitalise upon the changes so that the banks may continue to grow and prosper. According to Quinton, the Bretton Woods system set the stage for an environment of unparalleled stability in the financial markets in the post-war period which was generally characterised by fixed exchange rates, low inflation, low real interest rates, high growth and very little competition within the banking system. This cosy existence was, however, disrupted by several factors such as the breakdown of the fixed exchange rate system, the oil shocks first in 1973 and again in 1979, followed by inflation and higher levels of interest rates—from the effects of which the third world countries, dependent upon developed countries, could not escape. While these events were a traumatic experience for many countries, the banking profession seized upon the opportunities provided by the disrupting events and the new environment emerging

therefrom. Thus, for instance, the high inflation of the 70s resulted in a move away from fixed rate finance to variable rate financing of many kinds. Similarly, the volatility of exchange rates and interest rates speeded up the growth of markets for such products as forward exchange cover, swaps, traded options, futures, and the like. Besides, the huge imbalances between oil exporting and importing economies enabled the banks to act as intermediaries recycling OPEC surpluses almost to the point of reckless lending.

The main factors which, according to Quinton, are shaping the current financial environment are: (a) globalisation as reflected in the industrial world being dominated increasingly by a small number of multinational corporations; (b) massive investment in information technology arising from the paramount need for immediate and accurate information; (c) deregulation and internationalisation leading to the entry of new players and increased competition; (d) disintermediation as indicated by borrowers and lenders bypassing the banks; and (e) securitisation. In the opinion of Quinton, the most important of these is the technological change because information about money has become almost as important as money; besides, changing technology is also altering the delivery mechanisms for financial services, while, at the same time, it also means that pricing anomalies between markets are short-lived. To top it all is the fact that bank customers have become more discerning in their tastes and that it is no longer sufficient for the banks to be product-led; they need to be market-led. These trends would continue and would have an impact on the business of banks.

By way of conclusion, Quinton asks the questions as to what the way forward is and how would the banks capitalise on these changes which present not only opportunities but threats as well. Quinton believes that a bank must either have global aspirations, i e, it should view its business area as a worldwide integrated market, or alternatively be a niche player. The development of a global market will accelerate deregulation of domestic markets, will increase mergers and acquisitions of banks to achieve larger market coverage and will necessitate restructuring of bank managements.

While Quinton's paper provides many insights into the changing global scenario for banking, it is silent on some important elements in the situation. The first is the unresolved debt problem and given this situation, will the banks succeed in increasing their global operations? According to a study published by the IMF, lending to developing countries (by international banks) has declined since the debt crisis, to reach a low level in 1986-87 while during the same period there was a net increase in lending to industrial countries, which does not seem to be a healthy trend from the view-point of the international flow funds. Besides, quite a few of the international banks suffered capital erosion due to provision of huge loan loss reserves. It should also be noted that the operations of international banks have grown far ahead of the scope for effective regulation and supervision either within the markets or at the level of international institutions and governments. In the absence of any safety-net, would international lending operations by banks remain stable or would they show steady growth? What could be done to ensure this? These points deserve attention.

Turning to the second paper "Banking and Economic Development—Japanese Experience" presented by Shijuro Ogata, it brings out the important role played by the Japanese banks in the periods of high growth and slow growth and the relevance of Japanese experience to other (developing) economies. The role of banks in economic development in the high growth period, i e, since the end of the war to about 1970, has to be viewed in the context of Japanese economic policies the major aim of which was to accord the highest priority to the promotion of exports and private productive investment. This was because Japan, nearly totally destroyed by war, had to start as a small island country without much natural resources and capital. It was essential to import raw materials and food stuffs and export processed products to cover the import bills; and generally speaking, the balance of payments discipline chosen by Japan worked well, because economic policies were geared to high growth with price stability and manageable balance of payments position, through effective mobilisation of domestic savings within the framework of a balanced budget, prudent monetary policy, tax incentives for savings and investment and protectionist industrial policies. During this period of high growth, financial conditions in Japan displayed certain special characteristics. These are: (a) indirect finance was the major approach; financial requirements were met mostly by bank credit and not so much by issue of securities by corporations because of an underdeveloped capital market, meagre private savings mostly absorbed by banks and postal savings schemes and separation of banking business and securities business; (b) presence of different groups of banks called ordinary banks, long-term credit banks and specialised banks to avoid mismatching of funding and lending; (c) regulated interest rates; (d) establishment of government financial institutions; (e) permitting the inflow of foreign capital mainly in the form of short-term trade credits for banks and medium-term for Japanese industries; and (f) overlending by banks.

During the second period, i e, the slow growth period from around 1970, the financial conditions were affected by the changes in the real economy of Japan. The most important factors which brought about changes in the real economy were the slow down of economic growth, particularly after the dramatic rise in oil prices and the change in Japan's external position to that of a surplus country. The impact of these on the financial conditions were: (a) abandoning balanced budget concept and spending more than the revenue by issuing large amounts of securities which led to the development of the secondary market; (b) slow rise in the household sector's wages and incomes leading to diversification of financial asset-holdings in favour of higher earning assets; (c) improved financial position of the corporate sector, resulting in increased internal reserves; (d) liberalisation of exchange control due to surpluses on external account; and (e) flexible or accommodating monetary policy following the sharp rise in the Japanese yen to mitigate the adverse impact of the yen's appreciation. In these conditions, banks started expanding their international operations, as domestic corporate demand for bank credit was modest. Similarly, the trend towards securitisation became more pronounced. Deregulation and easy money conditions tended to squeeze bank profit margins. The important difference in the role played by Japanese banks during the period up to 1970 and after 1970s is that in the former period the banks played a leading role in development, while in the subsequent period their role has been passive in that they no longer initiated moves to create new economic situations.

The question is: how relevant is the Japanese experience to other economies, particularly developing countries? In two respects the Japanese experience is unique for that country and for that particular period. The first is that Japan started its post-war reconstruction and development when the world economy and world trade were growing with stable exchange rates, trade preferences and with the support of the strong key-currency country, viz, the US. Second, Japan was able to isolate, to a great extent, its economy and its economic management from outside influences. Nevertheless, some aspects of Japanese experience seem applicable to other countries. These are briefly: (a) political and social stability; (b) high rates of saving of the household sector which primarily financed economic development (not foreign capital nor government's deficit spending); (c) macro-economic policies which aimed at balancing growth and stability; and (d) financial schemes and banking practices which took into account industrial and social policy considerations. Two important factors which enabled the banks to play their role in development and *which are not referred to* in Ogata's paper are: (a) the deliberate undervaluation of the yen which made possible export-led growth of Japan; and (b) sound co-ordination between monetary and fiscal policies which created a stable price situation for savings and export competitiveness.

The third paper, "Commercial Banking: Lessons from Indian Experience", presented by the then chairman, State Bank of India, seeks to focus attention primarily on the experience of commercial banks in the post-

nationalisation phase. After giving a brief overview of the changes in the banking scenario, the paper discusses the most striking aspects of the impact of nationalisation, namely, shifts in the pattern of deployment of credit, the pattern of administrative intervention and integration with poverty alteration programme, and goes on to highlight the problems of expansion. Dealing with the first striking feature, i e, shifts in the pattern of deployment of credit, the paper refers to the pre-nationalisation position of bank credit which was characterised by a very skewed distribution, concentration within a narrow range arising from low capital base of commercial banks controlled by a few persons and strengthened through interlocking of directorships and the corporate borrowers. What impelled the authorities to curb this concentration and strive for redeployment of credit during the mid-sixties was the demand from the agricultural sector, which became more and more pronounced with the introduction of high-yielding varieties and adoption of capital-intensive agricultural technology, in the wake of two successive droughts. Following nationalisation, there has been a marked shift in the sectoral deployment of credit in favour of agriculture.

How has this change come about? By way of answer to this question, Ghosh makes a neat logical presentation of administrative intervention. After referring to the inadequacies of the market as an allocative mechanism, Ghosh focuses attention on the key elements in administrative intervention and these are: (a) direct exhortation by authorities, government as well as RBI, and through stipulation of targets for lending to those sectors which were hitherto neglected; (b) branch licensing policy which resulted in rapid increase in branch network in rural and semi-urban sectors; (c) indirect inducement through availability of refinance; (d) a scheme of insurance guaranteeing a part of the losses sustained by banks in lending in unknown areas: (e) introduction of differential structure of interest rates linked to income levels and types of lending; and (f) preparation of credit plans for each district by the lead bank whose responsibility it is to co-ordinate the activities of different credit institutions and local development agencies for drawing up the plans and implementing them. All these measures led to a quantum jump in advances to the sectors which, prior to nationalisation, were outside the banking system. However, the realisation that a major part of finance was going to the more affluent farmers necessitated the reorientation of banking policy to support the poverty alleviation programmes for the rural poor. Besides, the banking system brought about changes in the direction of credit flows through a credit plan at the macro-level and through stepping up of credit flow to the industrially backward states.

The achievement of the Indian banking system has been unique in that it has achieved remarkable diversification and expansion within a short period. However, this brought in its wake a number of problems such as: complexities of servicing diverse sectors, substantial administrative and supervising costs connected with poverty alleviation programmes, nursing sick units, personnel recruitment and training, operating on thin margins which are not adequate for maintaining viability. While the paper is a logical account of the evolution of Indian commercial banking and its experience, it has not touched upon some important problems facing the Indian banking system today. These are: large overdues, low productivity, low profitability leading to diversification through subsidiaries to generate surplus for maintaining viability. The paper does not also refer to the problems of additional overhead costs, administrative and personnel problems which are likely to arise from the adoption of the service area approach by the banks. These are the future challenges which the banks would have to face and the paper does not bring out whether the commercial banks, with the given structures and procedures, would be in a position to meet the challenges; nor does it suggest any solutions.

International Setting

The two papers, one dealing with the reform of the international monetary system and the other with international borrowing, seem to provide the international setting for the development theme of the Summer School. The first, presented by Rasaputra of the Central Bank of Ceylon, covers the familiar ground of international monetary problems and the efforts being made to correct them. While nothing extraordinary could be said now on the subject of international monetary reform, which has been discussed over and over again since the collapse of the Bretton Woods arrangement, the paper by Rasaputra makes some pointed observations on the subject. The paper starts by saying that one of the main causes for the present disarray in economic forces is the structure of the present monetary system which has been brought about through years of neglect due to the inertia and inactivity of the rich developed countries to get together with developing countries to arrive at a solution. It is also due to lack of understanding of the monetary system and the way it works, as is seen clearly in the events that overtook the financial markets in the form of unstable exchange rates, growth of the Eurocurrency market, uncontrolled lending and the stock market crash. Besides, the IMF which has been given the necessary authority to supervise the monetary system exercises its powers of surveillance more on developing countries than on the developed and this has been one of its main weaknesses. There is also a tendency to move towards a more liberal system of privatisation, thus leading to a market-oriented international monetary system.

Rasaputra identifies certain areas of reform. The major area of reform is th exchange rates. Neither the Bretton Wood formula nor the floating rates will give a ideal exchange rate that would facilitate th movement of goods, services and capital t promote optimum growth. Though th markets are used to dealing with floatin rates, uncertainty prevails in trade an payments which has its repercussions on pro duction, employment and growth. Secondly the role of IMF in managing the exchang rates has been considerably reduced by th demise of the Bretton Woods system. Th belief that floating rates would lead to a more organised adjustment process guided by market forces has not been borne out, a is reflected in continuing uncertainties imbalances in balance of payments, increas ing movements of speculative capital an erratic movements in exchange rates. Third adoption of target zone may have limited significance if IMF's surveillance is confined to borrowers from the Fund. Fourth, the in adequacy of IMF resources creates a liqui dity problem, forcing the countries to borrow from private capital markets without any conditionalities. Finally, there is the problem of transfer of resources from developing to developed countries as a result of heavy accumulation of debts. By way of conclusion, Rasaputra says that proposals for monetary reform should not be discussed only at the Rich Man's Club, that unilateral decisions taken by developed countries cannot lead to a satisfactory system in the long run and that the developing countries should have a share in the decision-making process.

The paper on international borrowing and economic development by Robert J White outlines briefly (a) the sources of capital for development and (b) the reasons for borrowing in general and puts forth the maxim that sound investments make borrowing profitable. The paper also makes the point that people or nations who borrow now without careful consideration of the need for and the means of servicing repayment, misunderstand the nature of debt and that debt mishandled carries its own penalties. After tracing the developments from oil prices to the debt crisis. White observes that international debt obligations can be met without driving the debtors' economies to the ground only by turning the current account deficits into surpluses. This can be achieved by taking the high road of export-led growth or the low road of import-depressing recession. Of the two, the former is clearly more attractive. An export-led recovery based on currency depreciation and restrained domestic spending creates a favourable climate for debt-servicing. White cites the experience of Australia and South Korea as case studies in weathering the debt problem and draws the conclusion that successes such as Australia and South Korea demonstrate that the risks can be managed if there is willingness to implement painful adjustment policies in the face of adverse and unforeseen circumstances.

Considering the growth and magnitude of the international debt problem and the com-

plications it led to as also the efforts being made to provide relief to debtor countries, White's analysis of international borrowing seems an oversimplification. Simiarly, the debtor economies being different as also their problems, the success stories of Australia and South Korea may not be of much guidance to these countries. Besides, the paper gives the impression that the debt crisis is the debtors' own making and that they have to accept the process of adjustment however painful. This is unrealistic. Though the debtor nation did borrow for a number of reasons, the liquidity crisis they got into was due to certain developments over which they had no control, i e, high interest rates, economic recession, decline in commodity prices and exchange rate variations. Lastly, it is surprising that presenting his paper in 1988, White did not even refer to James Baker's plan to provide relief to heavily indebted nations particularly in Latin America.

Capital Markets

In his paper "Capital Markets and Economic Development" Phillip B Lassiter of Citicorp International focuses attention on the role that capital markets play in efficiently moving capital from the sources to its users and the impact on economic development. For the capital markets to contribute to economic development, there must be a framework that (a) brings together holders of surplus funds and users of such funds and (b) offers to both investors and issues a broad spectrum of investment choices in terms of risk, reward and liquidity. Further, the growth and development of capital markets requires an environment that inspires confidence—the main ingredients of confidence being political stability, favourable regulatory/tax environment, reliable information flow, liquidity and perceived fairness.

Recognising that in the case of developing economies, the size of investment and the long-term pay-back requires external resources to supplement scarce domestic capital, Lassiter considers funding from external resources as most suitable, though it is not without pitfalls, as the recent international lending crisis has shown. However, this experience has yielded some basic lessons which according to Lassiter are: (a) it is not so much the absolute size of external finance as its mix that causes concern; (b) the importance of proper mix of direct investment and debt; (c) the case for investment in import substitution industries where economies of scale are not likely to be cost competitive; and (d) domestic industries, over time, must be exposed to world competition. Towards the end of the paper Lassiter touches upon the impact of capital markets and economic development on the banking system and is of the view that in developing countries, traditional banking would essentially disappear and illustrates this possibility by reviewing the evolution of banking in the US. The accelerating pace of technological change and information cost reductions will continue to radically alter the role of banks and the competitive environment. In the 1980s banks came under much pressure as securitisation and globalisation of markets gained momentum. In conclusion, Lassiter observes that banking systems in all economies must recognise the need to adjust their roles to respond to the changing environment and that banks have the opportunity to influence and shape the evolution of capital markets in developing economies.

While much of what Lassister says may be valid, in developing countries like India, given their structure, control and ownership, banks' role in shaping the capital market is limited. On the contrary, the developments in the capital market seem to influence the role of Indian banks—the recent manifestation of this being the process of disintermediation. It is this rather than technological progress and information cost reduction that may reduce the traditional role of Indian banks. Incidentally, Lassiter makes no reference to deregulation which, along with technological change and cost reduction, has made the banking environment more competitive.

Monetary Policy

The paper "Monetary Policy Revisited" by I G Patel is perhaps the best of the lot because of the incisive and illuminating nature of the analysis and because of its relevance to economic management in the context of developments, in both developed and developing countries. Patel begins with the question whether the recent monetary policy experience of industrial countries has any relevance to developing countries and observes that the question cannot be dismissed as irrelevant simply because there are obvious differences between industrial and developing countries. According to Patel, there have been of late far-reaching developments at least in some developing countries, particularly in the debt-ridden countries, and it would be interesting, therefore, at the present juncture, to look at the evolution of monetary policy in recent years with one eye on the developed countries and the other on developing countries.

Taking the industrial countries first, Patel refers to some important features of monetary policy and comments on them. First, there has been a shift from fullemployment as an objective of economic policy, to control of inflation; as far as trade-off between growth and control of inflation is concerned, there has been a common ground now in developed and developing countries and there is no trade-off but a virtuous circle where growth and control of inflation mutually reinforce each other. Secondly, there has been a shift of emphasis from short-term management to long-term growth in developed countries, that is, a shift from demand management to supply side economics or from macro to micro economic management. Third, there is the paradox that, while there is a decline in emphasis on short-term demand management, there is an equally firm belief that inflation can be curtailed by controlling demand. As far as anti-inflationary policies are concerned, there is no difference between so-called monetarists and Keynesians as to the need for reducing demand; the difference, if at all, is about the instruments or policies to be applied for reducing demand. Fourth, in industrial countries, monetary policy is viewed in the context of inflation and not in the context of growth. In the developing countries, while promoting development is a primary concern, there are other considerations related to monetary policy. Therefore, in developing countries a good monetary policy may well be one of great self-restraint. Fifth, in industrial countries there has been a growing preference for free market and resistance to government intervention or regulation. Finally, apart from the ideology of *laissez faire* and developments

in financial markets, some of the theoretical refinements in recent years have argued for a less active role for monetary policy in industrial countries. These refinements are: monetary rule, rational expectations and the Radcliffe statement that money is only one among financial assets—each differing in respect of yield or liquidity. Patel concludes that the inference suggested by the developments in industrial countries is that monetary policy is relegated to a more modest role.

Turning to developing countries and the lessons they can draw from their own experience and that of developed countries, Patel focuses attention on certain important aspects of monetary experience. First, monetary targeting. Given the objective of growth with reasonable price stability, it is considered necessary to keep the growth of money supply in step with the demand for it, which is assumed to be uniquely related to national income. This line of reasoning has led in practice to some version of monetary targeting in developed and developing countries. Criticisms of this approach are many: departures from monetary targets are so common as to make them cosmetic; monetary targets at best are intermediate targets; in the ultimate analysis, monetary targeting depends on the integrity with which it is set and adhered to. Can the central bank and the government come to a reasonable understanding on this? Second, discussion on interest rate policy in developing countries should distinguish between two aspects: on an average and over the longer run, how high should the real rate of interest be to provide maximum possible incentive for savings without unduly inhibiting investment? The other aspect is whether the system of administered interest rates be given up to restore flexibility to the rates which would reflect fluctuations in demand. The argument behind the prevalence of administered interest rates in developing countries is the need to avoid excessive variability in interest rates. There are the standard arguments about the relative ineffectiveness of interest rates. According to Patel, while some use of the interest rate instrument is necessary, caution is necessary in its use. The concept of competition in interest rates should also be accepted with great caution. Third, given the limited role of monetary targeting and also the interest rate as a weapon, central banks in developing countries would have to rely on quantitative and direct controls. Without trying to be dogmatic, developing countries can learn from the experience of developed countries which have replaced detailed controls by more general guidelines to encourage competition, while the financial institutions will have to suffer risks inherent in competition. Fourth, it would not be desirable for developing countries to abolish exchange control as it gives them a somewhat greater degree of independence from external developments; but there is need for discussion of an appropriate mix of monetary and exchange rate policy in developing countries. Fifth, the debate and experimentation with stabilisation programmes in developing countries, particularly in the debt-ridden Latin American countries. Lastly, the unfolding liberalisation in many developing countries. The important question here is the role financial liberalisation can play as part of the total process of liberalisation. There is need for a degree of deregulation and competition leading to greater financial innovations. Patel sums up his discursive arguments by saying that monetary policy can at best have a subordinate and supporting role in both developed and developing countries, that there is the danger in developing countries of giving the central banks an exaggerated role and that in the ultimate analysis monetary authorities cannot do much better than emphasise that their own role is only modest.

Patel's paper is of considerable practical value from the point of view of monetary management in developing countries, as it views the entire problem in the context of recent experience of both developed and developing countries. Besides, the paper contains many suggestions which could be examined further. It is interesting that at several points in his paper Patel neatly demolishes some of the major conclusions of the Chakravarty Committee Report, of which RBI is never tired of talking day in and day out.

Competition and Regulation in Banking

The paper "Competition and Regulation in Banking" presented by M Narasimham deals with one of the current problems facing the banking industry in developed and developing countries. There has recently been a strong orientation towards greater reliance on market forces and less on administrative or policy regulation in regard to economic activity and the financial sector has been no exception to this trend. In fact, financial deregulation has become the new orthodoxy. According to Narasimham, while it is tempting to view regulations and competition as antinomies, in the practical world they co-exist, with the frontiers of one determining the extent of the other. Competition and regulation are not alternatives. Up to a point, an efficient and growth-oriented banking system would require some prudential regulation and supervision. The question is: up to what point? This is a judgmental question and the degree of regulation would vary according to the stage of economic development of a country. The goals of regulation, to the extent these could be generalised, are: (a) to promote and ensure the safety and stability of the financial system; (b) to promote economic growth through institutional development; and (c) to enhance the efficacy of monetary and credit policy. Competition in the banking and financial sector implies: (a) freedom of entry and exit of firms into and from the sector; (b) no geographical or portfol restrictions; and (c) absence of or minim regulatory authority. A measure of regul tion is needed to enhance competitio because regulation by and large operat through the market and uses market instru ments. Such market-oriented interventic takes the form of the authorities active participating in the market. India provide a notable example of the extension of i terventionist policies to orient growth c banking towards economic development.

Against this background it becomes clea why the appropriate balance between regula tion and competition leans more towards ac ministrative regulation in developing cour tries. Experience has however shown tha regulation in developing countries tends t become too wide-ranging and detailed to th point of over-regulation. The co-existence o regulation with competition can also be bas ed on encouraging non-price competitio through the provision of new and innovativ savings facilities and by improved efficien cy in service. Perhaps the realisation tha over-regulation has its price is bringin about distinct changes and this is reflecte in financial liberalisation in some south an south-east Asian countries. The most com mon aspect of deregulation has been in th area of administered interest rates. Similar ly, promotion of greater competition ha been in the enlargement of the number o credit institutions. Narasimham conclude by saying that one wants both regulation an competition but not too much—a conclusion which does not seem very helpful fo purposes of policy formulation.

To sum up, the subjects discussed at the International Banking Summer School deal with important facets of the role of banking in economic development. It would have enhanced the value of the publication if these facets had been put together to present a unified theme, instead of allowing the various papers to stand on their own. In fact the subjects covered mesh well into each other. In a developing country, the central bank as the monetary authority has to develop the financial infrastructure to promote institutionalisation of savings and investment. It has also to ensure financial stability by conducting its monetary and credit policy in a pragmatic manner without getting rigid or overactive. Commercial banks which are the links between the real sector and the central bank have to play their role by mobilising savings and deploying them in productive and preferred sectors. The capital markets should be enabled to play their role in mobilising resources, particularly equity capital, by creating appropriate investment climate. Avoidance of over-regulation and unhealthy competition should render the process of development smoother. Given these conditions, a favourable international trade and monetary environment coupled with capital flows on reasonable terms should contribute to the acceleration of the growth process in developing countries.

A History of Achievements

Ashim Kumar Roy

The Asiatic Society of Bengal and the Discovery of India's Past by O P Kejariwal; Oxford University Press, Delhi, 1988; pp xiv + 293, Rs 175.

KEJARIWAL has written this interesting story of the first 54 years of the Asiatic Society of Bengal. The members of the society, all Europeans until 1829, did pioneering work in many fields of knowledge. They discovered Sanskrit literature for the Europeans, translated law books, found out about Indian mathematics and astronomy, deciphered the ancient scripts of India, and brought to the notice of the world the names of the ancient emperors and dynasties. The *Puranas* mention Ashoka as one of the Mauryan kings, but say nothing about his greatness as a man or about the extent of his empire. The *Vishnupurana* mentions only the name of the Gupta dynasty of eastern India, but the names of the kings of this dynasty had been forgotten. Many other dynasties such as the Valabhis, the Maukharies, the Palas, etc, had faded from memory. In short, practically nothing was known about the political history of India before the coming of the Muslims. All these discoveries were made by the members of the Society.

Kejariwal first gives the condition of the intellectual life of India at the end of the 18th century. This he found was nearly moribund. Sanskrit was a dead language. Writings in most other Indian languages, except Urdu, had lost their creative vitality. The only things the Indian intellectuals discussed were grammar and logic, both essentially barren subjects.

Europeans had started coming to India in the early 16th century. They were mainly soldiers, merchants, pirates or outlaws. They were not interested in cultural matters. A few missionaries also came to India, and some of them learned Sanskrit for professional reasons. Among these was Pons, a French priest who, it appears, was known for his scholarship. In 1718, the librarian of the king of France wanted to build up a collection of Indian texts. Pons who was posted in Chandernagore in Bengal, as able to collect many works of the different branches of Sanskrit literature there.

In the second half of the 18th century, Pondicherry in south India became a centre of Indian learning. This was due to Maridas Pillai, a Tamil scholar who knew French as well as Latin. French scholars who visited Pondicherry became his pupils. Maridas translated the Tamil version of the *Bhagavata Purana* into French. The manuscript was sent to Paris where Joseph Deguignes found the name of Sandragoutten, i e, Chandragupta, in the list of the Maurya kings. Deguignes recognised in this name Sandrakottos of the Greeks, who was contemporaneous with Seleucas Nicator (303 BC). This clue to the chronology of ancient India was rediscovered nearly 20 years later by William Jones.

British interest in Indian studies started after 1765 when they took cover the administration of Bengal. Some knowledge of the Indian system of almanac-making was immediately necessary, for a calendar of Hindu holidays was required by the government. But more important was to find out the laws of the Hindus regarding inheritance, adoption, etc. The study got an added impetus due to the enthusiasm of governor general Warren Hastings in these matters.

Thus the time was ripe for Indian studies when William Jones arrived in India in September 1783. Jones had planned for himself a vast field of study, and engaged himself in these studies at once. On January 15, 1784 he formed the Asiatic Society. The members of the society carried on research in many fields. Jones was interested in literature. He translated the *Shakuntala* and the *Gita Govinda*. Samuel Davis's interest was in astronomy. He translated the *Suryasiddhanta*. Others worked on geography and natural history.

William Jones died in 1794. Among the scholars who carried on Jones's work was H T Colebrooke, a servant of the East India Company, and an eminent Sanskrit scholar. Many years later Max Muller called him the greatest Sanskrit scholar England has ever produced. Colebrooke started with the study of the social customs and laws as depicted in the ancient texts, but later his main interest was in mathematics and astronomy. It was he who discovered that the Indians excelled in algebra and were ahead of everybody else upto the 12th century.

Colebrooke was president of the Asiatic Society from 1806 to 1815 when he returned to England. H H Wilson, another great Sanskritist became the leading figure in the society. An interesting paper that was presented to the society in 1816 was on the 'Existence of the Hindu Religion in the Island of Bali'. John Crawford, the writer, dealt with the subject in great detail. He observed that the Hindu religion was at one time 'extensively spread throughout the oriental archipelago', but had since become confined only to Bali. Here it was the natural religion 'the religion of the nine-tenths of the people'. Many years later Indian historians re-discovered these facts.

Interest in Indological studies diminished among the British when in 1818 James Mill, in his influential work *The History of British India*, denied the existence of civilisation and culture in ancient India. However, not much harm was done, for, by this time, the French and other European scholars had got interested in Sanskrit studies. Schlegel, a German scholar, remarked, "Literary and scientific zeal appears to be unknown to the English in India, and the spirit once called into animation by Sir William Jones seems to have now become extinct."

Though enthusiasm for literary studies diminished among the English in India, it was replaced by the interest in archaeological, epigraphic and numismatic discoveries. The results of these discoveries were not of less importance in unravelling the history of India. Many of these discoveries were made in the period 1832 to 1838 when James Prinsep was the secretary of the Asiatic Society. Prinsep carried on his researches in Calcutta on the basis of the material collected in the field by many archaeologists, the principal among them being Cunningham. The name of Kanishka, the Kushan king, mentioned in Hiuen Tsang's travels, was found on a coin from the north-west of India. The Allahabad inscription about Samudragupta was fully read, and thus almost the complete genealogy of the Guptas could be prepared with this and the Bhitari inscription. The genealogies of the Vakatakas, the Valabhis, and the Kadambas, the dynasties whose names had been forgotten could be drawn up.

But the most important things that happened in this period were the decipherment of the Brahmi script and the identification of Ashoka. Ashoka's edicts which are mostly in this script generally mention him by his epithets *Devanampiya Piyadasi*. Prinsep who read this script could not at first identify this Piyadasi, who had spread his edicts throughout the length and breadth of India, was. The mystery was cleared with the help of the Chronicles of Ceylon, and it was established that Piyadasi was the Maurya king Ashoka.

Kejariwal gives full credit of decipherment of the Brahmi script to James Prinsep. He could have perhaps mentioned that his main aide in this effort was Kamalakanta Vidyalankar who later was made the pandit of the Asiatic Society and Librarian of the oriental books. He might have also mentioned that the German scholar Lassen had already deciphered a few Brahmi letters from some coins of the Indo-Greek kings whose names were inscribed in both Greek and Brahmi letters. But this is nit-picking in this work of painstaking research. The book is also pleasant to read.

Impact of Centre-State Relations on Indian Politics

An Interpretative Reckoning, 1947-87

T V Sathyamurthy

In the last four decades, India has undergone a transformation from a homogeneous polity in which power was shared between the centre and the states under the control of the ruling Congress Party into one in which control is shared between the centre which has continued to be governed by the Congress Party and the states in which a variety of different parties—of which Congress(I) is one—have won executive power in the legislative assemblies. Since the end of the Emergency, and to an even clearer extent since the induction of the Rajiv Gandhi government, an entirely new chapter of co-existence between rival segments of power-holders at the centre and in the states seems to have begun.

This paper discusses the changes in centre-state relations and their impact on Indian politics using the following periodisation: (1) the era of linguistic/cultural differentiation within a framework of unchallenged unity and integrity of the Indian state (1947-67); (2) the era of centralisation following the challenge from the states (1967-77); (3) an interregnum of attempts to redress the balance of influence in favour of the centre (1977-84); and (4) the era of coalition and co-existence between the centre and the states (from 1985).

DURING the last four decades, the Indian state has addressed the task of coping with the tensions arising in different regions of the country by resorting to a variety of means, depending upon the particular facet—economic, political, constitutional or cultural/linguistic—involved in each specific conflict. Shifts have occurred in the major thrust of centre-state[1] conflicts and contradictions since independence which—by virtue of their magnitude and in view of the political actors involved—can be best analysed by appropriate periodisation. The interest of these conflicts for the student of politics stems from the following main considerations:

(1) Major political tensions *within* the ruling party at the centre—the ruling Congress Party in its different transmogrifications, undivided Congress, Congress (R), and Congress(I), except during the brief post-Emergency interregnum of 1977-1979/1980—as well as tensions between it and a wide variety of opposition parties, which offer more or less plausible alternative centres of power in different regions (and also at the centre, albeit in coalition[2]) are clearly reflected in the unfolding of centre-state tensions in any given period.

(2) Major economic tensions have tended to follow parallel lines. On the one hand, the contradiction between the rising urban and rural working classes (consisting of unskilled, semi-skilled and skilled industrial workers, and their multiplex trade unions rooted in the major political formations in the country—Congress, the Communist Party of India (CPI), the Socialist Party (SP), the Janata Party (JP), and the Communist Party of India-Marxist, CPI(M); and, unevenly and sporadically organised agricultural workers and poor peasants) and the ruling classes has, at least since the early 70s, been successfully deflected by the state. Not only have working class organisations become fragmented and emasculated, but also the ideological underpinnings which imparted class 'militancy' to them have been undermined as a consequence of the emergence of a number of trade union satrapies of which the Bombay textile mill workers under Datta Samant[3] constitute but the most recent and dominant example.

At the same time, the logic of economic development under Indian conditions of dependence and unevenness[4] has rendered the working class as a whole unstable in composition. The instability of the working class, during recent decades, has been endemic due to the rationalisation of industry and sudden shifts from labour-intensive to capital-intensive production, and the large scale transformation of subsistence agriculture into cash crop agriculture. As a result, widespread displacement of labour has occurred, leading to the expansion of marginalised, unorganised and seasonal-migrant labour forces which are, politically and economically, even weaker than the unionised workforce.[5]

On the other hand, as we have argued elsewhere,[6] there has been an intensification of the horizontal contradiction *within* the dominant class during recent decades. The conflict, at least in the short run, between the industrial bourgeoisie (which has been, on the whole, the greatest beneficiary of central planning and public sector expansion policies of the central government) and the rising rich and middle peasant classes (which have effectively displaced the 'feudal' landed classes of the colonial period) has not been easy to contain. By adopting the green revolution strategy, the Indian state created conditions under which the development of agriculture took place along lines that ensured not only a sharp differentiation of rural classes and contradiction between them in the countryside (i e, between the rich and middle peasants on the one hand, and the poor peasants and landless labourers on the other), but also a divergence of interest between the industrial bourgeoisie and the rural rich.

This horizontal conflict has been activated since 1972 when, for the first time, India attained self-sufficiency in food. Throughout the 70s and 80s, the tension between the industrial capitalist forces and the rural rich has been aggravated, with centre-state relations providing the political arena in which they are manifested. Except during the brief period (1978-79) when Chowdhury Charan Singh was successively finance minister and caretaker prime minister, the central government has been seen invariably as the custodian, by and large, of the interests of India's national industrial bourgeoisie in this conflict. Over the last two decades, the state governments (especially in regions where the green revolution has been successful—e g, the Punjab, Haryana, and Uttar Pradesh) have emerged as the natural champions of the interests of the rich and middle peasant classes.[7] This aspect of power-sharing between the centre and the states has undergone some modification since the assumption of power by the Rajiv Gandhi government.

(3) Cultural and linguistic differences, which have no doubt contributed to the political idiom specific to centre-state relations right from independence, are generally given too much or too little importance

n the two major strands of the literature—functionalist and Marxist. Whilst political and economic conflicts develop centre-state conflict dimensions of their own, conflicts involving linguistic and cultural (and even communal) dimensions have tended to assume significance under certain circumstances.[8]

First, language and culture are emphasised (especially in the regions lying outside the Hindi-speaking heartland of India, embracing Uttar Pradesh, Bihar, Madhya Pradesh and Rajasthan) as features unique to the different 'nationalities' comprising India.[9] Demands for an equitable distribution of political power and privileged access for weaker regions to economic resources are often couched in the language of demands for greater autonomy for the different states as well as for a more generous investment of central plan resources in remoter regions far away from the 'heartland'. Second, poorer states which do not have an active 'producing' class capable of accumulating surplus through agricultural or small industrial economic activities have shown themselves to be specially skilled in raising the banner of rebellion against the centre.

Thus, the Assam agitation[10] must be distinguished from movements such as Udayachal, Jharkhand and Gorkhaland movements in which the sheer despair of oppression by a majority community is believed to justify rebellion. The difficulties in the relations between the centre on the one hand, and on the other, small but strategically significant states on India's periphery can be legitimately viewed in terms of pressures generated by the ruling elements of the various 'nationalities' involved. Thus, for example, the ruling elements in the societies of Jammu and Kashmir and the 'seven sisters' of the north-east (with the exception of Tripura), which may be more or less adequately characterised as 'non-productive' petit bourgeois forces, have been involved during recent decades in constant agitation to secure increased flow of resources from the centre and the state governments' right to exercise control over them.

In the existing literature on the cultural and linguistic dimensions of centre-state relations, one strand lays far too great an emphasis on aspects relating to such questions as 'Hindi imperialism',[11] 'unitarisation of the federal polity'[12] by manipulating the Indian constitution, and 'foreign influences'.[13] Another strand tends (mistakenly) to dismiss these as unimportant in preference to locating centre-state tensions in the tensions and contradictions between classes *qua* classes, without providing a detailed empirical characterisation of the class configuration developing in India and of the role played by the Indian state in the process of its unfolding. Only very tiny segments of the literature show evidence of an appreciation of the complex character of the inter-weaving between linguistic/cultural and political/economic factors underlying centre-state conflicts in independent India.[14]

During the first four decades of independence, three major shifts have occurred in the pattern assumed by centre-state conflicts. The original impetus for these was provided by the cultural and linguistic divisions between heartland or hinterland states in which Hindi is spoken and the states/regions on the periphery in which non-Hindi languages predominate. Whilst the importance of the centre-state conflicts of the fifties for the unity of India were magnified and exaggerated out of proportion outside India,[15] they were viewed within India as no more than teething troubles of the new federation in which power was shared between like-minded politicians and mutually compatible economic groups in the states and at the all- India level.[16] Even so, it is worth remembering that intra-Congress rivalries between state-level leaders and the centre did take place in the political atmosphere surrounding a not-as-yet sufficiently fortified Indian state.

As political opposition to the Congress Party grew in the states on the periphery, apparently cultural and linguistic divergences acquired economic overtones and developed into competition between different segments of the ruling elements in a number of states for control over the executive power in governments. With electoral success, state-based 'nationality' movements in regions such as Tamil Nadu, along with much weaker national opposition parties have been able to mount a steadily accelerating challenge to the centre's power.[17]

The relationship between the Congress Party and the opposition parties in general and provincially based opposition in particular was modulated in a rapidly changing political atmosphere in which the Indian state was being steadily strengthened and its coercive power was becoming capable of ever more rapid deployment throughout the country. Even so, within a period of less than two decades ending with the Emergency, centre-state relations had come full circle with the dawning of the realisation that the era of massive centralisation of power in the state as in the central ruling party did not automatically result in the victory of the centre over the states. However, since the end of Emergency, and to an even clearer extent since the induction of the Rajiv Gandhi government to power, an entirely new chapter of co-eixstence between rival segments of powerholders at the centre and in the states seems to have been begun in the history of independent India.

The periodisation suggested in this article is as follows: (1) The era of linguistic/cultural differentiation within a framework of unchallenged unity and integrity of the Indian state (1947-67); (2) The era of centralisation following the challenge from the states (1967-77); (3) A brief interregnum of attempts to redress the balance of influence in favour of the centre (1977-84); and (4) The era of coalition and co-existence between the centre and the states (from 1985).

I

The political emphasis of the Indian constitution rapidly shifted from a confederal to a federal to a unitary conception of the Indian union during the brief life time of the constituent assembly.[18] The overwhelming popularity of the Congress Party throughout the country at the time of independence; ensuring a homogeneous government at the centre as well as in *all* the states, enabled the Indian government to create the impression successfully that the constitution was federal in character and power would be shared between the two levels of government rather than imposed by the centre on the states.

The pressure in favour of linguistic states intensified during the initial stages in the provincial Congress organisations in the non-Hindi regions, except in Tamil Nadu where a widespread popular opposition to Hindi led by non-anti-Congress elements went hand-in-hand with demands for a Tamil state defined by the regional language which emanated from the Tamil Nadu Pradesh Congress. Very early on the Indian state established a double standard in the measures that it adopted to deal with *mass* agitations (e g, the linguistic agitation of Telugu-speaking Andhra people led by the Congress) and class agitations (e g, the Telengana agitation, also in Andhra) led by the Communist Party of India (CPI).[19] Even though national leaders (e g, Nehru) were not nearly as keen after independence as they had been before the idea of linguistic states, the Congress Party organisation (which continued to bear the imprint of Sardar Patel's style of functioning even after his demise) was not averse to the idea of strengthening the state governments as a means of maintaining its mass following.

During the period 1947-57, there was no other party in any of the Indian states which posed a sustained electoral challenge to the Congress.[20] With the CPI tamed after Telengana into a parliamentary opposition force (after being forced to all but give up its insurrectionary or revolutionary role) and the Congress at the helm both at the centre and in the state,[21] the centre appeared to yield to linguistic pressures in line with the ruling party's commitment, during the nationalist struggle, to re-divide India into politically homogeneous states reflecting the country's national unity in cultural/linguistic diversity.

As a result of the recommendations of the high powered States Re-organisation Commission (SRC), large new states were brought into existence, Andhra Pradesh, Maharashtra, Gujarat and Karnataka. Nevertheless, the general understanding of the non- contradictory (in fact, even mutually complementary) character of the power-holders at the centre and in the states underlying the first great spurt of re-carving the internal boundaries of multi-lingual India did not extend to three specific areas.

In the case of Uttar Pradesh, a powerful

argument was advanced by K M Panikkar (one of the three members of SRC) to the effect that the opportunity provided by linguistic events to re-draw state boundaries should also be taken advantage of to divide the administratively unwieldy and economically unevenly developed state of Uttar Pradesh into two more viable states. This recommendation, in the form of a lengthy dissenting minute, was greeted with such hostility by the ruling party that it was widely believed to be animated by a touch of 'Hindi imperialism' and 'hegemonism of the north'.

The linguistic demands of the Punjabi-speaking population, largely but not exclusively Sikh in composition,[22] were ignored by a provincial leadership dominated by Hindus which engaged in a political manipulation of linguistic census in such a manner as to create a false impression to the effect that the Punjab was a largely Hindi speaking region. Nehru believed that the Punjab should be regarded as a special category of state (bordering as it does on Pakistan) to which the restrictions of 'unitarism' rather than the flexible adjustments characteristic of 'federalism' ought to apply.

In the case of Assam, compounded by the rising tensions of the north-east as a whole,[23] the linguistic conflict with took on a new dimension (by virtue of the fact that the economic, educational and administrative life of the state was dominated by an immigrant upwardly mobile Bengali community, and the economic future of the mass of the people belonging to the Assamese linguistic/cultural nationality was being imperilled by the regular exodus of Bengali people—mainly poor Muslim peasants and landless labourers—from East Pakistan into Assam) was not given the attention that it deserved until it exploded into a big violent crisis for the first time in 1962. In the north-east as in the north-west, arguments of national integrity, unity and security were invoked to suppress political demands in Assam that were met as a matter of course in other parts of the country.

By and large, however, 'federal' India, during the period 1947-67, was characterised by political homogeneity. The power of the state, as indeed power in the states, was wielded by the same political force represented by the Congress.[24] No great conflict had yet surfaced between the captains of industry who envisaged a dominant role for the state in the modernisation of the Indian economy on the one hand, and on the other, the newly arisen 'rural rich' whose interests in the states were largely represented by the pradesh Congress leaders in control of executive power.[25]

During this period, significant economic changes were introduced mainly through the instrument of central planning. The expansion of industry throughout the country under the aegis of the state, the widening of the market accompanied by its penetration of wider and wider sections of the population, the vastly increased scope for the expansion of private industry in general and small and medium industries in particular, and the opening up of the whole of the country to entrepreneurs from any part of it wishing to invest, produce and sell, contributed to a process of economic unification of India and of giving its rising industrial bourgeoisie a 'national' (as differentiated from a sectional, regional or partial) identity. The Indian national bourgeoisie, for its part, welcomed these changes and the opportunities that they presented for industrial expansion and diversification.[26]

The agrarian economy of India, also in the throes of far-reaching transformation, however, presented a somewhat different picture. Indian agriculture was even more unevenly developed than Indian industry. The social and political changes required to place Indian agriculture on a modern footing were enormous by comparison with the modest beginnings which most Congress governments were prepared to contemplate during the first three five-year plans.[27] Even although the days of the pre-capitalist landlord class of the colonial period were numbered, feudal relations of production continued to exercise a sway in many parts of India.[28] The rise of a new class of more or less 'capitalistically' orientated rich and middle peasantry (drawn largely from the ranks of the 'tenantry' of the colonial era) on the one hand, and on the other, the emergence of a 'wage' conscious landless labour class and poor peasantry (in the place of bonded serfs in a state of perpetual indebtedness) with a potential claim to the land tilled by them, was a slow process, the full dynamic of which had not yet begun to unfold itself.

The drama of subsequent decades, located in a plot dividing the agrarian and industrial segments of the Indian capitalist class into mutually antagonistic elements—combining together to constitute an increasingly fractured ruling class impinging upon a rapidly fragmenting political system—was scarcely discernible, except as a distant portent, so long as Congress successfully appeared to perform the tasks of a ruling umbrella party capable of serving the interests not only of antagonistic classes but also of mutually antagonistic segments within the same class.

On the eve of the fourth general election (1967), India presented a picture, the main components of which were a considerably more powerful state (than at independence), capable of exercising coercive power on the mass of the population more or less at will, an economy dominated at the national level by the state acting mainly in the interests of the national bourgeoisie and a rising class of as yet not strongly differentiating rich and middle peasantry, and a polity in which the intra-party differences of the Congress revolving round the question of the relative autonomy of the states within the federal framework of the Indian constitution were rapidly yielding place to conflicts of a substantial nature between the Congress Party on the one hand, and on the other, national and regional opposition part[ies] belonging to the entire political spectr[um] from the left to the right.[29]

The failure of successive Congress a[d]ministrations at the centre and in the sta[tes] to alleviate the harsh economic conditi[ons] of the mass of the Indian people led [to] widespread alienation and disaffecti[on] throughout the country which were reflect[ed] in the disastrous performance of the ruli[ng] party in the 1967 general election in [a] number of states and in its much reduc[ed] majority in Lok Sabha.

II

Of the several opposition governmen[ts] which took power in the states during t[he] interregnum between the indecisive four[th] general election and the much more decisi[ve] fifth general election (1971), the governme[nt] of Tamil Nadu led by the Dravida Munnet[ra] Kazhagam (DMK) Party[30] was the first [to] take on board the question of centre-sta[te] relations on a political level in a systemat[ic] manner. In the other states where the Co[n]gress Party had lost control, executive pow[er] was wielded for brief uncertain periods (i[n]terspersed with intervals of President's ru[le] under the governor) by far-flung coalition[s]. They were inherently unstable by virtue o[f] their eclectic political colouration, and the[ir] sole purpose seemed to be to keep themselv[es] afloat in the face of the machinations of th[e] Congress Party which manifested a decisiv[e] proclivity to encouraging defections fro[m] almost all non-cadre parties (especially in th[e] Hindi-heartland states) with the aid o[f] monetary and other incentives.[31]

On the left of the political spectrum, th[e] 1964 split of the undivided CPI had the ef[fect] of hamstringing the much more popula[r] Communist Party of India (Marxist) CPI(M) in West Bengal, Tripura, and Kerala. For, the CPI(M) was, on the one hand, no[t] well placed (especially in West Bengal) t[o] cope with opposition from the Naxalites o[r] the Communist Party of India (Marxist-Leninist) (CPI-ML) elements[32] withou[t] unleashing violence and resorting t[o] desperate measures, whilst on the other, i[t] was unable to prevent the CPI from slipp[ing] into the role of the Trojan horse of th[e] left by edging closer and closer to the ne[w] brand of shibboleth socialism that the rul[ing] party was propagating during the run u[p] to the 1971 general election.

Although CPI(M) did raise the issue o[f] centre-state relations during the 1967-6[9] United Front experiments in Kerala, Wes[t] Bengal and Tripura (in which it shared ex[ecutive] power with other parties), it[s] substantive contribution to the debate ha[d] been minimal. The Rajamannar report,[33] commissioned by the Tamil Nadu govern[ment], was the first detailed official docu[ment] published by a state government to dea[l] with various aspects of the political, finan[cial] and economic relations between the cen[tre] and the states.[34]

The ruling party at the centre was much nore concerned during this period with efurbishing its image in the eyes of the mass of the Indian electorate, whilst the Indian tate embarked upon a strong programme of containing popular unrest, of de-stabiising popularly elected but oppositionontrolled state governments, and of attemping to emasculate and crush left parties in general and CPI(M) in particular. The already impressive and far-reaching coercive power wielded by the Indian state apparatus was further augmented in the performance of these repressive tasks by repeatedly invokng the need to safeguard India's unity, integrity and security from internal and external threats.

The strategy adopted by the leadership of the Congress Party to improve its public standing consisted of provoking an internal split aimed at cleansing the organisation of the baleful influence of the so-called 'Syndicate' and entrenching the sway of a catchy brand of pseudo-radical populism championed by those in positions of influence who favoured a greater centralisation of power and a much more *dirigiste* orientation to politics in the states.

It was, in fact, during this period, that the practice was begun of the central organisation of the party imposing its own nominees for the chief ministership of Congress-ruled states and of changing their incumbents at will.[35] At the same time, the practice of democratic election of office-bearers at various levels within the party was brought to an indefinite standstill.[36] Thus, even though the immediate reason behind the 1969 crisis within the party was provided by intra-party differences over who should be the Congress nominee in the presidential election (1969),[37] the organisational changes initiated during the 1969-70 period were to have far-reaching effects on the internal working of the Congress Party, on the role of the Indian state in dealing with legitimate opposition, and on the role of the Indian Constitution and the machinery of government established under its provisions.

During the period 1969-75, attempts were made by the centre to clamp down opposition which manifested itself mainly in the form of trade union agitation by organised sections of labour, a brief but unconvincing return on CPI(M)'s part to revolutionary activity[38] after its retreat from the parliamentary path compelled by the ruthless application of state power against the organisation and its cadres, and the mass movement (especially but not only in Bihar and Gujarat) against corruption under Jaya Prakash Narayan's leadership.[39]

Compared to these large-scale manifestations of discontent,[40] the challenge—already watered down in content and portent due to years of less than incorruptible exercise of power, to say the least—posed by a regional opposition party in control of executive power in a single state (DMK of Tamil Nadu) was negligible. The centre under the Congress Party and the Tamil

Nadu state under DMK had become habituated to a regimen of co-existence without wires being crossed between the two sides about the extent of leeway a state could expect from the centre. All this, notwithstanding the political wisdom enshrined in the celebrated Rajamannar report.

The impetus for the Indian Emergency (1975-77) was thus derived not from any contradiction between the different instruments of federal power representing the centre and the states, but predominantly from political challenges that sprang from out with the confines of government and which were interpreted by the Indian state as a threat to its integrity and security rather than as demands for a new democratic mandate for the control of its power. The full impact of the Emergency can only be understood against a background of three related considerations. First, with the success of the green revolution, powerful political forces rose to the surface in a number of regions which represented the interests of the 'rural rich', more specifically the rich peasantry and the middle peasantry.[41] Whilst the Congress Party was in a position to put itself forward as the champion of the interests of the rich and middle peasant classes through the ranks of its regional elites, its influence among these classes was being eroded for two major reasons:

(1) The centre came under increasing pressure from industrial capital to release some of the surplus derived from agriculture for furthering the industrialisation and modernisation of the Indian economy. With the achievement of self-sufficiency in food, it was argued, the balance between industrial capital and agricultural capital should be reconstituted by government policy at the state level aimed at reducing grants, keeping down procurement prices and introducing a measure of agricultural taxation.

(2) The rural poor (and, in particular, the landless labourers and the poor peasants), largely consisting of low caste people and Muslims, who looked up to the Congress Party which they supported in elections, bore the brunt of local oppression by landowning castes whose interests were served by the ruling party as well as several regionally-based opposition parties.[42] Over a period of time, the rural poor became disenchanted with the Congress as well as with other non-left regional parties.[43] Except in Kerala, West Bengal and Tripura where CPI and CPI(M) had shown themselves to be capable of introducing limited but enlightened land reform, and in Karnataka where the relative lack of entrenched rich peasant power enabled the Congress chief minister Devraj Urs to implement (during the 70s) a liberal land and agricultural policy, the plight of the poor peasantry and landless labourers rapidly worsened throughout India in an economic atmosphere of downward differentiation leading to an expansion of the ranks of agricultural (and especially landless) labourers. The Emergency simply added a new dimension of state oppression and tyranny to the economic and social oppression that they suffered in their daily lives. All the more ironic, in view of the government's claim that its 20-point (and Sanjay Gandhi's five-point) justification of the Emergency—that it was solely inspired by concern for the welfare of the poor and the oppressed.

Moreover, the 1969 split, far from healing the rift within the Congress, simply had the effect of opening the floodgates of factionalism, groupism and dissidence even wider. In order to deal with the process of internal disintegration and the momentum rapidly gained by the growing contradiction within the party between those in control of state power (i e, the central leadership personified in the prime minister[44]) on the one hand, and on the other, the Pradesh level leaders, power was concentrated in the hands of a coterie which enjoyed the confidence of the prime minister and her family. The Pradesh Congress organisations were pitted against opposition parties (e g, the Bharatiya Kranti Dal (BD) and its various subsequent fragmentations and transmogrifications) which put themselves forward as champions of the rich and middle peasant classes in their struggle against a centre eager to seize the political opportunity to compel them to agree to a policy of transferring surplus from agriculture to industry by reversing the terms of trade between the two sectors of the economy. They were also confronting the central Congress leadership which took advantage of endemic dissidence within the ruling party[45] to impose its own nominees as chief ministers of Congress-ruled state governments and leaders of the various Pradesh Congress organisations.

The Pradesh Congress organisations were thus undermined and their leaders (with individual exceptions) lost touch with the mass of the people. At the same time, money power became a substitute for mass contact. A huge parallel economy fuelled by black market money became the engine through which such a basic transformation of the Congress organisation was achieved in such a brief period of time. Several leaders who had a talent for making the right contacts with black market barons emerged within the organisation resulting in support for the government being purchased rather than won by argument and persuasion.[46] The Indian state did little to curb the black economy which, from the early 70s onwards, had become the demi-goddess presiding over the fortunes of the ruling party of the government.

Further, the literature on political developments in India rightly lays stress on the enormous increase in the coercive power of the state during the last quarter of a century and the consequent undermining of democratic processes, values and elementary liberties guaranteed under the Indian Constitution. At the same time, popular democratic resistance to the government's arbitrary political behaviour has also markedly increased during the last two decades though it is not invariably manifested in a concerted manner except when electoral opportunities become available.[47] Established political parties including cadre-based organisations had failed to provide adequate leadership in channelling popular discontent in a democratic and constructive manner. However, during the Emergency, they did take part in a joint organised democratic resistance[48] to the central government's arbitrary rule which spread far beyond the confines of party-based action to mass-based opposition. The success of such a general strategy of opposing the Emergency was reflected in the resounding defeat suffered by the ruling party at the centre and in a majority of the states in the general and state legislative assembly elections held in 1977.

Centre-state relations, during the 1969-77 period, were practically reduced to a state of near non-existence as a problematic of federal politics in India. Unitarism triumphed under the aegis of a strong state whose power was controlled by a ruling party which had lost its democratic mainspring. Centre-state relations were, at independence, orchestrated in accordance with an equilibrium model in which politically homogeneous states on the one hand and the centre on the other acted as countervailing forces in the evolution of a powerful post-colonial state. At the end of the Emergency and on the eve of the 1977 general election, however, they had undergone a paradigm shift characterised by a puissant centre presiding over a federation of thoroughly enfeebled states.

The Indian state itself was no longer controlled by a popular mass party functioning through a complex and reticulated organisation but by a clique of powerful elements which could be relied upon to strike terror among potential opponents of the new brand of politics.[49] The 1977 elections exposed the shallowness of the achievements of the Congress as the ruling party and helped reverse the process of paradigmatic shift described in this section by strengthening democratic opposition to the regime and once again bringing out the question of centre-state relations into the open as one of fundamental importance for the future of the Indian state.

III

The 1977 general election provided the first occasion for the transfer of the control of state power from the Congress Party to the loose-knit Janata coalition representing a variety of ruling class interests[50] without putting on an artificial gloss of homogeneity to cover their disparateness and contradictions. Even though the new ruling coalition, unlike the Congress Party, was both organisationally and ideologically weak, it did preside over a state which had become immensely strengthened during the previous three decades.[51]

Despite its impressive majority in the Lok Sabha, Janata's grasp of state power was, however, severely compromised by its lack

of political clout and by the chronic inability of its ageing leaders to unite together on a positive programme.[52] The abrupt change from an autocratic unitarist to an entropic polyglot pattern of wielding state power was accompanied by centrifugal tendencies plaguing the very heart of the political system in its day-to-day functioning.

Yet, the new leaders (who were uncompromisingly, 'constitutionalist' in their determination to restore the primacy of parliamentary institutions and their practices in spirit as in letter) shared the political orientation of their predecessors on the question of centre-state relations.[53] They were not basically sympathetic with demands for increased autonomy from the states except in certain well-defined spheres, and certainly not when they were couched in combative political terms. Their grounds for believing that a strong centre and weak states did not represent an unhealthy combination were similar to the arguments advanced by the Congress Party when it was in power.

The sudden removal of the Congress Party from the centre, followed by the election of a number of state governments led by parties other than the Congress[54] breathed new life into the question of centre-state relations which had been put under constitutional sedation following the systematic de-stabilisation by the centre and the Congress Party of the non-Congress state governments during the period 1967-70. The resurgence of interest in this question in post-Emergency India was manifested in three different forms.

(1) States in which there was a strong tradition of Congress rule, where its popularity had not suffered during the Emergency,[55] found themselves on the defensive for the first time since independence. Their governments attempted to raise the question of the autonomy of states by protesting against imagined encroachments by the centre which was under the control of the traditionally opposition forces. The very act of restoring the Constitution to its pre-1975 condition by the new government at the centre was criticised by the Congress chief ministers of the southern states of Karnataka and Andhra Pradesh and by the Pradesh Congress organisations as a deliberate attempt to curtail state autonomy. In the event, not much political mileage could be derived from such protests.[56]

(2) Following Janata's landslide victory in the 1977 general election, a number of non-Congress governments won majorities in the state assembly elections that followed in its wake in many states. Janata, CPI(M)-led United Left Front (ULF) and other governments[57] took control of executive power based on substantial majorities in the assemblies. In putting the centre-state relations issue back on the political agenda, the leaders of these new ruling parties/coalitions were seeking not to confront the centre but rather to raise a number of crucial questions affecting economic development.[58] In other words, the question of centre-state relations was raised by a number of state governments

as a means of readjusting the relations between the two sides and of achieving a *modus vivendi* that would take account of genuine economic and political grievances. Despite the new prime minister's personal reluctance to depart from his predecessor's general line on the subject, the Janata government—itself new to the art of wielding political power and accustomed much more to an oppositional than to a governmental role—was, by and large, prepared to accommodate these pressures mainly by a return to the Constitution and by re-activating such instruments as the National Development Council (NDC)[59] The Janata government also reviwed the process of planning, specifically with the aim of bringing about a mutually acceptable readjustment of fiscal allocations by the centre to the states, and of initiating agricultural procurement policies from a much more differentiated perspective than that to which the centre had been accustomed in the past under successive Congress prime ministers.[60]

(3) From the perspective of centralists/unitarists, agitation for greater political autonomy for the states assumed its most dangerous form whenever it was advanced in the name of more or less direct mass democratic political participation of aggrieved segments of the people. Thus, in the Punjab, in Jammu and Kashmir,[61] in Assam, and in several of the north-eastern states, pressure for a radical re-ordering of centre-state relations did not arise during this period (1977-84) from political parties/coalitions in control of state governments as such. Rather, it arose from powerful political movements enjoying a degree of mass popularity[62] which they were in a position to augment by carrying the banner of political protest and by raising demands of a basic nature which would have been stifled in the past by a powerful centre on the ground that states on India's periphery were specially sensitive and vulnerable to foreign penetration and infiltration.

During the Janata interregnum, these popularly-based forces seriously reared their heads for the first time with the covert encouragement of Congress(I)[63] whose main aim was to expose the political weakness of the Janata, to undermine it by exploiting its inner contradictions, and to bring its rule to an end by whatever means available.

In the Punjab, the Congress(I) strategy took the form of supporting Jarnail Singh Bhindranwale as a fundamentalist Trojan horse within the political sphere of the *Shiromani Akali Dal* (SAD) and the *Shiromani Gurudwara Prabandhak* Committee (SGPC). As a result, the SAD-led government (1977-80) was successfully destabilised more or less simultaneously with the bringing down of the Janata itself.[64]

It is important to note that the Janata Party in particular and the Janata government as a whole were deeply opposed to the fundamentalist Sikh political forces which gave an entirely new twist not only to the spirit of the Anandpur Sahib resolution[65] but also to the question of state autonomy itself. They were equally disapproving of the Assam students' movement and to populist movements such as the Mizoram National Front (MNF).[66] But, unlike the Indira Gandhi (Mark I) government (in its 1969-77 phase) which deployed all the political and governmental power at its command to thwart such movements, the Janata coalition found itself too much at odds internally to be able to give attention to these new tensions and contradictions entering the picture of centre-state relations in the aftermath of the ruling Congress Party's defeat.[67]

When Congress(I) was returned to power in 1980 under Indira Gandhi (Mark II), the crises which it had helped keep stoked up when it was out of power had already become firmly imbedded in the political life of the country. Our aim here is to outline the strategy adopted by the new Congress(I) government to deal with centre-state tensions during its four years in power.[68]

The Janata was a weak and badly-organised political coalition which accidentally gained control over an extremely powerful state. The weakness of the ruling coalition during the 1977-79 interregnum was reflected in the reduced effectiveness of the state in dealing with political tensions and conflicts.[69] By the same token when the Congress(I) took power, its hold over the state was qualitatively different from what it had been under the Indira Gandhi (Mark I) government.

Democratic opposition in different forms, once given a powerful voice not only by parties other than Congress(I) enjoying executive power in certain states but also by mass-based opposition movements challenging the centre's right to limit the democratic rights of the people, could no longer be stifled. Congress (I) was returned to power by an electorate which found Janata wanting, but which had by no means forgotten the Emergency or forgiven its perpetrators. There was no doubt in 1980 that the Congress(I) government was elected as a lesser evil and not as a popular alternative to the Janata.

The re-inheritance of state power by the Congress(I) in 1980 was marked by two other major shifts in Indian politics. First, the agricultural bourgeoisie had emerged as a formidable national force capable of claiming a share of central state power. It was no longer to be confined to the narrower limits of state politics. Chowdhury Charan Singh, as caretaker prime minister (July 1979-January 1980) became the political symbol of the insistent demands in favour of a shift in the terms of trade between industry and agriculture which had gathered momentum during the mid-70s. Even though it was not yet in a position to sustain itself in control of the commanding heights of state power, the agricultural bourgeois class had so successfully entrenched itself in the state structures that no ruling party (including Congress(I) could afford to underestimate its importance. The increased political restiveness of a number of state governments—not limited only to those governed by opposition parties but also extending to such impor Congress(I)-ruled states as Maharasht should be viewed as a reminder that In agricultural bourgeoisie have come to as a dominant class force with consider potential for national cohesion in foreseeable future.

Second, during its brief tenure, the Ja government, released from the strangle of its predecessor's socialist shibboleths slogans, embarked upon the second stag the Indian state's task of strengthe capitalist development in India.[70] It t the initiative to open up the Indian manu turing industry to powerful thrusts foreign and multinational captial under guidance of George Fernandes, the 'socia minister for industries. The task of fina ing the engines of capitalist development the gigantic but nevertheless chronic dependent Indian economy would, Janata government believed, require subst tial participation of foreign capital.

Whilst eager to continue the Janata po of encouraging foreign capital in Indian dustry, the Indira Gandhi (Mark II) gove ment was unable to reverse the democra political trends set in the country as a c sequence of the re-emergence of self-co dence among different (and, especially, relatively deprived) segments of the rul class and its supporters among the pe bourgeoisie and the intelligentsia (as wel organised labour) during the 1977- interval.

Notwithstanding attempts made by Indira Gandhi (Mark II) administration re-introduce the Emergency by the backdoo indecision and drift were the characteris features of its policy towards the vari regionally-based opposition parties a popular movements in different parts India. The prime minister continued espouse the view that opposition to the ce tre was *ipso facto* against the interest a integrity of the nation. But the ruling pa which controlled state power was far riven by internal dissension[72] (the m feature being the revolt of the agricultu middle classes) and by conflicts appeari in the seemingly menacing guise of prote by different nationalities, to prevent t creeping paralysis of the system of confl management that a democratic polity ba ed by a powerful state ought to be in a po tion to wheel into action.

Paradoxically, the centralising a autocratic approach adopted by the Indi government to centre-state relations and such regionally-based opposition to the ce tre as the Assam students' movement, as e emplified in a repeated resort to presiden rule in the offending states, had the effe of exposing the limitations of deploying t main force in the form of an unbridled u of the coercive power of the state appara in order to stifle democratic dissent. At t same time, not only was the Congress severely defeated in a series of sta legislative assembly elections during t period 1982-84, but also essentially dem cratically organised opposition to the ce

e in such states as the Punjab, Assam, and ammu amd Kashmir quickly acquired an verlay of communalism and 'extremist' iolence. Operation Bluestar and the eventual assassination of the prime minister thus ppeared as the obverse and reverse of the ame coin.

IV

Indira Gandhi's efforts to restore the alance of influence in the centre-state conlicts in favour of the centre failed because he was not willing to change her political nethods of the early 70s in the changed ocio-economic circumstances of the 80s. The Janata coalition had an adequate undertanding of the tensions brewing in the relaions between the national industrial bourgeoisie and the agricultural bourgeoisie which could only be resolved by loosening he political grip of the centre over the states and by establishing a broad consensus betveen the different opposing segments of the uling class dominating different spheres of he economy and in acute competition with each other for resources for development. ts failure lay in its inability to build a ruling political party capable of reflecting such consensus as an alternative to the Congress Party.

The failure of the Indira Gandhi (Mark I) government lay in the fact that the prime minister refused to acknowledge the need for a coalition between the agricultural and industrial (as well as other) segments of the dominant class, preferring instead an immobilised state to a centre in which different nterests would be reflected as they manifested themselves at the level of the state and n society at large. In an epoch demanding power-sharing between competing segments of the ruling class, the anomalous political behaviour of the Indira Gandhi (Mark II) government resulted in a petrification of the centre's resources for compromise and consensus.

Rajiv Gandhi's government (from 1985) has not departed from the style of functioning of the Indira Gandhi (Mark II) government; however, its instinctive understanding of the social and economic forces at odds with one another in the Indian polity is somewhat more pragmatic and less rigid than that of its predecessor. The development of centre-state relations during the present period must be viewed within a larger framework of the major tensions and contradictions of contemporary Indian society.

Under the Rajiv Gandhi government, the rhetoric of forging ahead into the 21st century[73] is being used to justify inegalitarian policies as well as an economic strategy directed towards an expansion of industrial capacity and towards increasing the resilience of industrial capital. Whilst the economic trend set in 1977 of injecting significant amounts of international and multinational capital has been given an additional fillip by the present government, the Janata government's policy of even-handed treatment of the industrial and agricultural

bourgeoisie no longer fits in with its general economic orientation. The needs of the agricultural bourgeoisie—a crucial class rooted in the states—which is committed to a general policy of modernisation, expansion of its productive base, and a more rapid reproduction of capital in its sphere (all with the continued aid of the state) can no longer be given the same importance as those of the industrial bourgeoisie.

It is a characteristic feature of the Indian political economy that agricultural and industrial capital cannot, in the long run, expand simultaneously within an indigenous framework. Each segment of the bourgeoisie would inevitably regard the preponderant development of the other as taking place at its expense. In recent years this trend has been increasingly discernible.

Dependent capitalist development under acutely uneven conditions of development of production relations cannot take place without giving rise, in the long run, to conflicts between different segments of capital or without transforming existing intra-ruling class conflicts from a basically non-antagonistic to an increasingly antagonistic state. But, in adopting Rajiv Gandhi as its most favourite candidate to date for piloting the ship of state into the future, the industrial bourgeoisie of India may have been prematurely confident of the potential for growth inherent in Indian capital and of its own capacity to withstand, even with the aid of state power, the vigorous onslaught of the rural rich that is bound to follow sooner than might be anticipated. It is against this general background that centre-state relations during the final phase of this discussion must be viewed.

Since its accession to power under Rajiv Gandhi's leadership, Congress(I) has had to face 16 state legislative assembly elections. Of these, ten states went to the polls within six months of the eighth general election (1985). State legislative assembly elections in the Punjab (1985), Assam (1986) and Mizoram (1987) were called on the basis of accords signed between the government at the centre and leaders of popular movements based in the states. Of the three most recent state legislative assembly elections (March 1987), those in West Bengal and Kerala were regular quinquennial ones required under the Constitution. The election in Jammu and Kashmir took place after a brief interruption of president's rule during which a deal had been hammered out between the National Conference (NC) (led by Farooq Abdullah[74]) and Congress(I). These developments throw into bold relief three trends of importance for the future of centre-state relations in India.

In the heartland states and in the states in peninsular India, the Congress(I)'s strategy of frightening the electorate by means of warnings that state governments controlled by parties other than Congress(I) could be starved of development resources was counter-productive to varying degrees. The sense of disgruntlement of local elites (predominantly rural in character, with some links with the wider economy through small industrial enterprises, especially in the south) laced with popular support for 'democratic' values (in the given context) led to opposition parties being returned to power with comfortable majorities.[75] In Uttar Pradesh and Bihar, the Dalit Mazdoor Kisan Party (DMKP)[76] emerged as a substantial force on the opposition benches of the legislative assembly with the Congress(I) in a majority.[77]

In Maharashtra, the People's Democratic Front (PDF), a coalition representing powerful agrarian interests, established itself as a substantial presence in the assembly, though not in a majority, after a successful campaign demanding crop protection insurance by the state and better procurement prices for jowar and cotton. The Congress(I)'s two-pronged strategy of dealing with a potential crisis in Maharashtra consisted of replacing the locally chosen compromise candidate for the chief minister's post by a more powerful figure from the central cabinet and of wooing Congress(S), the most influential segment of PDF, back into the Congress(I) fold.[78]

The case of Maharashtra also illustrates a fundamental weakness of the political organisation of the Congress(I). We have already noted that the erosion of internal democracy was an important factor in the debilitation of the ruling party in a number of states. Central dictation as to who should be chief minister as well as the arbitrary removal and replacement of elected and incumbent chief minister of the Congress(I)-ruled states with lightning rapidity and without proper consultation have sharpened the contrast between them and the states in which executive power is held by opposition parties which invariably function according to well recognised democratic principles practices and procedures.[79]

The second broad trend relates to tensions arising in the states closely linked to the heartland where a political backlash has affected the relations between the different segments of the regional elite. In Gujarat, for example, where the numerical proportion between 'forward' and 'backward' classes/castes[80] is more balanced than that prevailing in states such as Tamil Nadu, say, the policy of showing positive discrimination towards 'backward' castes, pursued by successive Congress governments of the state, was believed by 'forward' castes to have resulted in unfair disadvantage to them over the years in the spheres of education, employment, social welfare, etc.

The movement led by the late Jayaprakash Narayan during the mid-70s against government corruption caught on in a big way in Gujarat. After the Emergency, however, fresh agitation for social and economic justice was mounted by the socially 'forward' but by then deeply aggrieved castes. Their leaders claimed that 'forward' castes had indeed rendered economically 'backward' as a result of three decades of Congress governments' policy affecting their interests.

The central government, led successively by Janata, Indira Gandhi's Congress(I), an[d] Rajiv Gandhi's Congress(I) has been unab[le] to deal with this intra-elite strife in Gujara[t] in an effective manner because of the fea[r] that (1) a reversal of the policy of 'reserva[tion]' under pressure would be a cure wors[e] than the disease because well-entrenche[d] political and socio-economic forces represen[t]ing the interests of 'backward' castes/classe[s] would be up in arms[81] and (2) Gujarat i[s] not alone in facing the problem of the im[]balances where decades of working a polic[y] of 'reservation' has come home to roost i[n] the form of new pressures which cannot b[e] satisfactorily dealt with by a mechanica[l] reversal of existing policy.[82]

The case of Gujarat is of particular signi[]ficance in view of the fact that its relation[s] with the centre have always been close, eve[n] as its influence on the national economy ha[s] been considerable.[83] But the ruling Con[]gress(I), which was returned to power in th[e] 1985 state legislative assembly election wit[h] a sizeable majority, had so completel[y] miscalculated the mood of the middle clas[s] elements belonging to the 'forward' castes that its administration was brought to a hal[t] by strikes and social clashes[84] within weeks of assuming power. The centre's response to the crisis in Gujarat was to change the chief minister rather than to give political leadership by tackling the question of 'reservation' in a sensitive manner. Thus, even though Gujarat poses no great threat to the existing scheme of federal relationships in India, it illustrates the practically intractable nature of the socio-economic tensions and contradictions that can emerge under the specific conditions of adjusting political power relationships between unequally developed segments of ruling elites exemplified in the context of this discussion.

To the third tier of development of centre-state relations in contemporary India belongs the far more complicated questions posed by those states in which the economic logic of protest is overlaid by a clearly augmented consciousness of cultural, communal, linguistic, jurisprudential and other forms of neglect on the part of the Indian state. At the present moment, Punjab and Assam clearly belong to this category, but the states on India's land periphery (e g, Jammu and Kashmir and the north-eastern states such as Mizoram[85]) are equally susceptible to such pressures. Such social and cultural aspects of their role accrue to these peoples as minorities or separate nationalities (not to be confused with 'nations')[86] and they can only be brought into the mainstream by taking cognisance of their susceptibilities which have been suppressed by a stepping up of coercion on the part of the state apparatus.

The Rajiv Gandhi government's initiatives in respect of the Punjab question have, to date, wavered between extending the olive branch of conciliation to the aggrieved Sikh community in the hope of isolating Sikh 'extremists' on the one hand, and on the other, lapsing into a continuation of the repressive policy orientation of the Indira Gandhi

Mark II) government.[87]

The Longowal-Rajiv Gandhi accord (1985) eemed to open a fresh chapter of healing ne rupture between the centre and the state f Punjab based on a serious attempt on the ormer's part to remove the political, social nd economic grievances embodied in the nandpur Sahib resolution of SAD. But the kali Dal government which took power in eptember 1985 received no real support rom the centre which was content to blame ne popularly elected state government for ne persistence of terrorism and of tension nd conflict between the Sikh and Hindu ommunities. Not a single undertaking by ne centre outlined in the Longowal-Rajiv Gandhi accord was carried out.

Apart from the centre's belief that the administration of Punjab could not be left enirely in the hands of the government duly lected for the purpose,[88] it was subject to normous pressure from elements within Congress(I), particularly in neighbouring Haryana[89] (and, to a lesser degree, Rajasthan) which successfully frustrated ven the tentative moves which the Indian government appeared to be ready to initiate n relation to the demands of Punjab.

The Punjab situation deteriorated despite chief minister Barnala's determination to ustain the credibility and viability of the SAD government until, finally, the centre dismissed it (May 1987) on the ground that t was no longer capable of restoring law and order. In fact, however, the immediate motivation for dismissing the popularly-elected government of Punjab and imposing president's rule lay in the fact that the state egislative assembly election in Haryana was fast approaching[90] at which Congress(I) would have to acquit itself well if the massive erosion of the popularity of the Rajiv Gandhi government as signified in the results of the March 1987 state legislative assemblies' elections in different parts of India were to be staunched.[91]

The Punjab and Assam crises point up different dimensions of the question of centre-state relations. In Punjab, the main difficulty arose from the Sikh view of the link between politics and religion on the one hand,[92] and on the other, the reluctance of the Hindus to identify themselves primarily as Punjabis rather than as a part of the Hindu mainstream of India. The crisis engulfing Assam arose out of the indigenous Assamese population feeling outnumbered and marginalised in its own home ground. To some degree the problem faced by the Assamese in relation to the Bengalis and Bangladeshis has also been experienced by the different 'tribal' peoples of the north-east in relation to non-tribal settlers in their midst.[93]

By 1973, the proportion of indigenous Assamese to the total population of the state had dropped by over 20 per cent to well below 50 per cent, spreading alarm among a population which, only in 1967, had achieved a new stability with the formation of Meghalaya.[94] The formation of Bangladesh, far from allaying the fears of the indigenous population, aroused anxiety afresh with each successive wave of Bangladeshi emigration into Assam.[95]

The ruling party at the centre and in Assam was unconcerned about the impact of this massive influx of Bengali Muslims for the understandable reason that they,[96] in contrast to the Assamese inhabitants of the Brahmaputra valley (in the upper reaches of Assam), could be relied upon to give electoral support to Congress. But the resulting social disruption posed a threat to the communally-organised agrarian economy of the state because the new immigrants who were accustomed to radically different methods of cultivation sought to establish themselves on the land that they cultivated as individual owners.

The defeat of the Congress Party in the state legislative assembly election in 1978 was followed by the emergence of a mass movement, led by the students, highlighting Assamese grievances.[97] It focused attention on one main demand arising out of a grievance going back to the 60s.

Declaring that the East Pakistan/Bangladeshi immigrants were 'foreign' nationals, the student movement demanded that they should be repatriated to their 'homeland' or sent to any other part of India. The Janata government of the state (1978-80) was paralysed by strikes, blockades, and demonstrations which evoked massive support from the population.

When the Indira Gandhi (Mark II) administration took power, the Janata administration in Assam was summarily dismissed. Its place was taken by a much less popular Congress(I) administration which was defeated in the legislature within a short time. The state could not be governed by the centrally-appointed bureaucrats who stepped into the political vacuum resulting from the collapse of elected government. The student-led movements continued to demand that the Assamese people and not the centre had the right to disenfranchise 'foreign nationals' in the state as a prelude to expulsion.

A constitutional imbroglio of unparalled intensity was thus injected into the very heart of the dispute between the centre and the state of Assam. Even though the central government maintained a pretence of keeping negotiations alive with the student leaders, the prime minister was unwilling to resolve the dispute in a spirit of accommodation. The state legislative assembly election, called in February 1983, ended in widespread mayhem and murder.[98] A government of questionable legitimacy was installed in power in a political atmosphere which reeked of divisions between Assamese and 'tribals', Assamese and Bengalis, Hindus and Muslims, and Hindus and Christians.

The Rajiv Gandhi government's approach to the Assam question appeared to be at least as positive in character as its Punjab initiative. The new prime minister seemed to appreciate that, in order to maintain the *status quo* in broad terms in the country as a whole, the national 'ruling classes' ought to share state power with political forces dominant in the various regions. The Assam accord was signed in an improved atmosphere as a prelude to a fresh state legislative assembly election.[99] It is worth noting that the original demands of the student leaders which had been rejected by the Indira Gandhi (Mark II) government on the ground that they were constitutionally impertinent and injurious to India's integrity were accepted by the Rajiv Gandhi government on purely pragmatic grounds.

By thus distancing itself from the lame duck Congress(I) government, on the eve of the 1985 state assembly election, the centre weakened its already enfeebled position even further. In October 1985, the student movement gave birth to the Asom Gana Parishad (AGP), the first regional party in Assam's history which came to power on a platform emphasising its simultaneously national and regional character.[100]

The communal polarisation of the state had reached such serious proportions that the new government was obliged to begin its career cautiously under the careful scrutiny of the All Assam Students' Union (AASU) which has kept its identity entirely separate from that of AGP. During the last 17 months of its existence, the AGP government has not been signally successful in gaining the co-operation of the centre in the implementation of the Assam accord, especially with reference to the 'foreigners issue'. With the centre far too slow to respond to these pressures and with AASU radicalising rapidly on the issues underlying the tensions engulfing Assam since the mid-70s, the AGP government has lost a good deal of its initial momentum.[101] As in the Punjab, so too in Assam the centre has been caught in a contradiction between an awareness of the need to enlist the co-operation of regional elites and an unwillingness to modify the centralist orientation of the Indian state to which the Indian government has long become habituated.

During the last four decades, independent India has undergone a transformation from a homogeneous polity in which power was shared between the centre and the state under the control of the ruling Congress Party into one in which control is shared between a centre which has continued to be governed by the Congress Party and the states in which a variety of different parties (of which Congress(I) is one) have won executive power in the legislative assemblies.

A vigorous and determined effort on the part of the Indira Gandhi (Mark I) government to prevent this change from setting in by destabilising non-Congress state governments and imposing the central leadership's writ on Congress-controlled state governments in an arbitrary manner failed. But the Indian state has continued to grow in power and has been able to increase its coercive capacity steadily throughout the post-independence phase.

Since the end of the Emergency, attempts have been under way to accommodate the horizontal conflicts between the two main segments of the ruling class (viz, the national industrial bourgeoisie and the regional bourgeoisie, mainly but not exclusively rural in character). These have resulted in the emergence of fairly stable regional parties well entrenched in a number of states, in a strengthening of national parties such as CPI(M) and Janata in certain states, and in enhancing the influence of the rural element in the agriculturally important states where Congress control of the state legislative assembly is becoming predicated more and more on its capacity to collaborate and to share power with its competitors.[102] India may well be on the verge of a new era of power-sharing in which, despite new uncertainties over the correct constitutional relationship between the elected representatives in control of state power on the one hand and the indirectly elected president on the other,[103] powerful states can benefit from a strong Indian state controlled at the centre by a coalition of parties representing diverse ruling class interests.[104]

Notes

1 The constitutional, political and financial aspects of centre-state relations during the first three decades of independence are reviewed in the author's work entitled *India since Independence: Studies in the Development of the Power of the Indian State: Volume I: Centre-State Relations: The Case of Kerala* (Delhi: Ajanta Publications, 1985), pp 20-101.

2 The tension between and within different political parties is analysed in the author's essay entitled 'Maturity at the Polls: Contradiction, Dissent and Dissidence' (Delhi and Calcutta: *The Sunday Statesman*, January 16, 1983).

3 Datta Samant is but one example of trade union initiative being grasped from the well established unions by ambitious individuals. During the 70s, for example, A K Roy, a communist trade union leader, broke away from the communist trade unions and established a personal following among workers in eastern India.

4 See, for example, Ashok Mitra, *Terms of Trade in India's Economic Development*, (London: F Cass, 1976); A K Bagchi, *Private Investment in India: 1900-1939* (Cambridge: Cambridge University Press, 1972); and Francine Frankel, *India's Political Economy 1947-1977* (Princeton: Princeton University Press, 1977).

5 For an excellent study illuminating this process, see Jan Breman, 'Seasonal Migration and Co-operative Capitalism: The Crushing of Cane and of Labour by the Sugar Factories of Bardoli, South Gujarat' (in two parts), *The Journal of Peasant Studies* 6 (October 1978 and January 1979): 1 and 2, pp 41-70 and pp 168-209.

7 These classes, which roughly correspond to middle castes in a number of heartland states, have come to dominate the entire spectrum of political parties including Congress (or Congress(I)) and the Socialist Party (e g, Bihar) but not the communist parties. This has been particularly true since the Emergency. See, for example, T V Sathyamurthy, 'State and the People' (in two parts) (Calcutta and Delhi: *The Statesman*, March 14 and 15, 1985).

8 The most recent instance of linguistic and cultural passions flaring up at apparently short notice is provided by Goa (1986). Not unconnected with the unrest in the region has been a recent decision of the Indian cabinet to introduce legislation in Lok Sabha conferring statehood on Goa, thus inducting the 25th state of the Indian Union since independence. A few months ago, another union territory in north-eastern India, Mizoram, was also given the political status of a state. The state of Mizoram came into being after an agreement was signed by the Indian government with the Mizo National Front (MNF) under Laldenga's leadership which subsequently won power in the Mizoram state legislative assembly election (February 1987). See, for example, 'Mizo fighters seek ballot-box victory' (London: *The Times*, February 17, 1987).

9 See, for example, T V Sathyamurthy, 'Indian Nationalism and the "National Question"', *Millennium: Journal of International Studies* 14 (Summer 1985): 2, pp 172-194; and Prakash Karat, *Language and Nationality in India* (Madras: Orient Longman, 1973).

10 The characterisation of the roots of the Assam agitation has been the subject of acute controversy which is still being carried on in the columns of such journals as *The Economic and Political Weekly* (especially during the period 1980-85), *Mainstream* (especially during 1982; 85), *Frontier* (since 1980).

12 See, for example, Subrata Mitra, 'Competing Models of the State in Indian Political Discourse' (a paper presented at the Political Studies Association Conference) (Aberdeen, 1987, under publication).

13 See, for example, various articles in the two special issues on the Punjab, *Seminar* (Delhi), Nos 294 and 326 (February 1984 and October 1986).

14 This author is currently engaged in resear-

ching a series of volumes on this theme with a view to producing an empirically substantiated characterisation of state power in India since independence. The second volume of the series entitled *India since Independence: Studies in the Development of the Power of the Indian State: Volume 2: Centre- State Relations: The Case of the Punjab* is currently under preparation.

15 For example, Selig F Harrison, *India: The Most Dangerous Decades* (Princeton, New Jersey: Princeton University Press, 1960).

16 A glimpse of the amity that prevailed in the relationship between the centre and the states during the first fifteen years of independence is provided in the recently published correspondence between prime minister Nehru and the chief ministers of different states.

17 T V Sathyamurthy, 'Indian Nationalism..', op cit, *passim*.

18 See, for example, Granville Austin, *The Indian Constitution: The Cornerstone of a Nation* (Oxford: Clarendon Press, 1966); and Chandra Pal, *State Autonomy in Indian Federalism: Emerging Trends* (Delhi: Deep and Deep, 1984).

19 See, for example, P Sundarayya, *Telengana People's Struggle and its Lessons* (Calcutta: Desh Raj Chadha, 1972).

20 PSP in coalition with other minor parties did pose a challenge to Congress dominance in Kerala for a short time, but its leader Pattom Thanu Pillai was bought off by the Indian government with the Governorship of the Punjab.

21 Except in Kerala (1957-59).

22 Between 1947 and 1966 Punjab included the predominantly Hindu Haryana and parts of Rajasthan. Since 1966, with the re-drawing of state boundaries resulting in the creation of Haryana, the Punjab became a Sikh majority state by a small margin. This margin has since increased.

23 Tension developed along the two broad lines of the various tribal peoples of the sprawling north-east region (Assam and NEFA) seeking autonomy, and the indigenous Assamese-speaking population seeking to free itself of the Bengali economic and administrative stranglehold on Assam. Over a period of 20 years, the north-eastern stretch of the country was divided into seven states and union territories (of which Arunachal Pradesh and Mizoram have been conferred statehood during the last two years), Assam itself becoming truncated with the formation of Meghalaya. See T V Sathyamurthy, *Nationalism in the Contemporary World: Political and Sociological Perspectives* (London: Frances Pinter, 1983), Chapter 8.

24 Only in Kerala was a CPI-led government formed after the state assembly election of 1957 which was prevented from completing its normal legislative term by the centre at the instigation of the national and Pradesh Congress organisations.

25 The relationship between prime ministers Nehru and Shastri on the one hand, and on the other, the chief ministers of the larger states of the Indian Union was cordial and more or less equal. In fact, chief ministers of states such as Madras, Bombay (latterly Maharashtra and Gujarat), West Bengal, Uttar Pradesh and Bihar were accorded greater respect than union cabinet ministers within the Congress hierarchy. See note 17.

26 See, for example, Pramit Chaudhuri, *The Indian Economy: Poverty and Development* (London: Crosby Lockwood Staples, 1979), especially pp 17-75.

27 See, for example, B H Farmer, *Agricultural Colonisation in India since Independence* (Oxford: Oxford University Press, 1974), especially pp 87-117, 211-226, and 261- 298.

28 On the long and fruitful debate on the mode of production in Indian agriculture which deals with this question, see Alice Thorner, 'Semi-Feudalism or Capitalism? Debate on Classes and Modes of Production in India', *Economic and Political Weekly* 13 (December 4, 11 and 18, 1982): 49-51, pp 1961-1968; 1993-1999; and 2061-2066.

29 T V Sathyamurthy, 'Maturity at the Polls..' op cit.

30 T V Sathyamurthy, *'Dravida Munnetra Kazhagam* in the Politics of Tamil Nadu: 1947-1971' in B N Pandey (ed), *Leadership in South Asia* (London: Asia Publishing House, 1977), pp 426-460; R L Hardgrave (Jr), *The Dravidian Movement* (Bombay: Popular Prakashan, 1965).

31 In more recent years, Congress(I) has been known to have purchased massive floor crossings from opposition parties to the Congress prior to the swearing-in ceremony of newly-elected state legislatures, e g, Haryana (1982).

32 See, for example, Mohan Ram, *Maoism in India* (Delhi: Vikas, 1971), especially pp 38-77 and 122-136.

33 Government of Madras, *Report on Centre-State Relations* (Chairman: Justice P V Rajamannar), Madras: Government Press, 1968.

37 See T V Sathyamurthy, 'Crisis in the Congress Party: The Indian Presidential Election of 1969', *The World Today* (November 1969). Prior to the 1969 crisis there was only one instance of the presidential candidate's nomination for a second time (1956) being under inner party discussion because of Rajendra Prasad's known opposition to the *Hindu Code Bill*. Since 1969, however, there have been at least two major occasions on which constitutional issues have arisen on the question of the correct relationship between the president and the elected executive. The first con-

34 The Rajamannar Report should be read in conjunction with others such as K Santhanam, *Union-State Relations in India* (Bombay: Asia Publishing House, 1960) and P B Gajendragadkar, *The Constitution of India: Its Philosophy and Basic Postulates* (Nairobi: Oxford University Press, 1969), especially pp 63-88. See also T V Sathyamurthy, *India Since Independence... Vol I...*, op cit, pp 68-101.

35 During the second phase of this period (1971-77), chief ministers of Congress ruled states (e g, Gujarat, Bihar, Uttar Pradesh, Maharashtra and Andhra Pradesh) were changed frequently and in an arbitrary fashion by the Congress Parliamentary Board. During the Indira Gandhi (Mark II) government's rule (1980-84) chief ministers in Congress(I)-ruled states (with the single exception of Vishwanath Pratap Singh of Uttar Pradesh who resigned before he was asked to leave) were changed at the prime minister's whim.

36 Thus, despite extravagant promises to the contrary on the occasion of the centenary celebration of the Congress Party (December 1985), Congress(I) is yet to carry out inner party election at any level. It would appear that the party has become too sclerotic to submit itself to the upheaval of election.

APPOINTMENTS

cerned the manner in which N Sanjiva Reddy was thought to have handled the question of whether or not Jagjivan Ram should be invited to form a government when Desai lost a confidence vote in Lok Sabha (1979). The second concerns the major difference of opinion over the role of the president between prime minister Rajiv Gandhi and president Zail Singh (1986-1987). See for example the article entitled 'The President: Deepening Crisis' in *India Today*, May 31, 1987, p 27.

38 See, for example, Achin Vanaik, 'The Indian Left', *New Left Review*, September/October 1986, No 159, pp 49-70.

39 See R Rajagopalan, 'Background to India's State of Emergency', *The Black Liberator* 2 (January 1975-August 1976): 4, pp 313-319.

40 See Arun Shourie, *Symptoms of Fascism*, New Delhi: Vikas, 1978.

41 In Kerala and West Bengal, as well as in certain parts of Andhra Pradesh where CPI had long been active in the countryside, rich peasant domination was limited by comparison with that in states such as Uttar Pradesh.

42 These parties generally championed different caste members of the rural rich classes. Thus, in Bihar, the Lok Dal championed the cause of the lower of the four landowning castes (the upper ones being served by the Congress Party), whilst in Andhra Pradesh the Telugu Desam Party reflects on balance the interests of the Kamma landowning caste.

43 Even during the brief periods during which they were in office (1967-69 in certain states, 1977-80 in the centre, and since 1982 in certain states), non-left regional parties have shown themselves to be incapable of or unwilling to address the problems of the poorer peasantry and landless labour. Of special interest is the role played by DMK and AIADMK in Tamil Nadu where, during the last twenty years the content of politics has been systematically *lumpenised* as a consequence of the indifference with which the state government deals with the democratic demands of the agricultural poor.

44 During the Emergency, the Congress president (Deb Kanta Barua) earned notoriety by making the statement 'India is Indira and Indira is India', a slogan which he was to rue after the Emergency ended.

45 See note 36.

46 For example, Lalit Narayan Mishra (mysteriously killed in Samastipur in 1974), Chief Minister A R Antulay of Maharashtra, and Kamalapathi Tripathi (until recently the 'working president' of the Congress(I) Party). Even before Indira Gandhi became prime minister, money politics was introduced in a substantial manner by S K Patil, a member of the Congress 'Syndicate'.

47 See, for example, Rajni Kothari, 'The Non-Party Political Process', *Economic and Political Weekly* 19 (February 4, 1984): 5, pp 216-224; 'Will the State Wither Away?', *The Illustrated Weekly of India*, July 8, 1984, pp 8-14; D L Sheth, 'Grassroots Initiatives in India', *Economic and Political Weekly* 19, February 11, 1984: 6, pp 259-262.

48 New organisations were established for the promotion of the democratic rights and civil liberties of the people. These have remained active since the end of the Emergency (e g, PUCL and PUDR).

49 During the Emergency, Sanjay Gandhi, the prime minister's son, led such elements.

50 In an interesting discussion, Sudipta Kaviraj argues that as power has accumulated in the Indian state, paradoxically, institutions designed to safeguard democratic functioning of the state have weakened. In this author's view, this disjuncture between the power of the state and the institutions of democratic rule has in no way undermined the ordinary people's faith in parliamentary institutions and civil and democratic rights for the citizens or even the preference shown by the powerful classes to cling to the rule of the civil constitution in times of crisis. See Sudipta Kaviraj, 'On the Crisis of Political Institutions in India', *Contributions to Indian Sociology (New Series)* 18 (1984): 2, pp 223-243.

51 T V Sathyamurthy, 'India since Independence: A Research...', op cit.

52 With the exception of Jayaprakash Narayan who acted as a peacemaker between the querulous partners of the Janata leadership, all the others were busily engaged in publicly undermining each other. Thus, prime minister Morarji Desai, home minister Chowdhury Charan Singh and deputy prime minister Jagjivan Ram were always at odds with one another. The Janata coalition did not need an enemy to destabilise it. It acted as its own worst enemy. Within eighteen months, a formidable parliamentary majority was whittled down and the ruling coalition had disintegrated into two or three mutually hostile coalitions bent on destroying the government.

53 The prime minister of the Janata government and deputy prime minister Jagjivan Ram (as well as Chowdhury Charan Singh) were reared in the same political tradition as their predecessors in office whose view of centre-state relations was cast in the unitary rather than in a loose federal mould.

54 Upon its receiving a big majority in the 1977 election, the Janata government dismissed a number of state governments where Congress was in power. This controversial decisions, which was sustained by the Supreme Court, was followed by state assembly elections in a number of states. In several states Janata coalitions took power. In West Bengal and Tripura CPI(M)-led United Left Front coalitions received substantial majorities. In Kerala, which went to the polls at the time of the parliamentary election (March 1977), electoral choice had gone against the grain of the rest of the country and a Congress-led coalition won by a narrow majority.

55 For example, Andhra Pradesh and Karnataka (and to a lesser degree Maharashtra).

56 Characteristically, the Congress-led Andhra Pradesh government blamed the central government for failing to come to its rescue when the state was faced with famine, floods, drought and other disasters.

57 A SAD-led government was formed in the Punjab; the AIADMK government of Tamil Nadu had a big majority in the Tamil Nadu legislative Assembly.

58 For example, questions relating to the method and criteria of allocation of resources for development, and how the interests of the regional classes and social groups represented by the new parties in control of federal and state power should be presented.

59 It consists of the prime minister and the chief ministers.

60 With the exception of the brief interregnum (1964-66) when Lal Bahadur Shastri was prime minister.

61 Jammu and Kashmir has a Constitution of its own. Its special status is recognised in Article 370 of the Indian Constitution. See Roop Kishen Bhatt, 'Kashmir: The Politics of Integration' in Iqbal Narain (ed), *State Politics in India* (Meerut: Meenakshi Prakashan, 1976), pp 146-176; for a recent analysis of political changes in that sensitive state, see Balraj Puri, 'Fundamentalism in Kashmir, Fragmentation in Jammu', *Economic and Political Weekly* 22, May 30, 1987 22, pp 835-837.

62 In many instances, as in the case of Telugu Desam, for example, the political forces that arise out of these movements reflect the interests of narrow segments of the population.

63 For example, Jarnail Singh Bhindranwale's emergence as a leader of the fundamentalist Sikh mass could not have been smooth and sudden without the collusion of Zail Singh, one of Indira Gandhi's closest followers.

64 The Janata government was brought down in July 1979. In a series of moves in which Indira Gandhi, president Sanjiva Reddy, Chowdhury Charan Singh and Raj Narain were involved, Jagjivan Ram who could have formed an alternative government under Janata was sidelined. Charan Singh formed a government which was toppled in a fortnight.

65 T V Sathyamurthy, 'India's Punjab Problem: Edging Towards a Solution?', *The World Today*, March 1986, pp 46-50.

66 'Mizoram: Vote of Hope' (editorial), *Economic and Political Weekly* 22, February 28, 1987, 9, p 347.

67 The internal dialectic of the Indian ruling class was reflected in a deepening of the horizontal divisions within it. Janata was simply a political reflection of the impasse which had been reached earlier during the decade (1972-77) in the intra-ruling class relations between the national industrial capital and the agricultural rich.

68 See T V Sathyamurthy, 'Centre-State Relations: A Pre-Election Reckoning', *Economic and Political Weekly* 19 (September 29, 1984): 38, pp 1692-1695.

69 The industrial policy of the government under George Fernandes and its agricultural policy under Barnala (and Charan Singh) reflected the conflictual nature of the relations between the rival segments of the bourgeoisie. See Charan Singh, *India's Economic Nightmare* (Delhi: Allied, 1981)

70 Under the first five five-year plans, state policy gave great emphasis to heavy indus-

try which the national industrial bourgeoisie could not be expected to develop out of its own capital resources. See Ranjit K Sau, *India's Economic Growth: Constraints and Prospects* (Calcutta: Orient Longman, 1973) for a background to these developments.

71 See, for example, Ashok Mitra's three part essay entitled 'The Legacy of Indira Gandhi', *The Illustrated Weekly of India* (December 15, December 22, 1985 and January 5, 1986).

72 See, for example, Achin Vanaik, 'The Rajiv Congress in Search of Stability', *New Left Review* (November/December 1985): 154, pp 55-82 (especially pp 55-70 and 76-77).

73 T V Sathyamurthy, 'Piloting...', op cit.

74 During the 1982-83 period, Abdullah had been a key opposition chief minister who mustered support for a sustained agitation of the states against the centre. In the event, his government was toppled by Congress(I) machinations which resulted in detaching a clique led by Abdullah's brother-in-law (G M Sadiq) from NC. Overnight the government of Jammu and Kashmir changed hands and G M Sadiq became chief minister dependent upon Congress(I) support in the state legislative assembly.

75 Since 1982, Telugu Desam in Andhra Pradesh and Janata in Karnataka appear to have consolidated their position by winning two successive state assembly elections. In the former case, the clumsy effort to topple a popular government gave rise to mass protest of unprecedented intensity spreading far beyond the boundaries of Andhra Pradesh (1984).

76 T V Sathyamurthy, 'Piloting A Nation.', op cit.

77 The existence of such a large number of legislators belonging to a party exclusively devoted to the interests of the rich and middle peasantry (even though the party has been subject to numerous splits based on personal rivalries among the leaders and particularly on the question of who should succeed Chowdhury Charan Singh as party leader) is itself a factor contributing to the instability of the Congress(I) majority and to increased dissidence within the ruling party.

78 With S B Chavan as chief minister and Sharad Pawar, the Congress(S) leader and influential spokesman of the agricultural lobby, back in Congress(I) a brief respite has been gained in the conflict between different segments of the dominant elements of Maharashtra political economy. But it is more than likely that within a brief period of time the struggles which have persisted in Maharashtra since the mid-70s will resume.

79 Even in regional parties such as AIADMK and Telugu Desam which depend upon the charisma of a single leader, a semblance of local democracy is observed either in the party organ or in the election of local authorities with a modicum of devolution.

86 T V Sathyamurthy, *Nationalism in the Contemporary*... op cit, Chapters 2 and 3.

87 T V Sathyamurthy, 'Problems in Punjab' (an essay in three parts), *The Statesman* (Calcutta and Delhi: December 12, 13 and 14, 1983); 'Punjab: The Real Problem', *The Illustrated Weekly of India* (Bombay: March 4, 1984), pp 36-43.

88 See, for example, Special Feature on 'Haryana: A Fortress Besieged', *India Today* 12 (May 16-31, 1987): 10, pp 38-43.

89 The Haryana state legislative assembly election, along with the West Bengal and Kerala polls, were held (June 17, 1987) in the expectation that a spectacular victory in it would enable the centre to retrieve its fast eroding popularity. The main contenders were the Lok Dal(B) led by Chaudhury Devi Lal, a senior opposition figure representing the interests of the *kulaks* and the middle peasantry (joined by the largely urban-based BJP) on the one side, and by Congress(I) on the other (joined in a *marriage de convenance* by a Lok Dal splinter purporting to represent the interests of the Chowdhury Charan Singh dynasty). Even although the Haryana opposition parties' campaign started on local issues in general, and on the divergence and conflict of interests between Haryana and the Punjab, it soon fanned out to issues of national importance on which the Haryana electorate was called upon to pronounce a verdict. The latter included the corrupt and authoritarian behaviour of the centre bedevilled as the ruling party then was by a mounting catalogue of scandals reaching well beyond the pale of national politics into the international arena. Of particular importance to the main thesis argued in this discussion is the importance attached by Chaudhuri Devi Lal, during the election campaign, to rich and middle peasant interests. This was reflected in his attack against the central government's modernisation policies, which he sometimes couched in 'rural versus urban' terms and on other occasions in terms of a conflict between the western oriented upper class minority and the mass of the people! (See, for example, the editorial, *Economic and Political Weekly*, Vol 22, No 25, June 20, 1987, p 959.) The significance of this state assembly election thus went far beyond the confines of the Punjab versus Haryana issue. One of the main planks of the platform of the Lok Dal(B) election campaign consisted of a promise to write off all loans under Rs 15,000. In fact, it even threatened, albeit for brief moment only, to add to the uncertainty prevailing in the constitutional conflict then still under way between the prime minister and the president (Zail Singh); for, were the opposition to win a decisive victory in one of the heartland states, there could well be a concerted effort on the part of the non-Left opposition parties to provoke a split within the ruling party by making use of the presidential election that was due to take place in July 1987. The spectacular victory won by Lok Dal (B)-BJP alliance even exceeded the 1977 victory of the Janata Party in Haryana. Devi Lal's *nyaya yatra* thus ended in the coalition led by him winning more than 75 per cent of the total seats, with Lok Dal(B) itself winning a clear majority in the assembly. Congress(I)'s defeat in Haryana may thus be said to have increased the chances of its future in the rest of the heartland being problematic during the interval between the Haryana state assembly election and the ninth general election due in 1989.

90 See, for example, Special Report on 'Haryana Election Analysis: A Delicate Balance', *India Today*, 12 (June 1-15, 1987): 11, pp 32-34.

91 West Bengal returned the Left Front to power with an enhanced majority (and a majority for the CPI(M) component); Kerala returned a Left Front coalition to power, defeating the United Democratic Front which, under the leadership of Congress(I) held power from 1982 to 1987; Jammu and Kashmir returned the National Conference under Abdullah's leadership to power. NC fought the election with the support of Congress(I).

92 *Seminar* issues specially devoted to the Punjab, entitled 'The Punjab Tangle' (February 1984, No 294) and 'Punjab Perspectives' (October 1986, no 326) deal with this aspect of the Punjab crisis in several contributions.

93 See T V Sathyamurthy, *Nationalism in the Contemporary*..., op cit.

94 Ibid, Chapter 8.

95 During the 60s and 70s, when Assam's importance to the Indian economy rose with the sinking of oil wells, massive influxess of Bengalis from East Pakistan = Bangladesh continued, variously estimated at one to two million. By 1973, the proportion of indigenous Assamese to the total population of the state had dropped to less than 50 per cent.

96 Along with a section of the tribal population, tea garden workers as well as other non-Assamese people living in the Barak valley of lower Assam.

97 By 1979 (November), popular discontent in Assam with the centre crystallised around two student organisations—the All Assam Student's Union (AASU) and the All Assam Gana Sangram Parishad (AAGSP). Between them, the two organisations were able to bring public life to a complete halt for prolonged periods. Their challenge to the centre with the support of the mass of the Assamese people belonging to different socio-economic groups was at times reminiscent of the May 4, 1919 Movement in China.

98 In one area (Nellie) alone, many hundreds were massacred on election day. The boycott called by the Assam students in Assamese constituencies had been so successful that in one parliamentary constituency only 11 electors turned up to cast their votes on election day!

99 Under it, the centre undertook to ensure that all illegal immigrants who entered the state during the 1961-71 period (especially 1966-71) would be disenfranchised (though they might be allowed to stay in the state) until 1995, and to expel those immigrants who had illegally entered Assam across the porous Bangladesh border after the cut-off date of March 25, 1971.

100 AGP contested 117 &out of a total of 125Assembly seats and 11 &out of 12 Lok Sabha seats. It won 64 Assembly seats &Congress&I 2 5ànd seven Lok Sabha seats &Congress&I 4 : The United Minorities Front &UMFwhich broke away from Congress&I &because of its opposition to the Assam Accordwon 17 Assembly seats and one Lok Sabha seat. AGP, Congress&Iànd UMF gained 35 per cent, 23.4 per cent and 11 per cent of the total votes polled respectively.

101 See, for example, Udayon Misra, 'Assam: All Assam Students' Union—Crisis of Identity', *Economic and Political Weekly*, 22 (March 28, 1987): 13, pp 535-536. The loss of momentum has been further exacerbated by the economic problems caused by the recent floods (August-September 1987). See, for example, 'Assam: Some Boeing, Some Flying', *Economic and Political Weekly*, 22 (September 5-12, 1987): 36 and 37, pp 1515-1516.

102 Two genres of opposition have thus developed—one, opposition in the form of states governed by parties/coalitions opposed to Congress(I) and the other in the form of internal opposition in agriculturally important states from rich and middle peasant classes irrespective of whether their supporters vote Congress(I) or one of the peasant parties. The former has now become so entrenched that they express opposition to the centre in a more or less concerted form through periodic meetings of chief ministers of non-Congress(I) states (Madras, Vijayawada, Calcutta, Srinagar, Bangalore during the 1980-84 period, and Delhi in April 1987). See, for example, this author's 'Southern Chief Ministers' Meeting', *Economic and Political Weekly*, 18 (April 9, 1983): 15, pp 576-579; Sumit Chakravarty 'Meeting of Chief Ministers', *Mainstream*, May 2, 1987, pp 3-4, 34.

103 The crisis in the relationship between the president and the prime minister (1986-87) is without precedent and holds a portent of deep potential significance for the Indian Constitution and its political expression. No clear analysis has yet appeared about its nature and import, but a number of thoughtful observations have been published all the same. See, for example, Prabhu Chawla, 'The President: Deepening Crisis', *India Today*, May 31, 1987, p 27.

104 Recent developments, not only in the states lying outside the heartland but also in the heartland states such as the Punjab, Haryana and Uttar Pradesh would point in this direction. Furthermore, the general drift of the political implications of the main findings of the Sarkaria Commission report, the twists and turns in the political processes underlying the consolidation of national opposition to Congress(I) around the National Forum (which includes regional and central opposition parties) in general and the Janata Dal (embracing different centrist parties of the national opposition) in particular, and last but not least, the tendencies evidenced by the results of the elections to the state legislative assemblies of Tamil Nadu, Nagaland and Mizoram in January 1989, would seem to contain intimations of the heralding of a new era in centre-state relations on the eve of the next decade.

NOTICE

It is hereby notified for the information of the public that **ZUARI AGRO CHEMICALS LIMITED** proposes to make an application to the Central Government in the Department of Company Affairs, New Delhi, under sub-section &2) of Section 22 of the Monopolies and Restrictive Trade Practices Act, 1969 for approval of the establishment of a new undertaking/unit/division.

Brief particulars of the proposal are as under:-

1. Name and address of the applicant : **ZUARI AGRO CHEMICALS LIMITED**
   Jai Kisaan Bhawan,
   Zuarinagar,
   Goa 403 726.

2. Capital structure of the applicant organisation : The capital structure of Zuari Agro Chemicals Ltd. is as under:

	Rs. in lakhs	Rs. in lakhs
Share capital Authorised		
1,27,50,000 equity shares of Rs. 10/- each	1,275	—
4,25,000 redeemable cumulative preference shares of Rs. 100 each	425	1,700
Issued and subscribed:		
1,24,26,400 equity shares of Rs. 10/- each fully paid up	1,242.64	
4,02,180 15% redeemable cumulative preference shares of Rs. 100 each fully paid up	402.18	1,644.82
Add: Paid up amount on forfeited shares		.06
		1,644.88

3. Management structure of the applicant organisation indicating the names of the Directors, including the Managing/wholetime Directors and Manager, if any : ZUARI AGRO CHEMICALS LIMITED.
   The Company is managed by a Board of Directors comprising of the following Directors:
   Mr. K, K. Birla, Mr. C. A. Corry (Alternate: Mr. S. Y. Rege), Mr. R. P. Fitton (Alternate: Mr. C. H. Pardiwala), Mr. S. Gopalan (IDBI nominee), Mr. E. F. Guna (Alternate: Mr. D. B. Engineer), Mr. D. M. Laws (Alternate: Mr. H. C. Asher), Mr. M. D. Locke &Alternate: Mr. A. R. Wadia), Mr. D. P. Mandelia (Alternate: Mr. R. Maheshwari, Mr. S. V. Muzumdar, Mr. R. C. Wortley.
   Manager: Mr. R. Kapoor.

4. Indicate whether the proposal relates to the establishment of a new undertaking or a new unit/division : The proposal relates to establishing a new undertaking

5. Location of the new undertaking/unit/division : Zuarinagar, Goa 403 726

6. Capital structure of the proposed undertaking : The proposed undertaking will be a part of the applicant company whose capital structure is given at &2) above

7. In case the proposal relates to the production, storage, supply, distribution, marketing or control of any goods/articles, indicate:
   i) Name of goods/articles : Hydrogen Peroxide
   ii) Proposed licensed capacity : 5000 Ts.p.a. (100% W/W)
   iii) Estimated annual turnover : Rs. 27.0 crores

8. In case the proposal relates to the provision of any service state the volume of activity in terms of usual measures such as value, income, turnover, etc. : Not Applicable

9. Cost of the project : Rs. 45 crores

10. Scheme of finance, indicating the amounts to be raised from each source : Internal resources Rs. 15 crores.
    Term loan and/or debentures Rs. 30 crores.

Any person interested in the matter may make a representation in quadruplicate, to the Secretary, Department of Company Affairs, Government of India, Shastri Bhawan, New Delhi within 14 days from the date of publication of this notice, intimating his views on the proposal and indicating the nature of his interest therein.

For **ZUARI AGRO CHEMICALS LIMITED**

B. B. SHARMA
COMPANY SECRETARY

Dated the 2nd day of September 1989.

Tertiary Sector and Net Material Product
Indian Economy, 1950-51 to 1983-84

Madhusudan Datta

This paper argues that there has been no significant difference between the rates of growth of NMP and NDP for the Indian economy. This has been so in spite of the rapid growth of the tertiary sector. In this context the paper briefly analyses the implications of the rapid growth of distributive trade and transport services for NMP. The author also takes a quick look at the growth of the services rendered by 'Public Administration and Defence', which are excluded from NMP.

I

THE rapid growth of output of the tertiary sector in the Indian economy over the plan period naturally raises questions regarding the significance of the phenomenon. Some economists hold the view that the net domestic product becomes a misleading indicator of eocnomic progress of a poor country if the tertiary sector grows rapidly (Chandra, 1982). The point, however, has seldom been clearly elaborated. It has sometimes been argued (Katousian, 1970) that the rapid growth of public administration in most less developed countries is not always dictated by concern for economic progress. If we grant the above argument, a part of the output of the tertiary sector may be considered as having no contribution to the growth potential of the economy. While it is difficult to arrive at a precise estimate of this part, it is in all probability only a small fraction of the total output of the tertiary sector. But, for this reason, should one consider the rapid growth of the tertiary sector as a whole, undesirable? Or, more specifically, should one consider the rapid growth of transport, trade and bank services in the Indian economy as undesirable?

The present paper examines the above questions in the background of a study of the growth of net material product in India over 1950-51 to 1981-82. Section II of the paper briefly discusses some aspects of the notion that NMP is better than NDP as an indicator of economic progress of an LDC. In this context, the next section shows how the growth of distributive trade in India is intimately linked with the growth of material production. Sections IV and V examine respectively the growth of different sub-sectors of the tertiary sector and its implication for the relative growth of NMP and NDP of the Indian economy over the reference period. Section VI takes a critical look at the growth of the sub-sector 'Public Administration and Defence', which is excluded from NMP, over the reference period. The last section summarises the major findings of the study.

II

The most cardinal needs of the masses of a poor country, food, clothing and shelter, are all material goods. Further, capital goods required for the generation of productive capacity are also material goods. Consumption services[1] do not play a direct role either in the maintenance of the population or in the rapid growth of the economy. It is from this consideration that some economists have viewed the rapid growth of the tertiary (or services) sector in India as rather undesirable, and they have suggested that NMP should be considered as more meaningful than NDP as an index of economic progress of an LDC.[2]

The point that is often missed is that the value added in the tertiary sector does not constitute the difference between NDP and NMP. NMP is the unduplicated aggregate value of material goods produced in an economy. It is important to note that a large part of the value-added in the tertiary sector is incorporated into the value of material goods.

Let us elaborate the point. In the Material Products System (MPS) the whole process extending from extraction of resources from nature to their processing and distribution to the final users is considered as 'production' (UNECE, 1959). Obviously, distributive trade and the major part of transport services constitute part of material production. The rationale for the popular distaste for trade in India arises from the resentment against the cornering and hoarding of goods and of blackmarketing and profiteering as a result of such cornering. It needs to be remembered in this context that incomes arising from such activities do not in any case enter into the official estimates of the net domestic product. A large part of services under the category 'finance, credit and insurance' is also included in material production and, hence, NMP.[3] We will see below that the above services constitute the major part of the tertiary sector of the Indian economy. While the requirement of the above services per unit of material production depends, to some extent, on the pattern of industrial organisation, we may say that the above services are generally complementary to material production. Before we explain this point in the next section by taking the example of the growth of trade services in India over the plan period, we will contend below that geographical specialisation of production, leading to higher requirement of transport services per unit of product, does not distort the significance of NMP (at constant prices) as an index o material production of a country.

Let us consider the hypothetical case o a country with two regions—A and B— thousand miles apart. Let, in situation I both the regions be just self sufficient, s that there is no trade between the two. Nov let in situation II, region A specialise i agriculture while region B specialises i manufacturing. Suppose, as a result, th volume of both agricultural and manufacturing products going to final users just double. Then NMP at constant prices in situation II should be twice that in situation I Of course, one has to remember that a precondition of this specialisation (and the consequent doubling of output) is the existence of transport and trade. Such services thus facilitate the growth of output. In situation II a lot of goods have to be transported between the two regions. This adds a new element to the overall cost (and therefore the price) of the products. It may be noted that in the new situation prices of products may move either way depending on factor prices, irrespective of any economy of scale and even without the additional transport cost. Here we simply assume that prices of all goods rise by 10 per cent because of the additional cost on this account. Thus in situation II NMP at current prices rises by

TABLE 1: INTERMEDIATE TRADE PER UNIT OF VALUE ADDED IN MAJOR SECTORS

(percentages)

Year (1)	Primary Sector (2)	Secondary Sector (3)	Services Sector (4)
1968-69	1.28	23.12	1.91
1973-74	1.32	23.44	2.53
1979-80	2.89	42.00	3.93

Note: Coefficients for 1979-80 appear to be non-comparable with those of the two other years. Relative magnitudes of the coefficients for all the three matrices, however, seem to be comparable.

Sources: i) Central Statistical Organisation [1978 and 1981], 'Input-Output Transactions' for 1968-69 and 1973-74, *National Accounts Statistics*.
ii) Planning Commission [1983], 'Input-Output Transactions, 1979-80', *A Technical Note on the Draft Sixth Plan*.

something close to 120 per cent compared to that in situation I, assuming the inputs to be only marginal. Clearly, a part of this growth is illusory; transport services are incorporated into material goods the volume of which has increased by just 100 per cent. When current price NMP is deflated for the price rise, we obtain constant price NMP in situation II as just double that in situation I. Had the transport margin been higher the share of transport services in the value generated in material production would also be higher; but that would, nevertheless, leave constant price NMP at just double the level of that in situation I. Thus the rapid growth of transport service (and, by the same logic, other material services) does not distort the significance of NMP as an index of 'material progress' of a country (refer in this context to Chandra, 1982, p 530). The relevance of the above example for the development of the Indian economy is obvious. Now-a-days a lot of foodgrains is transported from Punjab and Haryana to distant parts of the country, but this was not the situation during the 50s or the early 60s.

III

In order to understand the complementarity between distributive trade and material production we would divide trade services into two parts—intermediate trade and final trade. Intermediate trade is related to trade in material inputs of production while final trade is related to trade in final goods. In India, the share of distributive trade in NDP at factor cost increased roughly from 8 per cent in 1950-51 to 12 per cent in 1983-84. Rough calculations based on the input-output transactions matrix of the Indian economy (Central Statistical Organisation, 1978) for 1968-69 shows that the aggregate value added in trade services was almost equally divided between its two parts.

It would be useful to indicate the CSO method of estimation of constant price value added in trade services before we go into the explanation for its growth. The estimate for the benchmark year (1970-71) is obtained on the basis of detailed surveys (though the geographical coverage of these surveys is not complete). Annual constant price estimates for different years are obtained by blowing up the benchmark estimate by *volume indices* (which are nothing but aggregates of constant price values) *of commodities handled by traders* in the respective years. Clearly the CSO estimates of value added in trade discount for not only the rise in prices of commodities but also for secular changes in trade margins for different commodities.[4]

We may now trace the link between trade and material production in the Indian economy over the reference period. We note that material input (and hence intermediate trade) requirement per unit of value added is not the same in all branches of production. Table 1 shows that intermediate trade coefficient for the secondary sector is many times higher than those for the primary and the tertiary sectors during all the three years for which observations are available. We also know that over the decade starting from the mid-1950s the share of the secondary sector in GDP at factor cost (at 1970-71 prices) increased rapidly—roughly from 14 to 22 per cent. Thereafter, this share remained stagnant. This relative expansion of the secondary sector must have raised the share of intermediate trade in NDP. Apart from the relative expansion of the secondary sector another factor also worked to raise the share of intermediate trade in NDP. The value of material input per unit of the value of output in almost all the branches of registered manufacturing sector increased over the decades of the 60s and the 70s (Table 2, data for the 50s are not available). This, obviously, led to an increase in the intermediate trade coefficient for the secondary sector over the period concerned. This observation is supported by Table 1, though the extent of the increment in the coefficient between 1973-74 and 1980-81, as shown by the table, may not be fully explained by the above phenomenon.[5]

We may now briefly consider the behaviour of the share of final trade in NDP. A change in the composition of commodities for final use should affect the final trade share. It has been observed (Datta, M, 1988 pp 37-41) that while only about one-third of the total demand for foodgrains is distributed through traders, the corresponding proportion for non-food final material

TABLE 3: VALUE OF FOODGRAINS AND NON-FOODGRAINS FINAL MATERIAL GOODS* AS PERCENTAGES OF GROSS DOMESTIC PRODUCT (AT MARKET PRICES OF 1970-71)

Year	Foodgrains	NFM**	Ratio Col 2: Col 3
(1)	(2)	(3)	(4)
1950-51	34.0	43.3	44:56
1955-56	33.2	44.4	43:57
1960-61	31.0	46.2	40:60
1965-66	26.1	48.4	35:65
1970-71	27.0	48.8	36:64
1975-76	25.2	49.5	34:66
1980-81	22.0	51.2	30:70
1983-84	20.0	53.4	27:73

Notes: * The table gives only rough estimates. The value of non-foodgrains final material goods has been approximated by deducting from GDP values of foodgrains and consumption services which include passenger transport, consumption of electricity, real estate, 'public administration and defence' and other community and personal services.
** NFM = Non-foodgrains final material goods.

goods is considerably higher. Therefore, a gradual decline in the share of foodgrains in total value of final material goods (Table 3) would tend to raise the share of final trade in NDP. This influence, however, might be offset if the share of final material goods itself in the aggregate value of all final goods and services (GDP) declined rapidly.

Table 4 shows that value added in consumption services as a proportion of GDP at factor cost increased[6] rather significantly only over the last one decade of the period under study. But for the whole period under study, clearly, the decline was not sharp enough to offset the positive influence on the final trade share caused by sharp decline in the proportion of foodgrains in final material goods. So, it appears that the final trade share in NDP increased in India as a result of the change in the composition of final demand.

We conclude from our discussion in the present section that the increment in the share of trade in NDP at constant prices in India over the period 1950-51 to 1983-84 was caused by changes in the sphere of material production. These changes relate to the structure of final demand and the related industrial structure of the economy.

IV

In India the share of the tertiary sector in NDP at factor cost (at 1970-71 prices) increased from 24.2 per cent in 1950-51 to 37.9 per cent in 1983-84 (Table 5). During this period the sub-sector 'Trade, Hotels and Restaurants' contributed about one-third[7] of the value added in the sector. 'Transport and Communications' was another major sub-sector. Throughout the reference period this sub-sector accounted for about one-sixth of the income originating in the tertiary sector. A smaller but very rapidly growing sub-sector was 'Banking and Insurance'; its contribution to the value added in the tertiary sector increased from just 3.9 to 7.9 per cent over the reference period. We observe from the table that the combined share of the three above sub-sectors was roughly per cent of the aggregate value added in t tertiary sector.

The two sub-sectors, 'Dwellings R Estate, etc' and 'Other Services' (compr ing miscellaneous personal and commun services) together contributed a little mo than one-third of the net product of the t tiary sector in 1950-51, but the share steadi declined to reach a low of just one-fifth 1983-84. The share of 'Public Administr tion and Defence' (PA and D), on the oth hand, doubled—from 11.7 to 23.5 p cent—over the same period. We have alrea indicated that almost the whole of the val added in 'Trade, Hotels and Restaurant should be incorporated into NMP. As f transport services, it should, in principl be divided into two parts—goods an passenger transport. Income originating i goods transport should be wholly include in NMP. But the treatment of passeng transport involves some problem. In an case, practical difficulties in making separat estimates for goods and passenger transpo has led most socialist countries to includ the whole of income generated from trans port into NMP. Similar remarks may als be made of income from communication services. Again, almost the whole of valu added in banking and a large part of tha from insurance services are included i NMP. Keeping the above points in view, w may suggest that over the period unde study, about half of the value added in th tertiary sector of the Indian economy, as rough approximation, formed part of NMP Clearly, even those who advocate the use o NMP, rather than NDP, as an index o 'economic progress' cannot hold the rapi growth of the tertiary sector of the India economy as entirely undesirable.

V

In view of the above discussion it should be interesting to study the relative growth of NMP and NDP of the Indian economy over the reference period. We have computed three series of estimates of NMP for the Indian economy—one at current prices and two at constant prices. The disaggregated tables of NDP as given in CSO publications have been used to derive these estimates. Our estimates do not exactly conform to the UN guideline for obtaining NMP from SNA data. This is because the breakdown of activities in the CSO data is not detailed enough for the purpose.

The most important source of divergence from the UN guideline is the inclusion of non-business related passenger transport in NMP. Other source of divergence are failures to determine the proportions, for communication and banking services,[8] which cannot be treated as inputs to material production. The whole of these services have been included in our estimates. Further, though the services of hotels belong to the non-material sphere, these have been included in our estimate because the CSO

(percentage distribution)

Year (1)	Trade, etc (2)	Transport, etc (3)	Banking and Insurance (4)	Public Adminis-tration (5)	Dwellings, Real Estate, etc (6)	Other Services (7)	Aggregate Tertiary Sector* (8)
1950-51	34.9	13.0	3.9	11.7	10.6	25.9	100(24.2)
1955-56	34.3	17.4	4.6	10.6	9.8	23.3	100(26.0)
1960-61	36.8	14.4	5.1	12.0	9.3	22.3	100(26.3)
1965-66	37.1	15.2	5.4	13.9	9.8	18.7	100(30.9)
1970-71	37.3	15.2	6.2	15.6	9.9	15.8	100(30.3)
1975-76	36.5	15.5	6.4	17.6	9.3	14.7	100(31.7)
1980-81	35.2	13.8	7.5	20.9	9.2	13.3	100(35.3)
1983-84	33.5	14.5	7.9	23.5	8.3	12.2	100(37.9)

Note: * Figures in parentheses show net product of the tertiary sector as percentage of NDP at factor cost.

Source: Central Statistical Organisation, *National Accounts Statistics*, January 1989, February 1982, and January 1986.

does not provide any separate estimate of value added in this sector. Thus our estimates have a small upward bias as compared to those one would obtain from strict observance of the UN guideline.

An important point regarding our estimates is that, unlike the general practice,[9] these are at factor cost. Since indirect tax revenue is raised mostly from material products, the share of NMP in NDP will be higher for market price estimates than for factor cost estimates. We may note that the former estimate unlike the latter one, will also reflect changes in the ratio of indirect tax revenue to NDP. Therefore, it appears that the factor cost estimates are more suitable for the study of relative growth rates of NMP and NDP.

Now we come to a comparison of our estimates of NMP with those of NDP presented by CSO. Table 6 implies that current price estimates of consumption services expressed as a proportion of NMP does not have any uniform trend over the first decade under study. This proportion shows a uniformly declining trend over the next fifteen years, the trend being reversed during the rest of the period under study. However, the constant price estimates roughly show a rising trend over the entire period under study (Tables 7 and 8), though this trend was comparatively weak during the 50s.

The trend, whether at currrent or at constant prices, was not sufficiently strong to make any substantial impact on the relative rates of growth of NMP and NDP (Table 9) except during the last few years when the Indian economy experienced a rather sharp increase in the share of services in NDP.[10]

Table 9 shows that over the three decades there was no significant difference between the growth rates of the two aggregates at current prices, however, that the growth rate of NMP (at constant prices) was marginally smaller than that of NDP. But it is not clear that the constant price estimates provide a more reliable picture particularly because the official method of estimation of value added at constant prices in PA and D is open to question. We will discuss this point in detail in the next section.

VI

Prior to the publication of its new series (with 1980-81 as base), the CSO obtained the constant price value added in PA and D from the current price estimates after adjusting the latter for allowances granted to employees specifically on account of rises in the cost of living (CSO, 1980). The implicit assumption in this procedure, obviously, is that increments in employees compensation, other than dearness allowances, represent rises in labour productivity. The above approach has been revised in the new series. The new approach is to deflate the current price estimates by the consumer price index for industrial workers (Datta Roy Chowdhury, U, 1988). This has led to a sharp decline in the rate of growth of value added (at constant prices) in the sector as compared to the growth rate in the old series (with 1970-71 as base). The new approach implies that any increment in real wage in the sector reflects productivity increment. Both the old and the new approaches may be particularly objectionable in view of the argument that increments in employees compensation in the sub-sector reflects increment in productivity in the industrial (technologically progressive) sector (Baumol, W J, 1967). Since value added in PA and D consists entirely of employees compensation, its increment, even when quite unrelated to productivity rise, leads to increment in value added in the sub-sector and also in NDP. In other activities, however, a wage hike does not generally lead immediately to commensurate increment in value added in the activity (because of uncertain response of prices and quantities), nor does the wage hike necesarily lead to an increment in NDP in real terms. This underlines the need for special caution in the estimation of value added in PA and D.

In fact, if we assume that productivity in government administration did not change over time, then in order to obtain the constant price value added in PA and D the index of money wage of government employees should be the appropriate deflator of current price value added. However, the assumption may not be entirely valid. Even if the average educational standard of government employees remains unchanged (though we do not have ready and reliable data on this) over the reference period, the efficiency in government administration should, perhaps, increase over time through experience (learning by doing?). A number of other factors also (e g, the use of modern equipment, the standard of ethics, etc) should influence the efficiency. Thus it is not easy to provide a ready solution to the problem of measurement of productivity in PA and D.

TABLE 6: NET DOMESTIC PRODUCT AND NET MATERIAL PRODUCT AT FACTOR COST (CURRENT PRICES)

In the absence of a better alternative, a simple way out may be to use the current price share of the sub-sector in NDP at factor cost for the corresponding share at constant prices. It may be said in defence of this approach that with economic growth while, on the one hand, the tax base expands, the demand for administrative services, on the other hand, also increases.[11] Thus in the course of economic development the government would be under pressure not only to enhance employees' compensation,[12] but also to expand administrative services. Therefore, the current price share of PA and D in NDP at factor cost may not be entirely devoid of a notion of the volume of services rendered by the sub-sector.[13] We have applied the method suggested above to estimate constant price value added in PA and D. Table 10 shows our estimates and the corresponding CSO estimates. We find that the share of PA and D in aggregate value added in the tertiary sector increased over the three and a half decades under study (col 5). But the increment is much less sharp than that shown by the corresponding CSO estimates (col 4). The difference between the two estimates may be seen from cols 2 and 3 of the table. Clearly, our estimates lead to a downward revision of constant price NDP at factor cost after 1970-71 and a slight upward revision before 1970-71. This means a marginal fall in the growth rate of NDP. Clearly, the above exercise implies that there is practically no difference between the rates of growth of NMP and NDP (at constant prices) over the period under study, if we make suitable adjustments to derive the net output of PA and D at current prices.

VII

We may summarise the major findings of the study as follows:

1 The growth of the tertiary sector at a rate higher than that of NDP does not necessarily imply the growth of NMP at a rate lower than that of NDP.

2 Certain services, like trade and transport, are complementary to material production. The growth of trade services in India over 1950-51 to 1983-84 has responded to changes in the structure of material production.

3 The official estimate of the rate of growth of value added (at constant prices) in 'Public Administration and Defence' in India has an upward bias. This has led to a similar bias in the official estimate of the corresponding growth rate for the tertiary sector.

4 A major part of the value added in the tertiary sector of the Indian economy constitutes a part of NMP. After some revision for the bias in the official estimates of value added in 'Public Administration and Defence' there is practically no difference between the rates of growth of NMP and NDP (whether at current or at constant prices) in India over the period covered by the study.

Notes

[The author is grateful to his teacher M K Rakshit for comments on various points discussed in the paper. He is also grateful to an anonymous referee for useful comments.]

1 By consumption services we mean those services which do not *directly* take part in the process of material production. Examples of such services are general government administration, defence, education, health, etc. The importance of such services in creating a healthy socio-cultural atmosphere is not in doubt. But the point here is that a rapid growth of such services may not be an essential condition for the rapid growth of an economy in its early stages of development cf Hunt, C L [1966].

Source: CSO, *National Accounts Statistics*, March 1975.

2 A detailed discussion of the relative significance of the two aggregates has been undertaken in Datta, M [1987].

3 We may note here that though a large part of the services of the category is included in NMP, the category itself is classified under the non-material sphere in the MPS, cf U N, 1971.

4 One problem with the CSO method is that it does not take into account the differences in trade margins for different commodities.

5 We may note that the sources of the two matrices for the years 1973-74 and 1980-81 are different. Therefore, the matrices may not be fully comparable.

6 We assume that the trend of value added reflects the trend of value of consumption service, also.

7 As per CSO estimates, about 8 per cent of this value added may be attributed to 'Hotels and Restaurants'.

8 Value added in life insurance has, however, been separated from that in other insurance business and the former has been excluded from NMP.

9 Communist countries present their estimates of NMP at market prices. CSO also has presented market price estimates of NMP for the Indian economy over the period 1970-71 to 1978-79. [Cf Monthly Abstract of Statistics, April 1982]. This is the first official series of NMP of the Indian economy. The first attempt in this field, however, is by M Mukherjee. He provides an estimate for the year 1948-49. Tewari, S G and Kanbur, M G also have computed a series for the period 1948-49 to 1961-62. Cf Mukherjee, M [1969].

10 Our finding is contrary to Nirmal Chandra's. He observed that per capita NMP was stagnant while per capita NDP had a steadily increasing trend over the period 1900 to 1975. His concept of NMP is not the official one and had he does not give a clear theoretical basis for his concept. Cf Chandra, N [1982].

11 Wagner's law Cf Wagner, A [1983]; Musgraves R A [1959], p 51.

12 We may note here that Baumol's [1967] hypothesis of 'rising cost of services' does not apply to the Indian experience relating to PA and D over the period concerned. Datta, M [1988], p 113.

13 The approach suggested above, in fact, implies the use of the NDP deflator and it gives a result close to that obtained by the revised CSO method.

TABLE 9: RATES OF GROWTH OF THE NMP AND THE NDP OF THE INDIAN ECONOMY

Period	Rates of Growth of	
	NMP	NDP
Estimates at Current Prices		
1949-50 to 1958-59	3.2	3.5
1959-60 to 1969-70	9.7	9.3
1970-71 to 1980-81	11.7	11.8
1949-50 to 1982-83	8.7	8.6
Estimates at 1960-61 Price		
1951-51 to 1960-61	4.0	4.0

Lakhanpal National

LAKHANPAL NATIONAL is proposing to expand its present installed capacity of 180 mn dry cells per annum by 120 mn dry cells per annum. The expansion has become necessary as the company's Baroda factory has been producing between 200 and 250 mn cells during the last four years against the licensed capacity of 180 mn cells. The company has obtained a licence for the expansion which will take the form of a new plant which has been set up at Pithampur near Indore. This is claimed to be the most modern battery manufacturing plant in the country, equipped with sophisticated quality control devices for manufacturing zinc chloride batteries. This plant will produce India's first zinc chloride penlite battery with a metal jacket, 'Novino Gold', which will last twice as long as ordinary batteries when used in heavy drainage equipment like photo flashes, electronic toys, walkmans, etc. The Pithampur factory is estimated to cost Rs 16 crore.

Lakhanpal National's unaudited financial results for the 12-month period ending March 31, 1989 shows sales (including excise) at Rs 61.24 crore compared to Rs 66.52 crore in the 15-month period from January 1987 to March 1988. Gross profit is estimated at Rs 2.74 crore (Rs 3.39 crore) and net profit after depreciation, taxation and investment allowance at Rs 1.06 crore (Rs 1.04 crore).

Net Foreign Exchange Earnings of Private Corporate Sector

Vidya Pitre

This paper is an empirical analysis of trends in foreign exchange earnings and expenditure of the private corporate sector over the period 1960-61 to 1987-88. It is based on data from the RBI Survey Reports on Foreign Collaborations and the RBI Studies on Finances of Medium and Large Public and Private Limited Companies and Foreign Controlled Rupee Companies. Three distinct phases are identified: (i) 1960-61 to 1972-73, (ii) 1974-75 to 1977-78 and (iii) 1978-79 to 1987-88, each characterised by a different set of policies, state of the industrial economy and foreign trade and payments situation.

FOREIGN investment in a wider sense denotes a spectrum of international arrangements ranging from a licensing agreement for use of a patent or trade mark to direct investment through branches of foreign enterprise. In essence this entails flow of capital and non-capital factors like technology from one country to another. Historically such a flow is not a new phenomenon but has assumed significance in the wake of the need of the developing countries to push up their growth rates.

In the framework of current economic theory the flow of international capital has been treated as an engine of growth. In the growth models, foreign investment has been given the role of gap filling. In most of the developing countries the rate of domestic saving is much less than the rate of domestic investment and the level of technology is much lower. Apart from this, developing countries are often in a situation of balance of payments deficits. Foreign capital is presumed to fill these gaps: saving-investment gap, technology gap and trade gap.

Consequently, import of foreign capital and technology is an important factor for initiating or accelerating the pace of industrial activity. Michael Kidron[1] undertook a very systematic study covering period up to 1961. Thereafter K K Subrahmanian[2, 3] had attempted a thorough and exhaustive analysis of the subject.

The development in this area may be viewed against the FERA—Foreign Exchange Regulation Act—which was passed in 1973. The objective of it was regulation of foreign ownership and foreign exchange transactions. It led some to believe that the conservation of foreign exchange was also one of the implied objectives. Sudip Chaudhuri[4] discussed at length the provisions of FERA guidelines and also probable impact on the corporate sector in India. It led him to the following conclusions: No inbuilt legal bias against foreign capital has been introduced through FERA. A section of the foreign corporate sector has in fact been excluded from the purview of the act. Further, the hold of foreign firms over Indian firms will be strengthened as a result of the implementation of FERA. Indian portfolio investors who participate in the share capital of foreign companies may benefit, but these benefits are likely to be limited if foreign firms now declare less dividends and repatriate a higher portion of profits through other measures, as for instance, transfer pricing. The foreign exchange outflow resulting from the expansion of foreign companies is likely to increase. Apart from pointing out the gap in the declared objectives of the legislation and actual results he highlighted some important features about FERA. According to Chaudhuri, foreign companies could gain by faithfully implementing the provisions of the act. Violations of the provisions by taking advantage of the loopholes or otherwise would not be necessary.

It is in this light that we propose to analyse the foreign exchange earnings/expenditure of corporate sector in India with a view to identifying the cost and benefit from the import of capital and technology. In doing so, only direct cost and benefit will be considered. J J Anjaria[5] in a foreword to the first survey report on foreign collaboration in Indian industry posed the problem thus: "A major problem in this field whether, on balance, foreign collaboration arrangements have resulted in or can be relied on to result in a net gain to the country. Clearly an answer to this question cannot be given on the basis of just factual data regarding dividends, royalties, technical fees and the like brought together in this report, since the problem involves among other things an assessment of what progress in production, employment, exports and advance of technology in general and of import substitution in particular would have been made in the absence of these arrangements for import of capital and technical know-how—a different kind of terrain altogether." This study also does not claim to have taken up such an exercise. It consists of an empirical analysis of the trends in the foreign exchange earning/expenditure over the period 1960-61 to 1987-88. The merit of this exercise lies in collection of data from different sources and building a consistent set of meaningful information. The main problem in building such a time series data from different sources is the differences in coverage, method and

Sources: Foreign Collaboration Surveys.

cope of the studies. Bearing these limitations in mind the data would be useful in giving a rough picture indicative of the underlying trend of net foreign exchange earnings of the corporate sector in India.

In the following sections the data and results are presented for each source separately. The main sources are RBI Survey Report on Foreign Collaboration in India and RBI Studies on Finances of Medium and Large Public and Private Limited Companies and Foreign Controlled Rupee Companies. For supplementary information and gaps we have also made reference to special studies done in this area. The last section contains the findings of each set of data and offers concluding remarks.

Foreign Collaboration Survey Reports, 1960-61 to 1980-81

As is well known foreign collaboration is an important aspect of industrial policy. The survey reports on foreign collaboration released by Reserve Bank of India are useful to make an assessment of the past pattern and emerging trend which is an important area where the government is making sweeping policy changes. The Reserve Bank has been conducting periodical surveys of foreign collaboration agreements in the corporate sector. These survey reports constitute the only comprehensive sources to provide factual material for analytical studies on the impact of import of capital and technology. The first survey covered a four-year period from 1960-61 to 1963-64, the second covered six-year period from 1964-65 to 1969-70 and the fourth survey spanned the four-year period from 1977-78 to 1980-81. The report of the third survey was not published. A summary of the results of the survey covering the three-year period 1970-71 to 1972-73 is published in the Appendix of the fourth survey. Through all the surveys the results are presented in the same format. This facilitates the construction of a continuous data set on financial aspects of foreign collaboration in corporate sector and enables us to examine the nature of these agreements. The period 1973-74 to 1977-78 is left uncovered. The omission of the period which witnessed the influence of some major policy changes has reduced the analytical usefulness of the continuous data that can be generated from the reports. Thus we have an authoritative account of some statistics of foreign collaboration in Indian industry with a four-year break. The data can be used to make a comparative study of the characteristics and incidence of different forms through which capital and technology transfers have taken place in response to government policy changes from time to time.

We may turn to the analysis of data in order to understand the basic underlying trend. Tables 1 and 2 set out the data on value of production, imports and exports of the Indian companies for the period 1960-61 to 1980-81. We observe a continuous and rising net outflow of foreign exchange during this period. Imports increased from Rs 205.4 crore in 1960-61 to Rs 363.2 crore in 1972-73. Exports increased from Rs 51.2 crore to Rs 225.4 crore in the same period. The deficit was of the order of Rs 137.8 crore in 1972-73 as against Rs 154.2 crore in 1960-61. The proportion of imports to production showed a sharp and continuous fall from 22.6 per cent in 1960-61 to 7.4 per cent in 1972-73. In the corresponding period, the share of exports remained the same or declined slightly. In that sense liberalisation or outward orientation does not emerge as the salient feature of this period.

In 1977-78 and 1978-79 we observe net inflow of foreign exchange consequent to higher growth in export *vis-a-vis* imports. The share of imports in production declined further while that of exports increased.

In 1979-80 there appears to be reversal of the trend with a sharp rise in imports. Over two years import bill increased from Rs 372.6 crore in 1978-79 to Rs 624.9 crore in 1980-81, giving an increase of 68 per cent. It thus appears that while exports as a proportion of total production hardly changed at all during the two years, there was a substantial increase both in the absolute amount and the relative proportion of imports during the two years. The foreign exchange balance of the private sector companies of the sector having foreign collaboration and/or equity participation thus turned from a small positive figure in 1977-78 to a large negative figure by 1980-81.

We may take up some other aspects of the problem as revealed through the survey reports. Value of production under foreign collaboration of private corporate sector rose from Rs 910.3 crore in 1960-61 to Rs 4906.0 crore in 1980-81. During this period the

Source: Same as in Table 1.

relative share of subsidiaries and pure technical collaboration companies declined from 41.9 per cent and 32.2 per cent to 20.4 per cent and 22.5 per cent, respectively. The share of minority companies increased sharply from 25.9 per cent to 57.2 per cent over the period. The share of foreign capital in total capital declined sharply from 52.6 per cent to 39.1 per cent. Fall in share of the subsidiary companies contributed largely to the decline. The lower degree of foreign control during the period reflected government's policy requiring foreign controlled companies to reduce the degree of foreign control over the companies as per FERA 1973. However, the absolute value of total foreign investment rose by Rs 45.6 crore over 1977-78 to 1980-81, recording a rise of 31.5 per cent.

During this period we observe that under foreign exchange payment the import bill constituted a very large proportion (97.61 per cent in 1960-61) as against 'other' expenditure. Further, its share also showed a rising trend over the period. As a result, in 1980-81 it accounted for about 99.17 per cent of total payment. The category of 'others' comprise payment of dividend, royalty, interest and technical fees. Dividend accounted for about 50 per cent of payment under 'others'. This is followed by interest and technical fees. Increase in dividend and interest payment is observed. Under imports raw materials constituted the important component, its share ranging from 70 to 80 per cent through the entire period.

Data for the Period 1974-75 to 1977-78

As discussed earlier, RBI surveys leave a gap of four years. For 1974-75 to 1977-78 a study comprising a sample of 153 companies provides useful statistics. The study by Zhaveri and Bhagirathi[6] analyses the export performance of 153 companies for the four years 1974-75 to 1977-78. In addition to examining trends in exports in relation to sales, an attempt is made to bring out the direct balance of payments impact of the 153 companies. These companies account for over 25 per cent of total paid-up capital of private corporate sector.

Taking the 153 companies as a whole, net foreign exchange earnings shot up from Rs 13.0 crore in 1974-75 to Rs 263.6 crore in 1976-77 and declined to Rs 148 crore in 1977-78. Thus this period witnessed a net inflow of foreign exchange earnings.

Foreign-Controlled Rupee Companies

Indian joint stock companies which are subsidiaries of foreign companies, companies in which 40 per cent or more of equity capital is held outside India in any one country and companies in which 25 per cent or more of the equity capital is held by a foreign company or its nominee are treated as foreign-controlled rupee companies (FCRCs). Historically in India foreign col-

1977-78	11.5	7.8
1978-79	12.1	8.2
1979-80	12.0	9.1
1980-81	10.9	8.8
1982-83	11.7	8.1
1983-84	10.9	7.1
1984-85	11.6	7.2

laboration was associated with branches of foreign companies and subsidiaries. In 1973, branches accounted for more than a quarter of the outstanding foreign private investment in India. Later, following the FERA, 1973, most of the branches converted themselves into Indian joint stock companies. Their share in the outstanding foreign private market investment declined steadily to 6.5 per cent as at the end of March 31, 1980.

It has not been possible to identify the original flow of equity which can grow through capitalisation of resources. As at the end of 1984-85 the reserves and surpluses of these companies amounted to Rs 1,338 crore as against Rs 754 crore of foreign equity. With the capitalisation of these, the foreign holding can go up.

For FCRCs value of production shows a rise from Rs 3,645 crore in 1975-76 to Rs 7,067 crore in 1984-85 (Table 4). These companies show a trend of net outgo on foreign exchanges account (Table 5). In 1984-85 the deficit was to the tune of Rs 15.2 crore. The share of exports has remained fairly constant. However, for subsidiaries, the results based on the foreign collaboration survey show net inflow of foreign exchange. This is taken as a consequence of industries complying with export stipulation norm laid down for retention of majority control. But this is not corroborated by findings of FCRCs. The large outgo thus can be attributed to companies holding 25 per cent or more foreign equity holding. The noteworthy feature of the financial performance of these companies is consistently higher level of profits *vis-a-vis* Indian controlled companies (Table 6).

Recently Nagesh Kumar[7] has made an attempt to provide estimates of foreign controlled enterprises in Indian manufacturing. The set of estimates suggests higher share in profits than in either sales or assets. The importance of FCRCs has declined in traditional industries like jute, cotton, textiles, paper, cement, etc. They, however, continue to hold high share in a number of industries producing consumer goods under brand names such as processed foods, cigarettes, leather goods, etc.

RBI Studies on Public and Private Limited Companies

In RBI studies on public and private limited companies, we find a detailed statement under the 'earning and expenditure in foreign exchange' presenting data on receipts and payments in foreign exchange for selected industries as well as for all industries. These are based on information published in the annual accounts. These data are required to be published following the notification in October 1973 by the Department of Company Affairs. RBI has been publishing consolidated data from 1976-77 regularly. With regard to coverage, reporting, etc, however, there are certain problems which are discussed below.

As regards foreign exchange expenditure, imports of raw materials, components and spares and capital goods, imports of goods purchased from established importer or canalising agency which are paid in rupees may not get reported under imports by the company. There is also possibility of advance payment for imports in later periods being included under this head. This will be particularly so in the case of capital goods imported and also with regard to other items like royalty, know-how, interest, etc. Thus here, what is reported is actual remittance and not actual transactions relating to the accounting period. As regards reporting under export and other items similar problems persist. In case of exports, some companies report data on exports of their products made through other parties including canalising agencies. Apart from that there is no uniformity in reporting data on imports and exports. This gets compounded by the fact that the figures of foreign exchange receipts and expenditure in individual accounts cannot be cross-checked with other items in profit and loss account. It is, therefore, somewhat difficult to ensure the same level of accuracy of the consolidated data as in the case of other items. The published accounts are broad data on receipts and payments in foreign exchange and not total earning and expenditure. Despite these limitations, the data on foreign exchange receipts and expenditure for all industries are expected to indicate broad trends in foreign currency transactions by the private corporate sector because of the fairly high coverage of private corporate sector activities that is available in these studies. The data on gross value of production, foreign exchange earning and expenditure for medium and large public and private limited companies and large public limited companies are presented in Tables 7-14.

The striking feature emerging at the outset is the consistency in the overall trend of net foreign exchange earning with the corresponding trend based on data in the foreign collaboration survey and findings of Zhaveri and Bhagirathi. The period 1975-76 to 1977-78 is characterised by net inflow of foreign exchange earnings. It declined to a modest surplus in 1978-79. This year constitutes a watershed in the sense that the earlier trend is reversed. A growing deficit in foreign exchange is the characteristic of the latter period. Towards the end of the period the deficit was of the order of Rs 144 crore. The percentage share of expenditure to production increased from 4.6 per cent in 1975-76 to 7.1 per cent in 1985-86. As against this the share of earnings declined steadily after attaining peak in 1976-77. It stood at 4.1 per cent in 1985-86.

We then proceed to examine the data a[t] a disaggregated level. The value of produc[tion] of all industries under medium an[d] large companies increased from Rs 248[6] crore in 1960-61 to Rs 48044 crore i[n] 1985-86. Cotton textiles (23.7), engineerin[g] (17.1) and others (28.7) are the important in[-]dustry groups in 1960-61. Over the perio[d] sharp increase in the production of engineer[-]ing and chemicals resulted in a shift in th[e] structure of output. The share of these tw[o]

ASIAN CABLES LIMITED

Registered Office: 'Ceat Mahal', 463, Dr. Annie Besant Road, Worli, Bombay 400 025

NOTICE

It is hereby notified for the information of the public that Asian Cables Limited proposes to make an application to the Central Government in the Department of Company Affairs, New Delhi, under sub-section (2) of Section 22 of the Monopolies and Restrictive Trade Practices Act, 1969, for approval to the establishment of a new undertaking. Brief particulars of the proposal are as under:

1. Name and address of the applicant	: Asian Cables Limited, CEAT MAHAL, 463, Dr. Annie Besant Road, Bombay 400 025.
2. Capital structure of the applicant organisation	: Authorised — Rs. 910 Lacs Issued/Subscribed & paid-up — Rs. 861.15 Lacs.
3. Management structure of the applicant organisation indicating the names of the Directors, including Managing/Whole-time Directors and Manager, if any,	: Asian Cables Limited is managed by its Managing Director Mr. M.A. Bakre The following are the Directors of the Company:- 1) Mr. M.A. Bakre 2) Mr. B.N. Adarkar 3) Dr. K.S. Basu 4) Mr. P.V.R. Rao I.C.S (Retd.) 5) Mr. S. Goenka 6) Mr. S.N. Bagla 7) Mr. J. Bague 8) Mr. T.J. White 9) Mr. A.T. Fletcher 10) Mr. T.N. Nagendra 11) Mr. V.N. Nadkarni 12) Air Chief Marshal I.H. Latif 13) Mr. D.J. Balaji Rao
4. Indicate whether the proposal relates to the establishment of a new undertaking or a new unit/division	: The proposal relates to the establishment of a new export oriented undertaking.
5. Location of the new undertaking	: Saidapet, Chingleput District, Tamil Nadu
6. Capital structure of the proposed undertaking	: Equity Capital — Rs. 41.50 crores.
7. In case the proposal relates to the production, storage, supply, distribution, marketing or control of any goods/articles, indicate	:
(i) Names of goods/articles	: Low Density polyethylene
(ii) Proposed licensed capacity	: 1,20,000 MT/year
(iii) Estimated annual turnover	: Rs. 176.20 crores.
8. In case the proposal relates to the provision of any service, state the volume of activity in terms of usual measures such as value, income, turnover, etc.	: Not applicable
9. Cost of the project	: Rs. 166 crores.
10. Scheme of finance, indicating the amounts to be raised from each source	: Rs. 41.50 crores through equity and the balance through borrowings from various sources.

Any person interested in the matter may make a representation in quadruplicate to the Secretary, Department of Company Affairs, Government of India, Shastri Bhavan, New Delhi, within 14 days from the date of publication of the notice intimating his views on the proposal and indicating the nature of his interest therein.

Dated this 14th day of September, 1989.

For ASIAN CABLES LIMITED,
K. PRAKASH
Secretary.

industries increased to 28.2 and 18.4 per cent respectively. A sharp decline in the share of cotton textile is registered from 23.7 per cent to 8.8 per cent in 1985-86. Engineering and chemicals, the two industry groups with net outflow to the tune of Rs 630.2 crore and Rs 487.3 crore are the major contributors to the overall deficit.

Among the constituents of foreign exchange earnings and expenditure, it is observed that exports accounted for 96 per cent of total earning in 1975-76. The share declined to 83 per cent towards end. On the expenditure side imports of raw material is the largest component although its importance declined from 66 per cent to 60 per cent. A slight increase in imports of capital goods from 9.8 per cent to 11.1 per cent and sharp rise under category of 'others' from 7.06 per cent to 13.48 per cent is registered. This coupled with slower growth in exports resulted in net outgo of foreign exchange. The steepest rise under foreign exchange payment is observed to have occurred under the head 'others'. Over the decade it registered a ten-fold increase. In view of large magnitude and its growing share, a detailed break-up is necessary to know its precise character.

Large public limited companies show similar trend in respect to foreign exchange earning as that of medium and large companies. Data are available up to 1987-88 where in the last year imports shot up sharply, giving a deficit of Rs 882 crore as against deficit of Rs 1194 crore in 1986-87 (Table 13).

The corporate sector underwent sharp structural changes over the period. The pattern shifted in favour of import intensive industries like engineering and chemicals as against cotton textiles. This can be said to be the main factor responsible for increase in imports. Interestingly these are also major export earning industries. Towards the end of the period most of the industries including cotton textiles recorded net outgo on foreign exchange account. The share of external transactions in total production started increasing. As such the process of liberalisation can be said to have set in. This feature is not confined only to large companies but also is the case with medium and large public limited companies in general.

Imports seem to comprise mainly of raw materials as against export which comprise of finished goods. Imports of capital goods constitute a small share. Payment of other items of foreign exchange outgo show sharp rise in absolute value. But except 'others', the rest of the items do not show relative increase. The earlier period also witnessed fall in the share of these items. In fact, this was taken as one of the effect of liberalisation by K K Subrahmanian.

Private limited companies show different pattern. This sector is a net earner through the entire period. In 1985-86 the surplus amounted to Rs 206.5 crore (Table 14).

Summary and Conclusions

To recapitulate, we have compiled data relating to the foreign exchange expenditure and earnings of private corporate sector in India for the period 1960-61 to 1987-88. It is collected from RBI studies/surveys, namely (1) RBI Survey Reports on Foreign Collaboration, (2) RBI Studies on Medium and Large Public Limited Companies, Large Public Limited Companies and Private Limited Companies and Foreign Controlled Rupee Companies which are published periodically. Each set is different from the other in respect of coverage, definitions, etc. This is the main limitation apart from several others in making an assessment of the pattern over the period that the reader should keep in mind. Nevertheless, it helps in grasping the underlying trend and issues in this area. On the basis of the information we collected, the period 1960-61 to 1987-88 can be seen to have passed through three phases. (1) 1960-61 to 1972-73: It was marked by a *net outflow* of foreign exchange. A sharp decline in the share of imports and marginal decline in exports to production is observed. In that sense it is inward-looking. (2) 1974-75 to 1977-78: *Net inflow* of foreign exchange is recorded. This was attributed to recession in Indian economy causing fall in demand, which was the sum effect of various developments—enactment of FERA in 1973, oil price hike, delinking of rupee with sterling and linking it to the basket of currencies, increase in remittances, etc. It also coincided

with plan holiday. The policy changes were not significant. The ratio of imports and exports to production declined. (3) 1978-79 to 1987-88: *Increasing net outgo of foreign exchange.* India had comfortable balance of payments position at the beginning of the period. It encouraged imports and this trend continued. Foreign investment has been viewed by the government of India as a vehicle for transfer of technology not indigenously available to promote export oriented production. From time to time having regard to diversification of the industrial base in the country, the development of indigenous technology and the changing areas requiring foreign investment and technology, the government of India revised the policy relating to foreign collaboration. It is in this light the trend in the net foreign exchange earning of the private corporate sector should be viewed.

For 1987-88 for large companies, there has been fall in the net outgo of foreign exchange earnings. This raises the question whether this would mark turning in the sense reversal of trend of net outgo. In other words does Indian manufacturing sector have the potential of emerging as net foreign exchange earner.

Another interesting feature is the sectors, namely, engineering and chemicals which are showing high earning as also incurring high expenditure. So the feature 'imports for exports' needs to be looked into carefully as a strategy of growth.

Further imports consist of large proportion of *raw materials* and 'others'. This category 'others' which is supposed to include export promotional expenses inclusive of expenses of executives' trips abroad is showing sharp increase. It is found that such expenditure under others constituted less than 5 to 6 per cent of the exports in the mid-seventies. But in the recent period, the ratio has risen to 26 per cent.

In an evaluation report[8] on the export performance of 405 large companies, the corporate studies of the Indian Institute of Public Administration has come out with interesting findings. There has been a decline in the number of export earning companies. The number of companies reporting imports ranged from 397 to 387 as against 271 export earning companies. The exports are generally directed to the Soviet Union, East European and African countries and not to the countries where Indian companies are sure to face competition. Further, these companies have sub-contract arrangements with other producers and such traded items account for a fairly large share of their exports.

ICICI and IDBI studies confirm the trend of increasing outgo of net foreign exchange. The RBI study of public limited companies more exhaustive in coverage, is perhaps a better indicator of the performance of the private corporate sector. The information base provided in this exercise thus is expected to be useful to the policy makers, industrialists and researchers. It will be interesting to view these trends against the observations made by Kidron in 1965.

Foreign investments contribute to the weakness of Indian planning in a number of ways, two of which are important. No matter how large the Indian operations of foreign firms—sometimes very large and very important indeed by Indian standard—these seldom form more than a small proportion of their global activities. On the other hand, no matter how small a firm's operations in the country, they are part of a single fabric made up of the activities of government and international agencies as well as private lending, investing and trading organisation. While each firm might therefore find it relatively easy to withdraw when faced with what it considers an acceptable demand on the part of government—India would have to pay a very heavy price for misjudging the threshold of acceptance common to the foreign sector as a whole. It is within this broad immunity that the price and profit adjustments, the erratic investments flows, the restraints on the diffusion of know-how and methods of control flourish.

Even more significant is the way in which foreign investments strengthen the private sector. Much of the dynamism of private industry can be traced back to the increasing number of collaboration agreements concluded since 1957. These have provided know-how, finance, foreign exchange and moral support; they have been used to beat back taxation forays and to annex state projects for the private sector; they have drawn the teeth of the government threat to introduce foreign firm to treat Indian monopolies. In a way they have provided Indian industries with a toe-hold of extra territoriality from which to confound the planner in every aspect of their work. The distortions go deep—to permit private industry to break the bottlenecks becomes irresistible and with it volume of foreign exchange collaboration grows. The growing dependence on foreign resources and, even more, the growing resignation to such dependence have affected the whole tenor of the government's approach to foreign private capital. If in the first decade of independence the official attitude was governed by considerations of control and economic powr, it has since been progressively determined by narrow balance of payment considerations with rather self-defeating consequences in further concesions to the private sector, to foreign investors, further dependence on aid, further delays in public sector projects and so on.[9]

The data documented in this study raises the question has the relatively small export component of major Indian industries led to a situation where liberalisation means only India opening out to the world rather than India being able to take advantage of the world economic situation?

'Big Dam' Debate

Among both the opponents and the supporters of 'big dams' there is a wide range of persons: the scholarly and thoughtful, the well meaning but ill-informed, the highly partisan, the populist and the charlatans. Unfortunately even at the most distinguished level on either side there seems to be a failure to see the force of the opponents' point of view. Moreover the general polarisation of attitudes on the environmental aspects prevents an adequate discussion of other important issues. A-107

Oraon Labour Agitation

Starting in November 1915, the agitation of tea plantation labour of Duars in Jalpaiguri district in North Bengal spread rapidly to a large number of gardens stretching over the extensive Duars plantation tract and continued till mid-1916. Although the agitation was short-lived, a discussion of its various aspects helps to enrich our understanding of tribal as well as plantation labour protest movements. 2197

Failure of IRDP

Discussion of the effectiveness of the Integrated Rural Development Programme need to separate two questions. First, how to determine whether and to what degree IRDP has been successful in a particular context. Second, to what extent are the shortcomings in the performance of the programme intrinsic to the conception of the IRDP? 2203

Tea Co-operatives

The co-operative tea factories in Nilgiris have ensured fair prices not only to their members but also to growers in areas where there are no co-operatives. While providing subsidies to the large estates, the Tea Board operates through associations of the planters. Why can it not operate through the co-operatives while catering to the small growers? A-145

Farm Incentives

In Indian agriculture government tinkers with the market mechanism through its price support/procurement policies on the one hand and its subsidisation of major agricultural inputs on the other. An attempt to estimate the prevailing effective incentives for cultivators of different crops in different regions. A-124

The main constraint in increasing oilseeds production in the country is technology and the dangers of a strategy of laying sole emphasis on the price mechanism need to be guarded against. A-133

DA Judgment

The judgment of the Bombay High Court on the subject of ceiling on dearness allowance has to a small extent helped to lift the flagging morale of trade unions in Bombay. All the same the judgment is both anachronistic and ironic. 2181

Irrigation: Big vs Small

Investment norms for minor irrigation derived from plan statistics on outlay and irrigation potential are underestimates and comparisons with the corresponding norms for major and medium irrigation works give a misleading picture that minor irrigation is less capital using. A-117

Irrigation and Agrarian Capitalism

Study of agrarian change in Kesala in Valsad district of south Gujarat over the past two decades clearly indicates the strong trend towards capitalist farming. The trend is, however, largely limited to the bigger landholders, especially the Patidars and Anavils. The construction of a large-scale canal irrigation system in south Gujarat has offered these farmers the means to transform themselves from commercial farmers into full-fledged rural capitalist entrepreneurs. A-94

Centre's Game

Evidence available from different sources shows the extent to which institutions charged with maintaining peace and order have been deliberately suborned by the central government in Assam to further its machinations against the non-Congress(I) government. 2180

Revolution Reconsidered?

Present Soviet thinking about progress towards socialism in the third world marks a reversal of what was being said in the past concerning imperialism and revolution. The need to reassess the earlier thinking has arisen, according to the current official Soviet view, because of a re-evaluation of the trends in the third world and the growth of productive forces in countries which were till recently considered lackeys of imperialism. 2209

LETTERS TO EDITOR

An Indian 'Big Brother' Pontificates

ANYONE who has watched at all carefully recent events in Sri Lanka must be dismayed by the factual inaccuracies and conceptual flaws in AM's 'Calcutta Diary' of August 5. AM's piece is yet another example of the freedom that some "Indian big brothers" have arrogated to themselves to pontificate about Sri Lankan matters. As evidence consider the following items:

(1) AM asserts that the IPKF was sent to Sri Lanka "not to discipline the LTTE who are devoid of any class ideology, but to save the [Sri Lankan] oligarchs from the revolutionary insurgency unleashed in the island's south". The fact is that the LTTE has been hellbent on dominating the north and east of Sri Lanka by murdering Sinhalese, Tamils, Muslims, Indians and even erstwhile colleagues, who have obstructed their power-drive. As for the "revolutionary insurgency" in the south, it broke out only as a reaction to the Indo-Sri Lanka Accord, through which a thoroughly discredited president of Sri Lanka, at the nadir of his unpopularity, was compelled by events to give a measure of regional autonomy to the Tamils of Sri Lanka. In the immediate post-Accord period "the revolutionary insurgency" was actively promoted or tacitly encouraged by many famous non-revolutionaries like Sirimavo Bandaranaike and Premadasa himself, a proud opponent of the Accord.

At any rate, contrary to AM's assertion, since their arrival in Sri Lanka, the IPKF has been wholly engaged in the business of disciplining the LTTE, losing well over a thousand soldiers in the process.

(2) AM indulges the supposition that because it is too late to save the "nobility" in Sri Lanka, prime minister Gandhi has now set his sights on extending his empire by annexing the island's north-eastern beach heads. Evidently AM regards Sri Lanka's rulers as a "nobility". The fact is that Sri Lanka has no known nobility. Perhaps here AM is being jocose. And far from extending his empire, Rajiv Gandhi is now busily retreating from Sri Lanka, without having even properly disciplined the Tigers.

(3) In AM's judgment, post-independence Sri Lanka has been ruled by an *enlightened* oligarchy (AM's italics). The fact is that the politics of this oligarchy has reduced Sri Lanka to barbarism in some 40 years. So AM's characterisation of them as being "enlightened" must be only a (sick) joke.

(4) As if endorsing the JVP's indiscriminate firepower, AM records that "upstart Vijaya Kumaranatunga (*sic*) was gunned down last year". AM could not perhaps be expected to know the courageous, humane, non-racist, egalitarian posture that Vijaya Kumaratunga adopted during that period when vicious anti-Indian hysteria was being whipped up, especially by the JVP. The fact is that an estimated three million of Sri Lanka's 16 million people filed past his dead body and honoured him with a spectacular funeral.

(5) With ill-concealed contempt AM says that "plebian Premadasa" thinks that he could "save the system which has been kind to him" if only the IPKF would now withdraw. The fact is that the JVP thrives mainly on its crude racism and anti-Indian propaganda. Its 1971 infantile misadventure merely exterminated thousands of immature youth. In each and every parliamentary or presidential election the JVP has hitherto participated in, it couldn't muster enough votes even to save its deposits. President Premadasa therefore probably infers that the JVP's current cloak-and-dagger campaign of terrorist slaughter is nothing like a revolutionary mass movement. Having made the equivalent of a journey from log cabin to White House, he may be presumed to know something about grassroots politics in Sri Lanka.

In any case, in order to verify the JVP's anti-Indian hysteria or mental disorder, all AM has to do is go to the south of Sri Lanka and try to sell, say, the prestigious journal called the *Economic and Political Weekly*. I promise you, by a standing JVP order AM will be summarily executed by "unidentified gunmen" for selling Indian goods.

London FRANK DON NANDASIRI

Health Implications of Nuclear Energy

IT has now become very important that we focus our attention on the problems posed by nuclear technology. Despite the fact that reactor technology is beset with hazardous shortcomings that threaten the health and well-being of the people, nuclear power plants for 'peaceful' purposes are spreading throughout the world, including in India. Because of this proliferation of power plants and also of nuclear weapons the most ominous threat to public health imaginable is becoming more real everyday. Moreover low level radiation technology is increasingly used in medicine and for other purposes such as food disinfection without adequate research on its effects on the human body.

To debate the health implications of these developments Medico Friend Circle (MFC) has planned to organise its next annual meet on this theme. In a preliminary discussion held in the core group of MFC, the following background papers have been planned tentatively: (1) basic concepts of radiation hazard; (2) safe levels of Radiation-ICRP: how are these decided? Issues of minor and major health hazards; (3) (a) health implications of the nuclear fuel cycle; (b) health hazards of over-ground explosion or leaks in reactors; (4) summary of previous nuclear hazard controversies; (5) the Indian scenario—nuclear plants, problems and safety record; (6) comparative study of health implications in (a) hydro-electric projects, and (b) thermal plants; and (7) implications of low level radiation on radiologists and patients through x-ray.

Other background papers on related topics are welcome as are articles on the theme of the conference for publication in the MFC bulletin. Papers should reach us before November 15. Those interested in participating in the conference may write to the convenor regarding venue and other details. As usual participants will pay for their own lodging and boarding during the meet besides a nominal registration fee to cover the cost of the background papers.

The Price Crunch

THE government, which had been patting itself on the back on the performance of the economy, has at last been forced to admit that things are coming unstuck on the price front. The signs are clear even from the official index of wholesale prices. Between the end of March and the beginning of September, that is, in the first five months of the current financial year, the price rise as measured by the wholesale price index was 6 per cent compared to 3.6 per cent in the same period of last year. It is hardly necessary to add that the figure of the rise in the overall price index gives little idea of the actual impact of the increase in prices. In fact the most ominous aspect of the price situation, in not just the last five months but over a longer period of, say, the last year and a half, has been the very sharp increases in the prices of a number of essential items of consumption which cannot but have significantly reduced the real incomes and consumption standards of the large majority of the people. Among these are foodgrains, especially pulses, and a wide range of other primary food articles as well as manufactured food products such as sugar and gur, edible oils and even common salt. The most piquant aspect of the sharp rise in prices of these everyday consumption articles is that it has come in the course of and just after a year in which the government has claimed a growth of as much as 10 per cent in real GDP and 23 per cent in agricultural production. The government likes to put forth estimates of the proportion of the population supposedly raised above the poverty line from one year to another; no corresponding calculations are, however, likely to be made of the number of those pushed below the poverty line as a result of the government's failure to prevent the steep increases that have taken place in recent months in the prices of basic necessities of life.

Given the proximity of the elections and the manner in which the price of, for example, sugar has shot up in a matter of a few weeks, the suspicion is widespread that political fund-raising for the elections has had not a little to do with the recent behaviour of prices. Well-founded as such suspicion undoubtedly is, it must be said that the roots of the price rise have to be traced to the government's economic policies. By implication, the current spell of rising prices is likely to outlive the exigencies of the elections. The most material factor in this connection is, of course, the massive amounts of liquidity pumped into the economy year after year. What is relevant here is not only the large increases in aggregate money supply fuelled by the government's huge fiscal deficits, but, even more importantly, the virtually unlimited access to funds which organised industry and trade have gained in recent times. The Reserve Bank's annual report discloses how incremental bank credit to the commercial sector galloped from Rs 12,389 crore in 1987-88 to Rs 20,531 crore in 1988-89 (by comparison, much-maligned net bank credit to government in 1988-89 was only Rs 12,715 crore). And bank credit is only a part of the story. Assistance sanctioned by the all-India financial institutions in 1988-89 was 57 per cent larger—Rs 13,913 crore compared to Rs 8,868 crore in the previous year. And the Controller of Capital Issues for his part had been pleased to grant consents for capital issues by non-government public limited companies to the tune of Rs 8,029 crore, yet another instance of a more than 50 per cent increase over the preceding year. Clearly, the government and the monetary authorities have decided that it is quite unnecessary for them to concern themselves with the funds-grabbing operations of industry and trade and with what the funds are used for. This, it can be claimed, is quite consistent with the government's market-oriented economic policies. Once the business house in question is willing to pay the going price for the funds and has persuaded, no matter how, the commercial banks or the financial institutions or the capital market, as the case may be, of its 'credit-worthiness', it is not for the government to reason why.

The election, it is true, presents a temporary difficulty. It is unbecoming to have prices rise inordinately just now. So it has been decided to arrange emergency imports of the critical items in short supply. True again, the level of the country's foreign exchange reserves—now down to the equivalent of a bare six weeks' imports—does not afford much leeway in regard to additional imports. But that particular difficulty can perhaps be taken care of by raising some quick commercial loans abroad, using the financial institutions and the public sector oil companies as borrowers, no matter what the price that has to be paid in terms of future debt servicing obligations. But after the elections what? Clearly, dousing inflationary pressures through additional imports is unsustainable except in the shortest of short runs, unless other imports flooding the economy can be curbed. But these imports are now, under the industrial and import liberalisation regime, the very heart of industrial growth and business profits. These can scarcely be sacrificed. In short, the mouth-watering claims about growth rates notwithstanding, some of the intractable conflicts and contradictions inherent in the chosen path of the economy are coming to the fore.

HEALTH

Medicalising Malnutrition

MALNUTRITION, especially in third world countries, has been the subject of much discussion and research among nutritionists for decades now. True to type, much of this activity has resulted in the 'discovery' of medical reasons for what is essentially a social and political problem. Not surprisingly then this has resulted in technical interventions in public health which offer at best limited solutions while masking the real problem. The identification of protein-calorie malnutrition led to large-scale feeding programmes, none of which has been entirely successful. Many of these programmes had to reckon with problems such as the uneven distribution of food in the family, patriarchal biases, etc, all of which are aggravated in a situation of poverty.

Another such widely acknowledged discovery has been the link between malnutrition and diarrhoea. For some years now health programmes have tended to focus on diarrhoea as the major factor in determining nutrition status. In consequence, interventions which achieve a substantial reduction in morbidity due to diarrhoea have been promoted in the hope that they would improve the nutrition status of the children. Not surprisingly, all other factors which lead to childhood malnutrition have been mostly ignored by health workers as being beyond their scope.

Now comes a study reported in *The Lancet* of August 5 which challenges this assumption that diarrhoeas are the main cause of malnutrition. The study in a rural area of Bangladesh among children aged from 8 months to 35 months shows that the effect of diarrhoea is only transient. Episodes of diarrhoea which occurred at the beginning of the three-month interval which was monitored, it was seen, had no effect on the weight gain over the interval. Weight gain suffered only immediately following diarrhoea but not in the long run. Similarly, while diarrhoea delayed linear growth, this effect was only transient, other than in the case of dysentery. The study concludes that diarrhoea "produces short depressions on the growth curve without greatly affecting its general shape". In other words, while interventions directed at preventing diarrhoea are important in themselves, they do not contribute greatly towards improving the nutritional status of the child population. Moreover, other studies which the authors quote show that food intake in children suffering from diarrhoea did not show a significant reduction.

The conclusion is inescapable—in poor populations childhood malnutrition is not because of diarrhoea but because of poor total intake of food. The solution therefore lies in introducing social measures rather than in promoting 'health' interventions. The Bangladesh study underlines yet again the limited scope and impact of health work in the absence of a socio-political movement in the community. ORT or even improved water supply and sanitation, while they are important in themselves, are no substitute for adequate food.

INDIA-PAKISTAN RELATIONS

A Command Performance?

PAKISTAN's senate has recently come out with a call for the immediate withdrawal of the Indian armed forces from the Siachen glacier and a renewed demand for a plebiscite in Kashmir. The upper house of Pakistan's parliament, still dominated as it is by late military dictator Zia-ul-Haq's handpicked conservatives in contrast to the lower house, the national assembly wherein Zia's opponents have a majority, is thus transparently engaged in queering the pitch for prime minister Benazir Bhutto—specifically, for her efforts to solve the vexed question of the possession of the supposedly strategic 74-km long and two-to-three km wide glacier at the top of the world.

It will however be a biased view to think that this spiking game is being played by one side only; it was indeed started by the Indian side, although with a greater refinement. Following the press reports about a possible meeting between the prime ministers of the two countries for an amicable settlement of the Siachen dispute, a horde of Indian journalists were airlifted to the troubled glacier towards the end of August to be received by the GOC, Siachen area, Maj-Gen V R Raghavan, for extensive briefing. After expressing his refusal to be "drawn into a conversation on reported proposals about demilitarising the zone", the general however made his position crystal clear. "The general," to quote from a newspaper report, "in fact, said it was a misnomer to call it a fight for the Siachen glacier as it was firmly and *legitimately* in Indian hands. . . there was no *compelling reason* for the Indian side to withdraw" (emphasis added).

Legitimacy and compelling reason are certainly not matters that legitimately fall within the competence of a serving general; they are subjects for political decision in the light of much wider considerations. Coming out with his personal views on these questions the general was certainly transgressing his pertinent limits. "We are holding dominating heights," said the general, according to another newspaper, and this "assessment is what the army would like to be borne in mind at the negotiating table".

The army has certainly the right to press its views on the political leadership of the country, but not through a country-wide newspaper campaign, particularly on the sensitive issue of India-Pakistan relations in a period of intense and growing communal tensions.

Strangely enough, while many eminent political commentators have noticed "a very disconcerting element" in "the emergence of the Brass Hats in the political arena" in the specific instance of retired general and former chief of army staff Sundarji's press interview, the serving general's intervention seems to have passed generally unnoticed. Or, perhaps, it was no transgression but a command performance authorised by someone in the government?

FISCAL DEFICIT

Narrow View

EARLY this month, R J Chelliah, member of the Planning Commission as well as of the Finance Commission, in an address to the Indian Merchants Chamber in Bombay spoke of containing "the fiscal deficit in terms of total net borrowing of the government sector as well as budgetary deficit in the sense of RBI credit to the government" in order to maintain "non-inflationary conditions". He suggested for this purpose the introduction of "a convention that every year around this time of the year the finance minister and the governor of the Reserve Bank should together come to an agreement about a tentative figure of budget deficit that could be safely financed by the RBI in the budget for the next financial year".

Within a week or so of Chelliah's statement came the annual report of the Reserve Bank which too emphasised the "importance of price stability as an objective of economic and monetary policy" and called for "a reasonable degree of control over the creation of reserve money". In this context, the report brings out that "over the years, the practice has grown under which the entire budget deficit of the central government has been financed by the Reserve Bank leading to an automatic monetisation of the deficit". This, the report points out, "is in addition to whatever support the bank may provide to the market borrowing programme of the government". As a consequence, the bank has "to address itself continually to the task of neutralising to

the extent possible the expansionary impact of deficits". The report, therefore, suggests that as a step to avoid "the automatic monetisation of the budget deficits" the government "should beyond a mutually agreed ways and means accommodation from the Reserve Bank, place its entire debt in the market at appropriate interest rates".

This convergence in views from Delhi and Bombay on putting the whole burden of whatever adjustment is called for on fiscal restraint in order to keep the price situation under control is certainly very interesting. What is altogether ignored is, of course, that even in conditions of fiscal balance inflation can raise its ugly head. But the more basic questions that should be asked are about the sort of economic growth the country ought to be pursuing and the sort of fiscal policy that needs to be followed to support such growth. Instead what is being advocated is a monetary policy designed purely to subserve market forces.

STEEL

Missed Opportunities

THERE has been some recent speculation in the financial press about a government proposal to merge Metallurgical and Engineering Consultants (India) (MECON) with the Steel Authority of India (SAIL). The reasons for the proposed merger are not at all clear but one should nevertheless weigh some possible implications of such a move.

MECON had its origins in the Central Engineering and Design Bureau (CEDB) of the erstwhile Hindustan Steel at the Rourkela steel project in 1959. The CEDB prepared the project reports for the first expansions of Durgapur and Rourkela steel plants in the early sixties. This was creditable since the only experience that CEDB engineers had was a brief association with West German steel plant designers of IGKD, the Krupp-Demag combine that collaborated in the setting up of RSP. The Soviet collaborators at Bhilai steel plant aided the formation of a Design Cell which was later on merged into the CEDB. The Soviets however insisted on preparing the project report for the first expansion of Bhilai themselves and agreed only to the association of Indian engineers in its preparation as understudies. The first major opportunity that came for Indian steel plant design engineers was lost, when in the sixties, M N Dastur and Company were replaced by the Soviet design organisation Gipromez in the Bokaro steel project due to a combination of inept handling of negotiations by the Indian government and the obligations of 'tied' credits. Thereafter, the Soviets made major inroads into the steel sector by collaborating with CEDB. CEDB and later MECON was made the principal engineering consultant for the first expansion of Bokaro and second expansion of Bhilai, but, by virtue of its collaboration with Gipromez, it virtually advanced Soviet economic interests. In 1969, the CEDB entered into collaboration with United Engineering (US) (now, Wean United) in order to acquire the capability to design rolling mill equipment. But virtually no major contract came its way until the expiry of the agreement ten years later when MECON was given the orders for mechanical equipment for the cold rolling mill complex at Bokaro. A DGTD technology absorption/assimilation study of 1979, while recommending extension of the collaboration, said that MECON had not assimilated the technology.

MECON has entered into quite a few other technical collaborations for design of steel plant equipment. Among these are the ones with (1) Clecim of France for a system of collection and recovery of off-gases from basic oxygen converters, (2) SMS Schloemann Siemag of West Germany for design of light and medium section mill product rolling mills, (3) Giprokoks of the Soviet Union for 7m tall coke ovens and dry coke quenching systems. MECON does not have any manufacturing facilities of its own and these collaborations have effectively ensured large imports from the collaborators and their associates for the Bhilai, Bokaro and Vizag steel projects.

In such circumstances, the merger of MECON with SAIL would oblige the latter to give contracts to the former in the present modernisations of Durgapur, Rourkela and IISCO plants. This would circumvent competition and, in effect, advance the economic interests of MECON's foreign collaborators. The SAIL chairman, V Krishnamurthy, is well aware of this eventuality and is said to be opposed to a merger. The SAIL has, in recent years, built up a Centre for Engineering and Technology which serves as a kind of in-house engineering consultant.

Both MECON and Dasturco, who started out as steel plant engineering consultants, have diversified, for they had to find means to utilise their engineering human power and ensure a reasonable growth. With the bunching of large investments in the modernisations of the integrated steel plants and in the proposed setting up of a few semi-integrated steel plants (direct reduction + electric furnace units) like that of the Essar group or that of Usha Rectifier, design and engineering contracts should have come their way. But, for instance, in the new climate of deregulation, it is Canadian Metchem (a subsidiary of USX, formerly US s[illegible]) and not MECON that is handling the engineering services for the Essar project. What role MECON is playing may entirely be that of a junior partner.

In this age of monopoly capital it is transnational combines and conglomerates that rule the markets. Combines or conglomerates like Voest-Alpine, Mannesmann Demag, Sumitomo Kawasaki, etc, offer the complete range or gamut of activities from design of steel plants to manufacture of steel plant equipment to production of steel. Most technological developments in the steel industry have in fact been the result of co-operation between design organisations, plant manufacturers and steel producers. The merger of MECON with SAIL can have the potential for closer co-operation between design and engineering and steel production. But one may argue from past experience that even when MECON was a subsidiary of the holding company, SAIL, between 1973 and 1978 or when the CEDB was within the fold of Hindustan Steel (from 1959 to early seventies), it did not contribute much to local technological innovation and development in steel. If so, then why? It is such issues, which do not engage the attention of the government, that need to be examined in detail. But unfortunately it is only issues like commercial viability and personal gain that occupy the attention of the government.

NRI DEPOSITS

Why This Coyness?

ALL official agencies, including the Reserve Bank, continue to refuse to treat NRI deposits as part of the country's foreign debt. The fact remains, however, that these deposits have grown very large indeed. At the end of the fiscal year 1988-89 they amounted to a little over Rs 14,000 crore. This was equal to a fifth of the country's total external debt which the Reserve Bank's annual report puts at Rs 70,000 crore. What is more, for some unexplained reason, the figure of NRI deposit liabilities does not include accrued interest on deposits denominated in foreign currencies (the FCNRA deposits) which could easily come to another Rs 1,000 crore. Add to these amounts the figure of short-term debt and the country's total debt straightaway crosses the rupees hundred thousand crore mark.

So when the Reserve Bank's annual report takes the view that different sets of data on external debt are not difficult to reconcile, it forgets to explain why official sources still tend to opt for figures which are on the lower side. What is the harm

in presenting the total picture?

Set against the size of the external debt, foreign exchange reserves in rupees are now a mere six thousand crore. In terms of SDRs, the reserves fell by 17-18 per cent in 1988-89 and by another 8 per cent in the first quarter of 1989-90, so that by June this year they had reached a level of SDR 3,408 million which would not cover more than six weeks' imports.

The Reserve Bank's annual report, unlike the government of India's Economic Survey, publishes figures of the annual accretions to NRI deposits under the Non-Resident (External) Rupee Account and Foreign Currency (Non-Resident) Account schemes. This information on the annual inflows is particularly useful because the Economic Survey's figures of outstanding liabilities under the NRERA scheme are inclusive of accrued interest with the result that one does not quite know what the net accretion of foreign exchange on this account is from year to year.

But strange are the ways of government agencies. One gives out a piece of information, another sits tight on it. And neither will give out another but connected bit of information with the result that outsiders are left to make their own estimates. In this particular case, by piecing together the information on NRI deposits put out by the Reserve Bank and the government, it is possible to derive the interest accruals on NRERA deposits fairly easily but not those on FCNRA deposits. Only some rough estimates can be attempted.

It is possible that figures in regard to interest accruals can be made available only with some time-lag. Let that be so, but let the information be made public as and when it is available so that people do not have to make guesses and draw unwarranted inferences. Surely, no security interests would suffer if figures of interest accruals on FCNRA deposits were given out or on NRERA deposits information were provided on yearly withdrawals, broken down into at least two categories, namely, withdrawals in rupees and those reconverted into foreign exchange.

BURMA

India's Special Advantages

A Correspondent writes:

THAT the authorities in Burma should accuse India, along with Britain and the United States, of using its embassy in Rangoon to send news about recent developments in that country to the news services of All India Radio is not in the least surprising. India, along with Britain and the United States, maintains a large staff in its embassy and closely monitors developments in that country. Indeed the India mission is generally conceded by other foreign missions in Rangoon to be about the best informed on developments in Burma.

Further, all these countries which have been apparently attacked by Brigadier General Khin Nyunt, head of Burma's military intelligence (a formidable and highly efficient set-up despite the carefully cultivated image of its being manned by a set of boobies who bumble along making the very term 'military intelligence' a contradiction in terms) maintain their embassies in the downtown area unlike most others who are dispersed in the suburbs and are thus able to monitor developments first hand. The advantages of this location were most evident during the demonstrations and riots last year when one could watch the drama below from the windows of these embassies.

India also has some special advantages that other countries, including other neighbouring countries, lack. Being the inheritor of the empire that once ruled both India and Burma India has access to a mass of still exclusive information. Indeed, while Burma shares its borders with China, Laos, Thailand and Bangladesh, along with India, the whole country was itself once part of India—a special relationship that other bordering countries cannot claim. These historic links have been sustained through much animosity and mututal suspicions in the post-U Nu period.

Secondly, some of the tribal nationalities in India's north-east have close cultural and familial links with their cousins across the border in Burma. The Indian official representation in Burma is marked by a considerable presence of these tribal nationalities—a fact which has always been resented by the authorities in Rangoon but about which they have been able to do little.

Indeed, India's access to information not generally available to other foreign missions in Rangoon has been enviously acknowledged by these other missions themselves. So for that matter is the credibility of All India Radio's external service beamed to Burma—something that may be incomprehensible to people in India who do not associate credibility with the All India Radio's domestic services.

The authorities in Burma have themselves acknowledged this as was evident when the officially controlled *Working Peoples Daily* of Rangoon launched what has been described as "several vitriolic attacks" on All India Radio early this year on its coverage of the internal developments in Burma. That the Burmese service of All India Radio is headed by a person prominent in Burma's political and cultural life now in voluntary exile in India has also contributed to this credibility. Indeed a correspondent of the *Far Eastern Economic Review* (February 23) had noted that "today AIR has overtaken the BBC's Burmese service in popularity among the public at large".

BUSINESS

STOCK MARKET

Cornering Funds

SEVEN weeks have gone by and the stock market has not pierced through its August 8 low touched during the sharp decline from its June-end/early July all-time high. This is not to suggest that the market will not seek lower levels and that if it does it would signal the reversal of the primary upward trend. A decline below the August 8 mark will only indicate that the corrective phase has still not run its full course. Secondary reactions in a bull market are hard to guess and even the indications are sometimes deceptive. The reaction in a bull market resembles only in direction and not in kind the true primary bear movement.

These general observations seem pertinent as the market's overall behaviour does not provide any convincing clue about its next big move. As it is, bears and bulls can easily marshal seemingly plausible arguments to support their diametrically opposite views and both could also prove right, depending on whether they are taking a very short-term or long-term view of the market. For factors governing short-term price trends could be bearish even when the fundamentals are favourable.

To come back to the market's recent performance, it is worth noting that while the market has not repeated its August low so far, it has also not been able to make any significant upthrust which could carry it even beyond the half-way mark between the year's high and subsequent low point. The rally which commenced after August 8 did not last beyond September 7. During the rally, the *Financial Express* equity price index for Bombay rose by 5.2 per cent and the all-India index by 6.3 per cent, retracing 44.9 per cent and 50.7 per cent respectively of the ground lost in the preceding fall from the all-time highs. During the same period, the BSE sensitive index rose by 3.8 per cent and the national index by 6.3 per cent, retracing 29.5 per

ground lost in the preceding decline. All this suggests that the weakness has been more pronounced in the (speculative) 'specified' scrips than in cash shares.

Apparently, bears have been fully exploiting the adverse turn in market sentiment in the wake of persistent offerings by investors to conserve and augment their cash resources to avail of the opportunity for more profitable deployment of funds in the primary market where several convertible debentures are on offer by way of rights. Trading sentiment was also adversely affected by reports of a marked deceleration in industrial growth during the first two months of 1989-90, the average index for industrial production registering a rise of only 2.7 per cent over the corresponding average for the last year. The comparable increases during 1988-89 and 1987-88 were 12.5 per cent and 10.5 per cent respectively. What is more disturbing, the slow down has been brought about by the set-back in the crucial manufacturing sector, with a weight of 77 per cent in the index of industrial production. The latest RBI annual report also has made pointed reference to certain areas of concern, namely, budgetary deficit, growth of liquidity, inflationary pressures and decline in foreign exchange reserves.

If the market has not allowed itself to be unduly perturbed by these reports it is because the corporate news has continued to be very reassuring and the overall growth rate in the economy has been satisfactory. That the market could withstand the bear onslaught and absorb the continuing pressure of disinvestment selling without any landslide in equity prices is attributable in no small measure to the support extended by institutional investors. But it also indicates the market's inherent strength based on sound fundamentals.

The point is often made that institutional purchases are in the nature of rescue operations carried out at the instance of the finance ministry to check any marked deterioration in the general trading sentiment because of its possible adverse repercussions on the primary capital market which is witnessing, for the first time, the phenomenon of mega issues. Whoever thought until very recently of over Rs 4,000 crore being raised in the capital market in a matter of some weeks?

There is nothing wrong in institutional intervention to sustain the market's morale to facilitate mobilisation of resources from the market. But purchases effected by institutional investors cannot be simply dubbed as being in the nature of rescue operations. Essentially, these purchases represent judicious investment decisions based on assessment of the fundamental factors which have a bearing on the long-term outlook for equities. Unlike professional speculators and the majority of the stock exchange fraternity who are concerned largely with short-term price fluctuations and base their operations on their assessment of the mercurial market sentiment, institutional investors are guided by their assessment of long-term prospects. UTI chief Pherwani is known for his 'bullish' outlook based on a careful assessment of long-term factors relevant from the viewpoint of the equity market.

Most observers seem inclined to the view that the market is marking time and no decisive trend is likely to emerge till the elections are out of the way. Possible but unlikely. Speculative markets seldom stay put for long. The 'wait and watch' attitude when parliamentary elections are approaching is nothing unusual. The political factor assumes special significance in the Indian context because of the 'peculiar links the government is believed to have developed with some of the leading lights in the corporate sector. On the basis of economic ideology there is little to choose between the ruling Congress Party and the opposition excluding the Communist parties. What is really relevant from the viewpoint of the stock market is what kind of a majority the party which wins the elections will have.

While the stock market is currently passing through an unexciting phase, the stock exchange fraternity is engaged in an animated debate on the ethical, political and financial implications of the mega issue phenomenon. All kinds of opinions are being voiced. The most charitable view is that the mega issues reflect the growing confidence of the corporate sector and of investors in the capital market. The sudden emergence of the mega issue phenomenon has, however, raised many ticklish issues. The writ petition in the Bombay High Court challenging the takeover of Larsen and Toubro by the Ambani group and the Rs 820 crore mega issue imparted a new and rather explosive dimension to the debate on the mega issues.

Belatedly realising the possible adverse repercussions of many mega issues coming to the capital market within a short time, the Controller of Capital Issues has asked companies raising funds to phase out calls with a view to reducing the rigours of bunching large capital issues. This should help reduce selling pressure in the secondary market. Far more significant is the finance ministry's reported decision asking financial institutions to set up expert teams to closely monitor utilisation of the capital raised. This step is apparently a part of the plan to discourage companies from garnering large funds at one go and to see that these funds are not diverted elsewhere.

TWENTY YEARS AGO

EPW, September 27, 1969

Why all this excitement over car prices? The answer is simple: the car is the new status symbol of the elite in politics, administration and business. The elite is not terribly disturbed when, as in recent months, pulses and edible oils (which have substantial weightage in the working class cost of living) become more expensive or, almost perennially, domestic substitutes for imports remain far out of alignment with international prices. Yet, come a move for higher car prices and screams ring out loud and clear for government intervention—and, of course, government intervenes promptly. Prices of commercial vehicles, i e, buses, trucks and jeeps, which comprise the principal means of public transportation, were decontrolled quite some time back but those of cars, which are bought and used by a small minority of the total population, remained subject to informal control... About the only positive reaction to the situation in the automobile industry from the ministry of industrial development is the reassertion of the proposal to produce a small car. ... Regulation of car prices or, for that matter, renewed talk of a small car, is no substitute for an urban transportation policy and a comprehensive view of the development of the automobile industry as a whole.

* * *

Tea is a major foreign exchange earner, yet the share of Indian tea in the large traditional export markets has been falling and exports have in fact shown a declining trend since the beginning of 1968. At the same time, the profitability of the tea industry is among the lowest. From this to advocating a lower tax burden and a variety of subsidies for tea is an easy jump. Even the high-power Barooah Committee has succumbed to the temptation... Yet is the case so simple? Profitability in tea may be among the lowest, but so are wages. A seventeen-day strike in the north-eastern plantations recently secured for workers a 20 paise per day increase and a higher man-land ratio and that too under the aegis of the United Front in West Bengal. That living conditions of plantation labour in West Bengal have been trying is well known. The element of violence that infests the plantations is not independent of this fact. Nor is plantation management in general famous for its efficiency, the beautifully veiled claims of the United Planters' Association of Southern India (UPASI) to the Barooah Committee notwithstanding.

Notes: (1) Superscript numeral denotes month to which figure relates, e g, superscript[1] indicates that the figure is for January and so on.
(2) Figures in brackets denote percentage variation over previous period.

CROMPTON GREAVES

Vigorous Diversification

CROMPTON GREAVES has fared very well during the 9-month period ended March 1989. The directors have recommended issue of bonus shares in the proportion of one such share for every existing share held by capitalising Rs 9.60 crore out of the general reserve. They have also recommended payment of the same dividend of 18 per cent as was paid last year for 12 months. The company has earned a gross profit of Rs 14.82 crore against Rs 12.99 crore previously following a turnover of Rs 286 crore against Rs 306 crore. These figures show a significant improvement in profit margins. Net profit is Rs 7.75 crore (Rs 5.90 crore). The dividend distribution is covered 4.48 times by earnings as against 3.41 times previously.

The company's R and D laboratories developed and introduced to the market several new products such as Supervisory Control and Data Acquisition and Programmable Logical Controllers. These products have been well received. Some new products/processes have already been patented and several others are almost ready for patent applications. The company's diversification and joint venture plans are progressing on schedule. Three new plants, viz, hydro turbines in Punjab, industrial electronics at Nasik in Maharashtra and instruments and relays at Pithampur in MP were commissioned during the year. Three more projects, viz, telematics at Goa, adhesive tapes for electrical and electronics applications at Goa and television receivers at Pithampur will be commissioned during the current year.

At present the company together with its subsidiary companies holds 10,644 equity shares comprising of 27 per cent of the equity capital of CTR manafacturing industries. It is proposed to purchase an additional 49 per cent of the equity capital of the company which is presently held by financial institutions and with this further investment it will become a subsidiary of the company.

CABLE CORPORATION

Into Extra High Voltage Cables

CABLE CORPORATION OF INDIA (CCI) proposes to diversify into manufacture lightning and surge arrestors which provide protection to electrical equipment in electrical transmission and distribution networks by preventing damage by lightning. The company's technical collaborator, Siemens of West Germany, has the necessary know-how and expertise to manufacture lightning and surge arrestors and h agreed to make available updated tec nology in this respect. Last year the com pany diversified into fluoropolymer cabl which are useful in high temperature a plications. There is a good scope f development of these cables in India, pa ticularly in view of their suitability for us in sophisticated equipment. The compan is also embarking upon a programme t take up the manufacture of extra hig voltage cables which are in great deman in the country and which are presentl being imported. R and D work wit respect to insulants used in these cable is already under way. Meanwhile, th modernisation programme of the compan is progressing well. Various rationalisatio measures adopted have brought forth pro mising results. This, according to chair man D D Khatau, is an ongoing proces and is being systematically monitored.

CCI's performance during the 15-month period ended March 1989 has been encouraging with substantial improvement in profitability. Turnover has amounted to Rs 100 crore against Rs 72 crore in the previous year and gross profit has expanded to Rs 19.17 crore from Rs 10.10 crore. Even after higher necessary provisions, net profit has more than doubled to Rs 10.34 crore (Rs 4.97 crore). Equity dividend has been stepped up from 18 per cent to 27.5 per cent which is covered 4.18 times by earnings as against 3.60 times previously.

Higher cable sales have chiefly contributed to this good performance. There was, however, a decline in the sales of electric motors during 1988-89 as supplies were seriously affected due to a prolonged industrial relations dispute which has since been resolved and normal operating conditions restored. Total foreign exchange used by the company amounted to Rs 1,207 lakh and that earned by it was Rs 21 lakh. The latter figure, however, excludes an amount of Rs 1,221 lakh being the fob value of cables delivered for export through an export house.

UNION CARBIDE

Troubles' End?

UNION CARBIDE INDIA's chairman and managing director, V P Gokhale, hopes that the crisis faced by the company for the last several years will be over by the year-end. The Bhopal-related problems are nearing solution. The Chemicals and Plastics undertaking at Chembur in Bombay has been sold to Oswal Agro Mills. The company has shown a better financial performance during the 15-month period

* 9 months, ** 15 months.

ended March 31, 1989 but not announced any dividend. The current year has started on an encouraging trend of operating profits and Gokhale feels that the management will be successful in protecting the financial viability of the company as well as the interests of shareholders. He says the task before the management is to rebuild the company. This entails strengthening the existing product lines and diversification into growth areas, with simultaneous attention to corporate restructuring.

During 1988-89, despite a good monsoon, battery and flashlight sales remained around the same levels as in 1987, on an annualised basis. Total market demand for batteries has remained stagnant at around 1,200 million pieces per annum for the last few years. For many years UCI has been the major supplier of batteries to the government and defence departments. However, during 1988 it did not receive any orders from these departments and its rate contracts were also not renewed. Only supplies against earlier orders were made during the period. Currently, it is executing supplies of very small volumes. This has resulted in rendering about 300 workmen idle in the battery plant at Cossipore, Calcutta, as well as loss of sales revenue. Sales of electrolytic manganese dioxide were lower as compared with 1987 due to lower offtake by other battery manufacturers. Arc carbon sales were lower than the previous year on an annualised basis, primarily because of the declining trend in the cinema industry and severe competitive pressures. However, demand for cobalt and nickel base hard facing products recorded a healthy increase. Reserve Bank of India's permission for transfer of the processing plant immovable property at Visakhapatnam has been obtained and the sales proceeds of the immovable property have been placed in a fixed deposit account. An application has been made to the Urban Land Ceiling authorities and on receipt of approval the transfer of the property will be completed.

IN THE CAPITAL MARKET

ATV Projects

ATV PROJECTS is making a public issue of 4.27 lakh 14 per cent fully convertible debentures of Rs 150 each for an aggregate amount of Rs 6.40 crore. The company will issue rights debentures for Rs 5.60 crore in the ratio of 5 debentures for each 100 equity shares held and also give on rights basis 1 debenture for 1 existing convertible debenture held for an aggregate value of Rs 9 crore. It has reserved 6 lakh debentures on a firm allotment basis for UTI, LIC, ICICI, GIC and its subsidiaries, bank mutual funds and other financial institutions of the aggregate face value of Rs 9 crore. Rs 30 out of each debenture will be converted into 1 equity share of Rs 10 at a premium of Rs 20 per share at the end of six months from the date of allotment. The balance amount of Rs 120 per debenture will be converted into such number of equity shares as decided by CCI at the end of three years from the date of allotment. The issue is being made to finance ATV Projects' modernisation plans under technical collaboration with IHI, Japan, the second largest engineering and projects construction company in the world. The rights issue opens on September 29 and the public issue on October 4.

Harshavardhan Chemicals and Minerals

HARSHAVARDHAN CHEMICALS AND MINERALS, a leading manufacturer of single superphosphate, is setting up a plant at a total cost of Rs 1,285 lakh for manufacture of sulphuric acid (61,125 tpa), oleum-25 per cent (5,000 tpa) and chlorosulphuric acid (5,000 tpa) at Antervalia-Meghnagar in Jhabua district of Madhya Pradesh. It has also commissioned the first phase of its detergent powder and cake project at a total cost of Rs 284.50 lakh with an initial installed capacity of 33,000 mt each per annum. To finance in part the cost of these two projects the company is issuing 2,59,000 14 per cent secured, fully convertible debentures of Rs 150 each for cash at par totalling Rs 388.50 lakh on rights basis. Each debenture of Rs 150 will be converted into 5 equity shares of Rs 10 each at a premium of Rs 5 per share in two stages. The conversion will take place on the expiry of 12 months and 18 months respectively from the date of allotment. The rights issue, which opened on September 14, will close on October 14. According to Pankaj N Mehta, joint managing director of the company, the installed capacity of its single superphosphate plant has been raised from 40,000 tpa to 66,000 tpa in 1988-89 and further expansion and diversification activities are being carried out at Vatva near Ahmedabad, Udaipur and Antervalia-Meghnagar. The company also plans to generate 1.7 mw of power by utilising waste heat produced in sulphur burning for captive consumption. The turnover for 1989-90 is expected to exceed Rs 30 crore and, when all the plants become fully operational in 1990-91, Rs 200 crore.

Usha Rectifier Corporation

USHA RECTIFIER CORPORATION is coming out with a Rs 702 crore 14 per cent fully convertible debenture issue to finance its Rs 711 crore integrated gas-based sponge iron complex at Amethi in UP. Of the total Rs 702 crore, the company is making a public issue of 1,62,00,000 FCDs of Rs 100 each aggregating Rs 162 crore. Each debenture of Rs 100 will be converted into two equity shares at a premium of Rs 40 per share on expiry of nine months from date of allotment. There will be a rights issue for the fully convertible debentureholders of the company comprising 2,88,00,000 FCDs of Rs 100 each aggregating Rs 288 crore. The conversion terms are the same as in the case of the public issue. To the equity shareholders of the company, FCDs of a face value of Rs 200 each aggregating Rs 252 crore will be offered. The company's plan is to invest over Rs 1,500 crore in setting up an integrated steel complex at Amethi. In the first phase, involving an investment of Rs 711 crore, the company would set up a gas-based sponge iron complex with a capacity of 8,00,000 tpa of hot briquetted iron (HBI). The complex will include a captive 1.2 million tonne iron ore pelletisation plant and a 60 MW gas-based power plant. The plant would use high grade iron ore fines from NMDC's Bailadila mines in Madhya Pradesh as raw material. The second phase of the complex would involve setting up of two 70-tonne electric arc furnaces together with the latest thin slab caster and a 5,00,000 tpa steckle mill to produce hot rolled coils. These facilities including expansion of HBI production would involve an additional investment of Rs 800 crore. The public issue will open on October 11 and close on October 24, 1989 or earlier but not before October 19.

Regency Diaper Industries

REGENCY DIAPER INDUSTRIES is making an issue of 7,80,000 equity shares of Rs 10 each for cash at par. The issue opens on October 16. The Hyderabad-based company is entering the field of disposable diapers for infants. It has tied up with Nuova Red Italiana, international leader in diaper-making machinery, for world class plant and equipment. The civil construction is complete and the imported plant and equipment has arrived at the site. The product will be launched by November 1989. The diapers will be distributed all over India through a special distribution arrangement with J K Helene Curtis. However, the company will do its own distribution in South India. In addition to a large domestic demand there is also a significant export potential, particularly to the Middle East and East European countries.

Calcutta Diary

AM

The mystery is unresolved. Was Simenon himself evil, or was he only interested in evil, in taking it apart, finding out what makes it tick? The other puzzle too remains. Was Simenon a hack writer of pulp who just happened to strike it rich or was he one of the greatest of the literary giants to walk the century now whimperingly coming to an end?

SIMENON is dead. Apart from *Memoires Intimes*, he had in fact produced little in the past decade. The *Memoires* is embarrassing, and not particularly because of the intimacies it reveals. It is Simenon's loss of control over style, his collapse into verbosity, to which the volume bears witness which is more tragic. Obviously, death had already started casting its shadow. Now it is over, there is to be no further Maigrets or non-Maigrets to be added to the two hundred fifty and odd taut works of fiction.

Simenon's passing has hardly bothered either the newspapers or the conventional literary circles. According to one view, he is the most underrated author to straddle the twentieth century. The assertion may be right, but it cannot diminish the other rather straightforward reality: he was not loved. A certain distant awe on the part of his readership, but no feeling of adoration, none at all. The almost supernatural power of his writing was acknowledged, but did not generate any ardour. Not quite a pariah, he was still an outcast. One simply had to read him, for he was habit-forming, but did he not repel too? Camus' L'Etranger started out as the archetypal anti-hero; he is now canonised. Simenon created characters whose existential predicament and inability to escape from perdition are no less excruciating. They however fail to evoke any sympathy. They only induce a mild discomfort, period. A parallel exists here with his own personal fate. He was lost to Belgium, the country he was born: France, which made him, could not care less for him; Switzerland, where he spent the past twenty-five years, was a mere tax haven. His characters walk alone, tucking within themselves the darkness of their spirit. For Simenon too, it has been a lonely trajectory. He had few friends. Even though he might have slept, as he claimed, with ten thousand women, there were really few who, toward the end, could offer him some requited passion, if it was passion he was looking for. He was, till his death, altogether unlovable. Despite his death, the verdict remains the same.

And yet, with what gall does one dare to repudiate the genius of this writer, or pretend to make light of the splendour of his prose and of the ferocity with which he dissected the tissues and arteries of the human soul? Many will of course continue to scoff at the genre he preferred. Simenon learnt early to count money in the countinghouse. That was not the reason though why he opted for the *oeuvre* of crime and detection. It was not just that he was amoral, it was for him a matter of the deepest non-faith. He got nihilist pleasure in spurning the accolade of society ma'rms, including the ghastly ones who preside over stylised *salons*. Here was, Gide was convinced, another Dostoevsky in the making; all that was necessary was a modulation in pace. Simenon would not be trapped; he persisted in his waywardness. The concerned Nobel committee would have been horrified were the suggestion ever to travel up to them to consider him for the literature award. Once more, Simenon could not have cared less.

His novels usually reach their climacteric within a space of thirty to forty thousand words. Conventional notions die hard, or refuse to die; great poetry can be created within the confines of such limited space, but not, it is alleged, great fiction. So, Gide notwithstanding, the issue is still an open-ended one: can one reach Dostoevskian heights and yet reject the Dostoevskian format? The towering Russians, including Tolstoy, used to take a decade to produce a novel; valleys and mountains of emotions undulate slowly, lugubriously; there are careful, crafted arrangements and re-arrangements of plots; unending confrontations of characters; adaptations, settings, transformations; preludes, overtures, intermezzos, finales; an intricate, methodically woven texture declared to be perfect only after all the rituals of classicism have been observed to the full. The times are different, the man is different; Simenon chooses otherwise, he is for the miniature. It is a challenge, the anatomy of the human soul must be encapsulated in a hundred liberally spaced pages. He therefore strips his prose for action. Genius is what genius does, he has a way of unfolding an ambience with a bare couple of sentences. Quite transparently, he is in a hurry. To try to establish a nexus between this and his instinct for money-making will be sheer illiteracy. This man is in a desperate rush, he is trying it out over and over again, he wants to grasp the nettle of what to him is the basic *quaesitum*. The evil grafted in the human soul fascinates him. What are its ingredients, do these vary from individual to individual, or from situation to situation? Besides, is evil at all distinguishable from what passes as good and civilised? Crime is the violence one individual or a group of individuals perpetrates against another individual or another group of individuals; it is a kind of consummation of the impulse to conquer and subjugate. But is this not what love too is about? Should we not be impressed by the coincidence, by this overlap between love and evil, as religious preachers define it, or crime, as the police code defines it? Each time, Simenon is dissatisfied with the whispers and responses he comes up with. He cannot make up his mind whether evil is commonplace, and therefore less interesting, or whether it does indeed embody greatness. He is unable to commit himself either way; there is not enough dialectical evidence on the basis of which to clinch

a judgment. So he keeps digging. Again and again and again, he returns to his *quaesitum*, the characters change their descriptions and their milieu, but in effect nothing is changed, the probings remain what they always have been: what is love, what is hate, what is passion, what is carnality, what lies at the root of the urge to destroy another human soul, or—which is essentially the same thing—to destroy another human body? Since the knowledge is still imperfect, the final verdict must wait. An interlocutory message however filters through: interpersonal relations are a mere veil; underlying the so-called social reality is another, more crucial, species of reality, a condemned human being is not necessarily evil incarnate, for the concept of evil itself is beyond the pale of understanding. Simenon gropes and gropes, providing the rationale for the one hundred twenty-fifth Maigret to be followed by the one hundred twenty-sixth, and the one hundred thirty-ninth non-Maigret by the one hundred fortieth, and *passim*.

Would one be permitted to add a further comment? Simenon and Sartre were exact contemporaries. Perhaps Sartre detested Maigret, and the compliment was perhaps returned. Perhaps they did not ever meet; at least no documentary evidence suggests that they did. But such non-accidents are an irrelevance; whether or not he liked Sartre, Simenon was unable to escape from an existential fate.

Feminists, as well as conventional defenders of human rights and of human dignity, have much *prima facie* reason to condemn Simenon from the depth of their heart, because of the manner in which he treated his women, not so much in his works of fiction, but in real life. Civilisation as we define it will refuse to tolerate his attitude. He behaved abominably badly with his mother, a frail, timid, honest, little, indigent widow, who did her utmost to give her son a decent start in life. The nonchalance with which he cheated his first wife, and his utter lack of any sense of guilt for it, would sicken even many of his quasi-sympathisers. And perhaps one receives one's just deserts right here, without the formality of a waiting time. His second wife was a shrew and worse, and provided Simenon with a taste of a season in hell. For years on end, he sought to escape, and could not. He got his deliverance after a long hassle, but on financially disastrous terms. It was still not the end of the story, the other sex had an even more devastating revenge in store for him. His father-fixated daughter wanted to have him all for herself, she would not flinch from effecting a physical conquest even; a horrified Simenon ran for cover; the daughter ultimately took her life. This shattered Simenon. His confidence evaporated, his style lay in ruins, but there had to be the *memoires intimes*. Read the book once more, it is really a confession box, a once and former granite of a personality, now crushed into smithereens, rambles inanities, and exhibits a self-pity which, alas, provokes, scorn and zero compassion.

If only the liberationists would suspend their anger for a moment, there might be an alternative hypothesis. Could it be that Simenon's interminable sleepings-about were a manifestation of the same restlessness which drove him to produce, at the end of every three months, yet another novel on the indescribability of the agony colonising the human soul? He passed from one woman to the next, but this was perhaps no run-of-the-mill seeker after carnal knowledge, he was merely trying to reach out to the subterranean mystique of man-woman relationship. No question a failed seeker, does that by itself render him into a villain?

The questions keep churning upon themselves. Is it evil for a man to seek the knowledge of a woman, or for a woman to seek the knowledge of a man? Is it evil to attempt to break down the barriers of resistance fellow beings build against one another? How does one define crime, what do confessions amount to when what one confesses to is a superficiality, an act which somehow saves the outward dignity of the social mores, such mores however have ceased to be relevant for an individual who has already crossed the rubicon and belongs to the other side, and how can it be proved that the other side is irretrievable darkness when one's existential wanderings have failed to come up with any absolute criteria for defining good and evil?

Maybe there was another kind of inner yearning, maybe he, every now and then, badly wanted to come in and join the domestic scene. How does one otherwise explain the fidelity of his portrayal of Madame Maigret? She is calm, placid, oozing with the sweetness of life, mothering Maigret as he returns, afternoons and evenings, battered within himself, befuddled by his confrontation with newer evidences of the precariousness afflicting the human soul. Who knows, perhaps Simenon himself was drawn to the domesticity reigning the dull, cramped Boulevard Richard Lenoir apartment presided over by Madame Maigret. But he did not belong.

The mystery is unresolved. Was he himself evil, or was he only interested in evil, in taking it apart, finding out what makes it tick? The other puzzle too remains. Was he a hack writer of pulp who just happened to strike it rich, or was he one of the greatest of the literary giants to walk the century now whimperingly coming to an end?

UN and India's Preventive Detention

A G Noorani

By participating in the adoption by the UN General Assembly of universal "principles for the protection of persons under any form of detention or imprisonment", the government of India has accepted a solemn international obligation. The people of India eagerly look for signs of fulfilment of this obligation.

ON December 9, 1988, the UN General Assembly adopted *without a vote*—that is, *with* India's concurrence—a "body of principles for the protection of all persons under any form of detention or imprisonment". It was the result of a typically UN effort—laborious and of limited value. On December 15, 1980 the assembly had assigned the task of preparing a document embodying such principles to "an open-ended working group" which predictably took its own time.

While some of the principles are progressive, others, as Christopher Avery of Amnesty International's Legal Section has pointed out in an analysis, "were weakened during the drafting process to a point that they duplicate or even fall below the level of already existing international standards".

India explicitly made a reservation in regard to preventive detention while ratifying the International Covenant on Civil and Political Rights in 1979. But in 1988 it became a party to the adoption of these principles. It has recognised their relevance as well as their international character and in consequence has assumed international responsibility for their observance. Herein lies the value of the principles despite their limitations.

The principles apply to an "imprisoned person" defined as one deprived of personal liberty as a result of conviction for an offence as well as to a "detained person" defined as one so deprived "except as a result of conviction for an offence". So it applies very much to preventive detention.

Principle 4 is important. "*Any* form of detention or imprisonment and *all measures affecting the human rights of a person* under *any* form of detention or imprisonment *shall be ordered* by, or be subject to the *effective control* of, a judicial or other authority" (emphasis added). This is very widely worded and includes any form of detention or imprisonment. To comply with this principle, it is imperative that detention is either ordered by or effectively controlled by "a judicial or other authority". Before New Delhi rubs its hands in glee it would do well to read the definition of "a judicial or other authority" at the very outset in the principles. These words are defined to mean "a judicial or other authority under the law *whose status* and tenure should afford *the strongest possible guarantees of competence, impartiality and independence*" (emphasis added).

The advisory boards as presently constituted to hear representations against preventive detention do not fulfil these criteria. They might have if the government had made a notification to bring into forces 3 of the Constitution 44th Amendment Act, 1978 which amended Article 22 of the Constitution to provide that (a) the advisory board must be constituted in accordance with the recommendations of the chief justice of the high court concerned; (b) its chairman must be a serving judge of the high court; and (c) the other members must be either serving or retired judges of any high court. Ten years have elapsed since the amendment act came into force but the government has set the legislative will at naught by not bringing this solitary provision into force. The Supreme Court had ample of opportunity to set this wrong right. It has altogether failed to do so. Now any lawyer, even a party hack, can be appointed chairman or member of the advisory board.

Be it noted that the principles apply to all persons under any form of detention or imprisonment; they apply to all countries; at *all* times, normal or a state of emergency; they are not merely advisory but provide practical safeguards against abuse of power and envisage concrete state action to implement them. Principle 7 is clear: "States should prohibit by law any act contrary to the rights and duties contained in these principles, make any such act subject to appropriate sanctions and conduct impartial investigations upon complaints". This is a solemn international obligation accepted unanimously by all the members of the UN, India included. We look forward eagerly to any signs of its fulfilment.

Principle 11 says that a detained person must be granted prompt hearing before "a judicial or other authority". It adds "a detained person *shall* have the right to defend himself or to be assisted by counsel as prescribed by law". The law can only prescribe the manner of exercise of the right. It cannot deny the right itself. Our Supreme Court has not been too enthusiastic in recognising this right, to put it mildly.

Principle 17 is equally explicit—"a detained person shall be entitled to have the assistance of a legal counsel." The National Security Act contains no such provision. Neither does Article 22 of the Constitution.

Principle 20—which, to repeat, India has accepted along with the rest—reads thus: "If a detained or imprisoned person so requests, he shall if possible be kept in a place of detention or imprisonment reasonably near his usual place of residence."

Principle 35 says that violations of "the rights contained in these principles shall be compensated according to the applicable rules on liability provided by domestic law." The law cannot deny the right. It can only prescribe the pertinent "rules on liability".

If the government of India does not observe these principles in practice or refuses to secure the necessary enactment the conclusion will be irresistible—it was guilty of sheer hypocrisy and moral cowardice when on December 9, 1988 it accepted these principles before the world body.

Sudarshan Chemicals Industries

SUDARSHAN CHEMICALS INDUSTRIES, Pune, has shown good working results for a year ended June 30, 1989 and the directors have recommended a higher dividend @ 25 per cent as against 20 per cent in the previous year. Sales and other income have increased to Rs 652 million during the year against Rs 492 million in the previous year and the company has earned a gross profit of Rs 65 million against Rs 44 million. Profit before tax is Rs 32 million (Rs 21 million) after providing depreciation of Rs 34 million (Rs 25 million). The proposed dividend will absorb Rs 7 million (Rs 5 million). The company has entered into a collaboration with Dianippon Ink and Chemicals of Japan. The government of India has approved the collaboration with equity participation at a premium.

THE DHARAMSI MORARJI CHEMICAL COMPANY LTD.

Registered Office: Prospect Chambers, 317/21, Dr. Dadabhoy Naoroji Road, Fort, Bombay 400 001.

Shri R. M. Goculdas

Speech delivered by the Chairman, Shri R. M. Goculdas, at the Sixty-ninth Annual General Meeting of the Shareholders held on 25th September 1989.

Ladies and Gentlemen,

I welcome you to the 69th Annual General Meeting of the Company. Since you have already received the Annual Report with the Audited Accounts and the Directors' Report for the year ended March 31, 1989, covering a period of fifteen months, I may be permitted to take them as read.

Economic Scene:

When we met last year, the country had witnessed for three successive years, unprecedented drought. The economy was passing through the most difficult time. Owing to the bountiful monsoon in the year 1988-89, the economy staged a dramatic recovery, reflecting its basic resilience and vigour. Agricultural production touched a new record estimated at over 170 million metric tonnes. Recovery of agriculture provided tonic for the industry. The growth rate of industrial production is estimated to have jumped by almost 10%. For this remarkable performance the Government deserves to be complimented for continuing its well conceived policy of liberalisation of industrial licensing, relaxation of controls on price, distribution and trade, and judicious use of fiscal and credit policy. The Government's steps to promote both growth and efficiency by stimulating competition, technology acquisition and modernisation paid rich dividends.

With the prospect of good monsoon this year, there is a spirit of optimism reflected in the excellent corporate performance and buoyant conditions in the capital market. The impressive all-round performance of the economy is certainly heartening. It augurs well for the country when it is on the threshold of launching the Eighth Five-Year Plan.

Period under Review:

The performance of the Company during the fifteen-month period has shown considerable improvement over the previous year, and on an annualised basis, the growth in sales is 27%, and in gross profits it is 45%.

As a result of the satisfactory monsoon, there has been an increasing demand for fertilisers. The performance could have been better but for problems in the receipt of raw materials at Bombay Port during the monsoon period as a result of congestion which not only affected the regular inflow of rockphosphate and sulphur to our plants, but also resulted in payment of heavy demurrage and lighterage charges which are not reimbursed in the retention price to the manufacturers. As a result of government's concern about mounting financial burden of fertiliser subsidy, many of the factors referred to in my last year's address continued to affect the profitability of single superphosphate (SSP). However, the plentiful monsoon this year in most parts of the country, coupled with limited availability of DAP, has resulted in a strong demand for Phosphatic fertilisers in general and SSP in particular. As you are already aware, your Company is the largest manufacturer of SSP in the country.

Sale of Chemicals:

The figures of turnover for the first five months of this year indicate an increase of about Rs. 300 lakhs over the corresponding period for the previous year. The whole of the increase is due to higher sales of chemicals. I referred to in my speech last year that we were targetting to enhance the production of chemicals sales from 40% to 60% of the total turnover. This is, therefore, the first step in that direction. The higher sales of chemicals have been achieved by debottlenecking your Company's 620 MT per

day capacity Sulphuric Acid plant at Ambarnath, which has resulted in an increase of 10% in production and also the production of Chlorosulphonic acid at Kumhari.

Our further efforts in this direction will be to start the production of Benzene Sulphonyl Chloride and Thiophenol at Roha, for which all the necessary licences have been received. These two chemicals, besides having local as well as export market, are used in the manufacture of a fungicide, Ediphenphos, which prevents attack of blast on paddy. Since we have received the necessary registration for Ediphenphos we shall take up its manufacture during the next year.

Roha Floods:
Some parts of the Company's factory at Roha were flooded due to very heavy rains on July 23 and 24, 1989. For the first time since the construction of the Company's factory at Roha 12 years ago, the flood waters entered the factory and washed away some of the stocks of raw materials and finished goods and caused damage to one of the plants. However, efforts put in by our engineers on an emergency basis enabled us to re-start the plant in 10 days.

Future Expansion:
As you already know, the Company had an industrial licence for putting up a Sulphuric acid and single Superphosphate plant at Amreli, which is a notified backward area in the Saurashtra region of Gujarat State. Since this will be the first major industry of its kind in the district, it has qualified for pioneer status, thus becoming eligible for tax benefits and subsidy applicable to backward areas. I am glad to inform you that this licence is now being implemented, and the single Superphosphate plant will be in operation next month. As regards the Sulphuric acid plant, this should be ready by the end of March 1990. We also intend putting up a Chlorosulphonic acid plant at Amreli for which an application has been submitted to the Government. The total cost of the project will be about Rs. 9 crores and is being financed by a loan of Rs. 5.90 crores from financial institution and our bankers, and the balance from our own resources. This project will increase Company's annual sales by 15% and add considerably to our profits.

As you will notice from the Directors' Report, the production of Chlorosulphonic acid at Kumhari has stabilised. At the moment, the Chlorosulphonic acid produced is being supplied to the existing customers in Western India. Since the plant at Amreli will also be producing Chlorosulphonic acid for the Gujarat market, I consider it desirable to utilise a part of our production at Kumhari for the captive consumption in the manufacture of value-added down stream products. A project for the production of Acetyl Sulphanilyl Chloride, an important intermediate for sulpha drugs, utilising the process developed by our Company's R & D Division, is under implementation and I expect the plant to go into production by the middle of next year.

I am glad to inform you that only last week, we have been issued a Letter of Intent for putting up a plant for the production of 1,00,000 tons per year of Sulphuric acid at Roha, alongwith oleums and Sulphur Trioxide. A major part of the production at this location will be utilised in our various plants at Roha, and the balance will be sold in nearby markets. According to a recent notification of Government of Maharashtra, the manufacturing units located in the industrial area at Roha have again become eligible under the package scheme for tax incentives and subsidy. Our new plant will be eligible for the same.

Exports:
During my recent visit to Europe, I have finalised arrangements for the export of Sulfamic acid to England, Germany and Switzerland. Our present efforts are going to be for the export of about 3,000 tons and this will result in foreign exchange earnings of about $ 2 million per year. Our existing plant which is meeting the local requirements, is now being expanded to meet export requirements, and will be in operation by the end of this year.

Pollution Control:
With the installation of highly efficient scrubbers on the SSP plant at Ambernath, the emission levels of Fluorides from the stack were brought down to well below the MINAS standards stipulated by the Pollution Control Board. In the current year it is intended to reduce Sulphur Dioxide in the stack gases of the Sulphuric acid plant. The SO_2 concentration is already within the limits stipulated. However, in order to further reduce the emission level, your Company obtained technology for Alkali Scrubbing of SO_2 from Nissan Engineering Co. Ltd. of Japan, under the Technical Development Fund Scheme. The alkali scrubbing unit is being commissioned this month. This will be the first plant in India to employ such technology and control SO_2 emission to such stringent levels.

Current Year:
As you have already noticed, 1988-89 has been a good year. I can assure you that with the addition of the value-added chemicals which we will be producing, I feel this year to fare even better. Finally, I thank my colleagues on the Board for their valuable guidance and all the employees for their co-operation and hard work throughout the year, which has contributed to the growth of the Company.

Thank you.

NOTE: This does not purport to be a report of the proceedings of the Annual General Meeting.

ASSAM

Centre's Game in Bodoland Agitation

Evidence now available from different sources shows the extent to which institutions charged with maintaining peace and order have been deliberately suborned by the central government to further its machinations against non-Congress(I) state governments

IF there is even a modicum of truth in the various allegations made by spokespersons on behalf of the government of Assam, from the chief minister downwards, about the dubious role of some central intelligence agencies in the ongoing 'Bodoland' agitation by the All Bodo Students Union headed by Upendranath Brahma (ABSU-UB), the whole situation calls for the sharpest condemnation. For what chief minister Mahanta and others in his government have been saying is simply this: that the government of India itself has not merely encouraged the 'Bodoland' agitation, but assisted the agitation actively by providing *matériel* and expertise of the kind generally provided to the sappers and miners of the Indian army to the ABSU-UB agitationists. In other words, the actual responsibility for the continued killings, bomb blastings, and other acts of sabotage going on in Assam has to be laid at the door of the government of India itself.

These are grave charges. Chief minister Mahanta had detailed these in a letter to Rajiv Gandhi, drawing the prime minister's attention to a document issued by an organisation called Forum for Restoration of Civil Liberties in RAW which, among other things, alleges that RAW has specially earmarked Rs 3 crore from its secret funds for an operation code-named 'Zoom-Zoom' connected with the 'Bodoland' agitation. The document names names and gives dates of other activities of RAW operatives in connection with the ABSU-UB agitation. Till today, the prime minister has not responded to the letter of the Assam chief minister; like the stance adopted by another shady character who has been in the news in connection with the alleged illegal foreign accounts maintained by V P Singh, these allegations have been 'neither confirmed nor denied' by the prime minister.

It is likely that these charges levelled by some employees of RAW are of a self-serving variety for it is difficult to believe that persons who have loyally served the organisation all these years and also possibly have been the instruments of its black deeds have overnight become virtuous votaries of democratic practice. But other details provided by the state government itself about the possible involvement of the clandestine agencies of the union government have not been refuted either. Of this, the most serious case cited by the state government is the blasting of the RCC bridge over Gauranga river in Kokrajhar district on August 12 this year. This bridge, like many other similar strategic bridges in the north-east, apparently had an in-built demolition box; and the demolition charge was supposed to be set off in the event of the territory being overrun by the Chinese or other foreign forces. The fact that the bridge had an in-built demolition box, its precise location and the technique of triggering off the charge was supposed to be known only to the personnel of the Special Services Bureau (SSB) and the Special Frontier Force (SFF), two of the presumably many fighting arms of RAW in the north-east. Even the explosive charge, IOC Superdyne, is not something one can pick up in the market, being an explosive whose manufacture and distribution is strictly controlled by the government of India. And yet, the bridge was blasted allegedly by 'ABSU-UB militants'.

Perhaps, like the disgruntled RAW employees, these revelations by the Special Branch of the state police too are self-serving. This is not the first time that the Special Branch of a state police force has spilled the beans on the dirty doings of a central outfit. But there has been yet another charge of involvement of a central agency in the ABSU-UB agitation, this time by no less a person than the state's chief secretary. The ongoing controversy between the Central Reserve Police Force and the state government about what precisely happened on August 10 at the Gohpur reserve forest is yet to be resolved. The chief secretary of Assam has suggested that if more than the twenty-odd persons officially admitted by the government of Assam to have been killed in the clashes in the Gohpur area in the second week of August died in those incidents, then they were probably killed by the CRPF itself which was engaged in a little-noticed encounter in that area on August 10. This extremely serious allegation which in effect accuses the CRPF of suppressing evidence of its own culpability and foisting the responsibility for the alleged killing of nearly a hundred persons in that area on the government of Assam has of course been rebutted by the CRPF. But since both the allegations and the rebuttal are issued by institutions swearing by the national motto of *Satyameva Jayete*, truth itself has become a mere verbal commodity in these exchanges. The further accusation by the state government that the CRPF, whose forces in the region are presently commanded by an IPS official who also happens to be a Bodo, is now openly siding with the ABSU-UB militants shows the extent to which institutions which till recently were (perhaps rather innocently) held to be relatively free from the kind of pressures and prejudices those operating directly under state governments were supposed to be subjected to, have themselves been totally suborned by the union government itself.

The first time (allegations of RAW involvement) may be chance and happenstance; the second time (the blasting of the Gauranga bridge) may be coincidence; but third time (allegations of CRPF involvement) cannot be explained away as once more chance or coincidence. Further, these suborning of institutions in the north-east also fits in with the similar phenomenon being noticed elsewhere in the country. For long, in any disputed action of the government, or in the case of any unsolved crime, the prescription used to be: hold a judicial inquiry; or hand it over to the CBI. The developments in the last few years, rather more blatantly during the prime ministership of Rajiv Gandhi, have shown what knocks these once innocently-presumed stainless reputations have taken. If the government of Assam now levels accusations against institutions which were set up with the professed objective of protecting the state and its people against external agression and subversion (RAW and its agencies) and internal strife (paramilitary forces like the CRPF), it is only waking up to the largest Indian reality. As always, there is no escaping joining the mainstream.

Right Judgment, Wrong Time

Radha Iyer

While it will go some way to lift the flagging morale of trade unions in Bombay, the recent judgment of the Bombay High Court on dearness allowance is both anachronistic and ironic.

THE judgment of a division bench of the Bombay High Court in the matter of ceiling on dearness allowance has to a small extent helped to lift the flagging morale of trade unions in Bombay. In the recent years, due to changes in the industrial policies relating to geographical relocation, automation, import policies and extensive sub-contracting, industrial workers in Bombay have been facing closures of units, stagnation in employment levels, reduction in workforce, and a general sense of insecurity. Often terms and conditions of service which had been won after years of struggle in the days when their companies looked to the Bombay units as the principal source of profits are now sought to be rewritten. In this context, the judgment of the division bench is anachronistic as well as ironic.

The judgment which was passed in an appeal filed by the monthly-rated staff of Hindustan Lever against the company raised a fundamental question regarding the principle relating to wage fixation, namely, whether there could be a ceiling on the dearness allowance paid to employees. The judgment has reiterated the basic principles on which the concept of dearness allowance was founded—principles which had been followed, but over the years had got rather blurred. The judgment lays down or rather reiterates four basic principles relating to dearness allowance. Firstly, DA neutralises the rise in the cost of living in relation to the basic wages paid in the base year, i e, the year the basic wages were fixed. Any rise in the DA must therefore be linked not only to the rise in the consumer price index but also the basic wages. Only then the erosion in real wages could to some extent be stemmed. Secondly, since prices could not be controlled, there was no justification for any ceiling on dearness allowance. Thirdly, the argument that rise in wages lead to inflation and therefore the workers must sacrifice in the larger interests of society by reduction in their dearness allowance was not based on any scientific data and courts at least could not accept such propositions. Further, since there was nothing to show that all sections of society were being called upon to make such sacrifices in the larger social interest, there was no justification for asking workers to do so. Fourthly, existing benefits could not be taken away from workers in the absence of compelling reasons.

The judgment is anachronistic in a sense because of its timing and the general trade union situation existing today. The issue of a ceiling on dearness allowance had been the most crucial issue facing trade unions in the organised sectors of industry throughout the seventies. Since the early seventies the demand for a ceiling on dearness allowance began to catch on. It was granted in most cases by courts and often accepted by trade unions with a view to getting short-term benefits. In this context, the principle of ceiling dearness allowance was questioned in the Supreme Court by the employees of Killick Nixon. In that case the Supreme Court had laid down a number of considerations which should be followed when deciding the issue. It identified fourteen points for consideration including points such as capacity of the company to pay, whether it disturbs the parity *inter se* employees and *inter se* employees and managerial staff, whether existing patterns over-neutralised employees in the matter of dearness allowance, etc. At the end of it the Supreme Court approved of the ceiling on dearness allowance, with the qualification that it was in relation to the facts of that case. Even so the Killick Nixon case, decided in 1975, served as a great morale-booster for employers. Everywhere the employers began to insist on ceiling on dearness allowance with greater confidence. On a rough estimate at least 50 per cent of the larger companies in the organised sector introduced ceiling on dearness allowance in some form or the other. (A rough working definition of a large company could be companies covered by MRTP Act.) Besides, the banking industry introduced it for the entire industry. This runaway tide was stemmed to some extent by the judgment of the Supreme Court in the Indian Hume Pipe case decided in early 1986. There the Supreme Court held that if systems of dearness allowance had been existing continuously for years and there were no compelling circumstance there could be no ceiling on dearness allowance. While reiterating the principles of the Killick Nixon case, as a matter of fact in the Indian Hume Pipe case the court refused to seal dearness allowance. The Bombay High Court's judgment goes further, since it reiterates the very concept of dearness allowance and the fundamental principles on which the concept is founded. Thus it puts back dearness allowance to its proper place. Unfortunately the decision has come at a time when the question of ceiling on dearness allowance no longer dominates the trade union scene. Had the same principles been laid down in the Killick Nixon case in 1975, the entire pattern of wages in larger companies might have undergone drastic changes and they would have been founded on consistent principles. For, even though the ceiling on dearness allowance came to be fixed, the demands for wage increases continued. Often these were granted in the form of *ad hoc* allowances like house rent, education allowance, travelling allowance and the like. These allowances become the principal mode of securing wage increases and had no nexus with the ostensible purpose for which they were granted. These trends totally distorted the wage structure and introduced irrationalities.

Both for the employees of Hindustan Lever and the employees of the organised sector in Bombay the timing of the judgment is ironic. In Hindustan Lever itself, the demand for a ceiling on dearness allowance had been referred for adjudication in 1969 for the first time. At that time the question of ceiling on dearness allowance was a crucial issue. Today the issue is of job losses and shifting of production from the Bombay factory to other locations. The employees are anxious about the decline in the position of the Bombay factory in the overall structure of the company and, therefore, a decline in their relative bargaining strength. This is the case in most of the larger companies. Since the workers in the larger companies in the organised sector in Bombay are preoccupied with protection of jobs, the judgment could hardly have an unsettling effect on the industries as apprehended by many employers in their public comments on the judgment.

Having said this, it may be useful to examine what factors brought about this change in the perception of the question of ceiling on dearness allowance on the part of the courts. The case for ceiling on DA was pegged on the argument that the organised sectors of industry were becoming islands of high wages. Employers' organisations prepared well documented studies to show the judges of lower courts, civil servants, teachers and professors, scientists and other sections of society were paid less than workers in organised industry. The Fourth Pay Commission to a large measure rectified such anomolies. The Pay Commission for the first time accepted the principle that for the lowest paid employees, a 100 per cent neutralisation in the rise in the cost of living index was justified. It fixed such a level of incomes as being up to Rs 3,500 per month. By implication, the subsistence wage justifying a 100 per cent neutralisation in the cost of living could be up to Rs 3,500. With the increase in the salaries of civil

servants and other sections of salaried employees the theory of high wage islands lost its rationale. The impact of the Fourth Pay Commission is thus unmistakable.

In conclusion it must also be said that when the issue dominated industrial relations the trade unions in a premier industrial city like Bombay could not come together to fight unitedly. Even though the issue was all pervasive each union tackled it at the level of its own plant or company, and by and large relied upon the courts to pronounce upon an issue so basic to them. The judicial machinery being what it is it has taken 20 years to decide the issue in Hindustan Lever. In case the company chooses to appeal against the judgment, the dispute could continue. It is possible that on the issues that dominate industrial relations in the city today, such as job losses, restructuring and transfer of production to other regions, the courts may pronounce on the rights of workers twenty years hence. Until then will the unions continue to remain concerned only with their own units or companies? Will they see only the trees and refuse to look at the wood?

TAMIL NADU

Health Priorities

J W Thomas

Madras city is already endowed with many medical centres of excellence and is situated on the northern-most tip of the state. So locating the new MGR Medical University in a district centre like Tiruchi or Madurai, instead of in or around Madras, will give a fillip to the development of well-equipped medicare and training institutes in the districts where the need is greater for such facilities.

THE president R Venkataraman inaugurated the MGR Medical University in Madras on August 31 as an apex institution with colleges and institutes of medical education, training and research affiliated with it. It is to be renamed MGR University of Health Sciences shortly.

In his inaugural address the president emphasised the need to close the great divide between rural and urban medicare, preventive and curative care, the need for a larger number of generalists in India and the need to provide simple and inexpensive medicare to the rural poor. He said, "while there is need to consolidate, more than expand, the facilities for educating and training doctors, there is a glaring need for expansion of training of para-medical personnel and technicians". For instance, while India produces 14,000 doctors a year and only about 9,000 nurses are trained, the actual need for nurses is over three times the number of doctors. The state governor P C Alexander said that a mere increase in the number of doctors would not solve our health problems and that the Chinese and Vietnamese system of having a "chain of health assistants" to serve as a link between the people and the limited number of doctors would be more appropriate for India. Chief minister M Karunanidhi assured implementation of the recommendations of the Ramamoorthi Committee Report on medical education and health care submitted to the government recently. Among other proposals, the committee has recommended upgrading of social and preventive medicine, PG courses in community medicine and general practice, BSc course in health education and more BSc courses for nurses, setting up of an Institute of Para-medical Courses, increasing pharmacy seats and upgrading dental departments in medical colleges, augmenting the number of ophthalmologists and ENT doctors, improving facilities in taluk and district hospitals, continuing medical education for medical officers in district hospitals, etc. In short, the president, the governor and the chief minister have implied that reaching the goal of 'Health-for-All' by 2000 AD has to be the paramount consideration.

The new university has drawn up an ambitious plan to set up 12 research institutes at a cost of Rs 400 crore during the Eighth Plan period. For the establishment of these research institutes and administrative complex, the university has identified about 450 acres of land in and around Madras and has approached the government for allotment.

At present, almost all the medical centres of excellence are located in metropolitan Madras. Apart from four medical colleges and teaching hospitals, the recently set up Tamil Nadu Medical Science and Research Institute, 'Tamarai', with a 1000-bed hospital is located in suburban Madras. Tamarai medical college is to progressively reduce the intake of undergraduates so as to make it a post-graduate centre for education. The Madras Medical College has already been upgraded as a PG Institute of Education and Research. Many speciality and super-speciality directorates and institutes, with the most modern and sophisticated equipment, are situted in Madras. The PG Institute of Basic Medical Sciences is also located in Madras. Thus, the lion's share of the health department's annual expenditure goes to buildings, equipment of medical institutions and hospitals in and around Madras. The Anna University Complex in Madras has developed a PG programme of biomedical engineering to train engieering graduates in maintenance of sophisticated and modern equipment in hospitals and provide technological support to doctors. Locating the new health university with its Rs 400 crore investment programme in Madras will further add to the concentration of modern medical facilities in the Madras urban complex.

In this context, the state government and the new university need to prioritise the various proposals and draw up a time-bound programme. Taking into consideration the present realities and the severe resource constraints, the health priorities for the next five years should be as follows: democratise access to health care by reducing the wide gap between metropolitan Madras and the rest of the state, between rural and urban care, preventive and curative care, generalists and specialists, para-medics and doctors; improve facilities in para-medical training institutes and medical colleges located in the districts; create additional para-medical training facilities in the districts to overcome shortages of nurses, dentists, pharmacists, physiotherapists, health educators, technicians; establish the requisite number of PHCs and sub-centres in an accelerated manner; consider the governor's suggestion on the need for trained 'health assistants' in the rural health care infrastructure; expedite construction of the Salem Medical College, foundation for which was laid a year ago; improve facilities in the teaching hospitals located in the districts and bring them on par with those in Madras, as the common people have now to traval long distances to Madras for treatment of major ailments and speciality care; rapidly improve the facilities in the taluk, non-taluk and district hospitals.

The MGR Health University has a vital role to play in reducing gaps and imbalances, dispersing medical education and research facilities and medical talent, taking health care nearer to the vast majority of the people, encouraging research in area-specific diseases, and achieving the goal of 'Health-for-All' by 2000. Madras is already endowed with many medical centres of excellence and is situated in the northern most tip of the state. So locating the new university in a district centre like Tiruchi or Madurai will give a fillip to the development of well equipped medicare and training institutions in the districts where the need is greater for such facilities. It may be mentioned that in Andhra Pradesh, the newly established AP University of Health Sciences is located in Vijayawada, not in the state capital.

Rallying against Planned Disaster

Denis Rodrigues

It is becoming increasingly clear that the Sardar Sarovar Project is not just an isolated example of bad planning and bungling but only one instance of an intrinsically flawed process.

ON September 28, an estimated one lakh people are expected to gather at Harsud, a small town near Khandwa (MP), to pledge their opposition to the current development ethos in the country, which has proved itself to be neither socially beneficial nor environmentally sustainable and which raises serious unanswered questions about the long-term economic viability of such projects.

Harsud is in the submergence zone of the Narmada (Indira) Sagar Project, which very recently has been given clearance by the Planning Commission when even the World Bank is having second thoughts about the project. Harsud was chosen as the site of the rally as a symbol of the mindless and unconscionable loss destruction that is being wrought in the country, in the name of development. The rally has been co-sponsored by more than 150 organisations from all over the country, covering the entire spectrum of social activism and politics. It is supported by activists, scientists, academicians and ordinary folk, all sharing a common concern about the direction taken by our planning policy and the methodology implicit in the development process.

The rally has emerged, or rather evolved out of the opposition to the Narmada Valley Development Project, and more specifically the Sardar Sarovar Project (SSP). It began initially as a struggle for a proper implementation of rehabilitation measures as laid down in the theoretically excellent formulations of the Narmada Waters Dispute Tribunal and the World Bank Agreement with the Gujarat government. Later, however, this changed to a stand of opposition to the dam itself, when it became apparent that while rehabilitation programme was unexceptionable on paper, it was unimplementable in practice. Preliminary studies of the economic, environmental, seismological and health effects of the project, only confirmed this stand. As it broadened its scope the movement itself became more eclectic, until today, the Narmada Bachao Andolan is an interdisciplinary coalition that challenges the very bases of the planning policy in the country. This final stage was a logical development. As contacts with other involved groups grew, it became increasingly clear that the SSP was not just an isolated example of bad planning and bureaucratic bungling but only one instance of an intrinsically flawed process that has promised much but delivered little. Yet through some kind of ideological inertia, the same kind of projects are being planned and executed despite all evidence, national and international, that they are no longer justifiable economically, socially, or environmentally.

One by-product of the agitation has been the exposure of the sinister role of the World Bank, as a partner in what has been called the 'biggest planned ecological disaster of the century'. The World Bank has played a key role in promoting such types of development plans for third world countries, for which it has come under increasing fire from sociologists and economists. In an attempt to refurbish its social and ecological image, it has formulated some fine sounding policies for resettlement of involuntarily displaced persons and the welfare of tribals—the celebrated OMS 2.33 and OMS 2.34. These lay down detailed and timebound conditions to be met in all World Bank funded projects. And it has constantly projected itself to be the only multilateral development agency with such an enlightened policy. In the Sardar Sarovar Project however, this self-acclamation came back to haunt the bank. Field organisations in India along with international environmental agencies flooded the bank with irrefutable evidence of the non-fulfilment of its self-imposed conditions. Its own investigative missions had no choice but to confirm these findings. But when it came to the crunch, the World Bank succumbed to political pressure and financial exigencies and extended credit even after its own consultant had recommended suspension.

The World Bank's volte-face despite acute embarrassment, is perhaps indicative of the enormous clout of the development lobby. At the same time there is a ground swell of discontent and opposition against the dominant development model. Harsud is an attempt to coalesce and concentrate all strata of this nationwide struggle. Peoples' movements from all over the country, including traditional fishermen fighting for a mode of operation that is economically and environmentally sustainable, as well as slum-dwellers struggling for their rights to decent housing, will rally together and pledge to overcome not only the pernicious practices that go with this development model, but also the underlying philosophy and ideology, that postulates economic growth as the sole developmental parameter, ignoring both social equity and ecological stability, or at most paying them lip-service.

growth in agricultural output was appropriately matched by the industrial and service sectors and the country witnessed a rare year of near double digit growth.

During this period the Company has maintained satisfactory growth, and pursued its business consistent with national priorities. In the seventy-one years of its existence, the Company has played a pioneering role in the development of the food processing industry in the country. The products of the Company have become benchmarks for determining and fixing quality standards for the industry.

FOOD PROCESSING INDUSTRY

In June 1988, the Government of India constituted a separate Ministry for Food Processing Industries and there could not have been a better time to initiate such a positive move. A greater flow of investment in food processing industries can yield very rewarding results in creating more opportunities for adding value to the country's primary produce and your Company welcomes this initiative of the Government.

Here, I would like to re-emphasise that along with creating new capacities and investments, there is a need to ensure that the existing companies in the business also grow and remain profitable. The business environment has to be conducive to the systematic growth of ongoing investments.

There are two areas of Government policy towards the food processing industry that have had a direct adverse effect on the Company's operations.

The ongoing policy of retaining a price control on bread in Delhi has done a great deal of harm to the development of the bread industry in the capital. I feel unhappy to raise this point this year as well but the bread situation in Delhi is progressively deteriorating and needs to be salvaged without any further delay. <u>As in all parts of the country, the price control on bread in Delhi should be withdrawn.</u>

Again, the Government must review its policy banning the import of oilseeds. The Technology Mission on Oilseeds has been a good success with the total oilseed crop reaching a record of 15.5 million tonnes in the last year. Inspite of this impressive performance, we are still short of our requirement of edible oils. The Government has bridged this gap by resorting to import of oils with a massive outflow of foreign exchange. Instead, if the Government permits the import of oilseeds by the industry, the industry would be able to fully utilise its installed capacity, much of which is presently lying idle, meet the local demand for edible oils and more than make up the outflow of foreign exchange by exporting the extractions.

IDENTIFICATION WITH SOCIAL RESPONSIBILITIES

The Company has always believed that the role of a corporate entity is not just to generate a return on investment but to be an active participant in the task of nation building. Our major thrust in exports and diversification into high priority areas arises from this sense of national commitment. This sense of direction in the Company also manifests itself in the support extended to a large number of socially oriented welfare projects. The Britannia Amritraj Tennis Academy of the Company has already become a national centre for excellence in that sport. The Company has also provided generous support to various projects for the promotion of art, culture, music and ecology all over the country.

THE FUTURE

The Company has had a glorious past and is working strongly towards a momentous future. The plans and projects under way will help to consolidate the Company's pre-eminent position as a market leader in superior quality consumer food products. Apart from the world of foods, the Company is also examining investment opportunities in other areas. The emphasis is on utilising the benefit of business synergies, the strengths of a strong infrastructure and seven decades of useful experience. "Britannia Gardens", the new Corporate Office in Bangalore, is now functional and provides a stimulating milieu for creative work.

THE TEAM

In February, 1989, Mr. E.J. Grinsted resigned as Managing Director of your Company to take up a senior overseas appointment with Nabisco. I should like to convey our deep appreciation of the contributions made by him during his tenure. We are fortunate that we will continue to have the benefit of his experience as he will remain a member of the Board. His successor, Mr. S.K. Alagh, has had a long association with your Company in various positions of responsibility. I have no doubt that he will further invigorate the growth and development of the Company. I have great pleasure in welcoming Sawai Bhawani Singh of Jaipur, MVC, who was invited to join the Board of Directors in October, 1988. He is a distinguished member of our community and brings with him a wealth of experience.

Since the last Annual General Meeting, Mr. N. Balasubramanian, Mr. V.K. Singh and Mr. Y.M. Khirwadkar resigned from the Board. I wish to record our gratitude for the active role played by them in the growth of the Company during the period of their association.

On behalf of myself, my colleagues on the Board and all of you, I thank our dedicated team of employees at all levels whose unstinted efforts and sincerity have made the success of your Company possible.

And to you, Ladies and Gentlemen, my thanks once again for your gracious presence this morning.

NOTE: This does not purport to be a record of the proceedings of the Annual General Meeting.

LINTAS BIN P 490 2417

Nagarjuna Fertilizers and Chemicals Limited

RACING AHEAD WITH IMPLEMENTATION

(Speech delivered by Shri Mantosh Sondhi, Chairman, at the 13th Annual General Meeting of the Company held at Hyderabad, on 13th September, 1989)

Ladies and Gentlemen,

I have pleasure in welcoming you to the 13th Annual General Meeting of the Company.

The annual general meeting is always an appropriate occasion to take a brief look at the state of our economy with particular reference to the situation of the fertilizer industry in that setting. Such a survey assumes additional significance in the context of the fact that the country is now at the threshold of the Eighth Five Year Plan.

Economic Scene

It may be recalled that even during one of the worst droughts of the century in 1987-1988, the fall in agricultural production was only about 2%. This was essentially due to the higher resilience that our agriculture has developed through the application of improved technologies to farm production.

Emerging from such a catastrophic situation the country registered a growth of 9% in GDP last year which is no mean achievement indicative of the basic strengths in our economic system. Aided by good monsoons, both agricultural and industrial production achieved high growth rates.

For a country that produced about 120 million MT of food grains only a few years ago, it is indeed a creditable achievement to have reached a production level of 170 million MT during 1988-89. We must, however, guard ourselves against any sense of complacency and proceed with unsparing efforts towards a target of 250 million MT by the turn of the century to feed our growing population. As it was once said, so pithily, we have to keep running even to be able to stay where we are.

Reports have recently appeared in the press that the draft approach paper for the Eighth Five Year Plan envisages a growth rate of 6% p.a. Well targeted efforts carried out with missionary zeal can put this goal within our reach. In a developing economy the sustenance for growth can be derived only from better management and efficiency at the macro and micro levels. At the micro level, the industry – be it the public or the private sector, because these really constitute the national sector – cannot escape responsibility for maintaining a continuously rising level of productivity to fuel further growth specially in a developing economy where incomes are hardly above the subsistence level. At the macro level, the Government must provide the necessary policy and procedural support congenial for implementation and timely completion of new projects and for industrial production to continuously expand and diversify.

Fertilizer Industry

Against this background, I am glad to say that the record of the fertilizer industry in discharging its socio-economic responsibilities has been creditable as evident from the growth of production from a bare 3 million MT of nutrients in 1979-80 to 9 million MT in 1988-89 which it has achieved not only through setting up new production units but also by raising the capacity utilisation from 67% for Nitrogen and 69% for P_2O_5 at the beginning of this decade to 85% and 87% respectively. The fertilizer industry has shown awareness of its strategic role in sustaining growth in agricultural production which is the very foundation of our economic progress.

> **Fertilizer being a critical input for self-sufficiency in food, the importance of our country attaining a high degree of self-reliance in the sector cannot be over-emphasised even if the demand-supply balance for fertilizer were to be easy in the international market.**

Self-reliance assumes criticality when we know that demand-supply balance in the next few years is difficult and is likely to cause difficulties in our ability to meet a short-fall of approximately 5 million MT of nitrogenous and phosphatic fertilizer materials by the mid-nineties unless the contemplated addition to capacity during the Eighth Five Year Plan actually fructifies.

Marketing Operations

I may now turn to your Company's performance and before dealing with the progress achieved in regard to implementation of the Project, I could mention briefly the success achieved on the marketing front.

> **The volume of urea sales during the year 1988-89 registered a 35% growth compared to the previous year. The turnover rose from Rs. 33.33 crores to Rs. 44.74 crores.**

Profit before taxation increased from Rs. 83.74 lakhs in the previous year to Rs. 95.05 lakhs in the year under review without taking into account any reimbursement from the Government for the cost of carrying the stocks imported prior to the introduction of the system of periodical compensation of inventory carrying costs. An ad hoc ex-gratia payment had been granted by the Government for 1987-88 in respect of these earlier imports, but the Company's representation for the year under review is still pending before the Government.

With the virtual discontinuance of imports and freezing of imported stocks, the market situation showed some improvement but the continued high availability of indigenous stocks kept the prices depressed. Your Company has, however, been able to maintain profitability at a reasonable level through close monitoring of operations and control of costs. With the improvement in market conditions, the Company is confident of registering higher profits in the current year and the results achieved so far justify this confidence.

> **NAGARJUNA urea which is already a favourite with the farmers in Andhra Pradesh has received good response from Orissa and Madhya Pradesh as well. The product has been distributed through 1,700 village retailers.**

NFCL

The widespread nature of the distribution network will be borne out by the fact that there has been a 40% increase in the activity of the Company's small distributors during the year 1988-89 as compared to the previous year.

Your Company has extended its activity in the handling and distribution of imported DAP which, being a phosphatic fertilizer, is a useful companion for urea. The introduction of "NAGARJUNA" DAP has been well received in the market. This should enable your Company to continue to handle imported DAP even after the Company commences commercial production of urea at Kakinada.

Project Implementation

I would now like to give you a bird's eyeview of the all-important business of project implementation.

At the EGM held recently in April 1989, the members had been apprised of the ambitious target the Management has set for itself for commencement of commercial production by mid-1991, which is 33 months from the 'zero date' against 39 to 42 months which is an accepted norm judging by the experience of well-executed projects of this dimension in the recent past.

Your Management has taken up this challenge in right earnest.

Detailed engineering work is progressing apace along with procurement and construction activities.

Orders for most of the plant and machinery and critical packages have been placed and commitments for an aggregate amount of Rs. 394 crores have already been made. Ordering of the remaining plant and machinery will be completed by the end of 1989. An amount of Rs. 156 crores has already been spent on the Project upto 31st August, 1989.

Contracts for most of the civil construction works have been awarded and construction work at the Project Site is in full swing.

Tenders for mechanical erection have also been floated.

Completion of infrastructural facilities like construction power and water distribution system was reported by me last time. Casting and driving of piles in the Plant area are nearing completion.

The State Government is also taking steps to have the pipeline from Samalkot to the Project Site laid expeditiously to complete arrangements for permanent water supply required for operational purposes.

Adequate steps have already been taken to implement the master plan, developed with the guidance of eminent experts, for the protection of the environment from air, ground and water pollution. Senior officials from the Department of Environment, Government of India, who have recently visited the Project Site have commended your Company's commitment towards the preservation of ecology.

Several of the buildings and structures in the Plant area have come up to the roof level.

Natural Gas

As you are aware, originally the planning of this Project was based on naphtha as the feed stock to be switched over to natural gas when it became available. It is really fortunate that your Company has now been assured of supply of natural gas from nearby Krishna-Godavari basin. The availability of natural gas right from the inception will ensure operational efficiency and troublefree production performance. The contract with ONGC for supply of natural gas is under finalisation.

Fertilizer Pricing Policy

Whilst I am glad to say that the Company has made substantial progress, I may refer to a development which causes me a great deal of concern. The retention pricing formula revised by the Government of India effective 1st April, 1988 will have a very serious adverse impact on the profitability of new fertilizer units. Your Company has already represented to the Government about the imperative need to modify the pricing formula taking into account the requirements of viability of new projects and your Directors are confident that the formula would be suitably modified in the very near future. This is a very basic issue for the survival of the fertilizer industry.

Public Issue

Your Directors are aware of the optimism prevailing in the capital market.

With good monsoons in two successive years and favoureble economic conditions, it is expected that the positive sentiment will continue to prevail and even improve further. Against this background and having regard to the factors specially relating to the fertiliser industry, your Company proposes to enter the capital market nearer April/ May, 1990.

Conclusion

In conclusion, I would like to say that I had the opportunity of visiting together with Shri KVK Raju, Managing Director and Shri Paul Pothen, Technical Advisor, the Project Site yesterday, the 12th September, 1989.

Having thus made an on-the-spot assessment of the latest position of the construction and related activities, my colleagues and I have returned with the confidence that the work on the Project is progressing well and that the Management is taking all steps necessary to achieve the challenging target of commencing commercial production by the middle of 1991.

We feel that with your continued support and understanding, the Company will succeed in this attempt and thus make up a part of the time which was lost earlier due to circumstances which were beyond its control.

Finally, may I say how appreciative I am of the hard and dedicated work being put in by employees at all levels for the speedy implementation of the Project. I would also like to record my sincere thanks to my colleagues on the Board for the cooperation and assistance I have received from them. It is my pleasant duty to thank the Government of India, the Government of Andhra Pradesh, the Financial Institutions, the Banks and Krishak Bharati Cooperative Limited and other promoter shareholders for their valued support and cooperation.

Note: This does not purport to be a record of the proceedings of the Annual General Meeting

Bastar: Development and Democracy

State violence in Bastar has in recent years increased to alarming proportions. The district with the lowest density of population in Madhya Pradesh has the highest density of armed police. The first part of a report by the Madhya Pradesh unit of the People's Union for Civil Liberties. The second part will be published in the following issue.

BACKGROUND

THE popular images of Bastar are rooted in the unique co-existence of a wide range of agrarian technologies that came to prevail from time to time in the history of the region and the country. For instance, in Abhujhmar, a natural division of irregular hills and valleys, people are still engaged in producing *kodo-kutki*. For most of the year they sustain themselves with food gathered in the forests. Just to the north of them lie pockets of Kanker and Narayanpur tahsils where the most modern farming techniques can be seen in operation. In these undulating plains, drained by the river Mahanadi, lies much of the two per cent irrigated area of the district. A part of it also falls under the Dandakaranya Development Authority (DDA). But to the north and east of these pockets you will find people engaged in settled agriculture without the use of ploughs. South of the river Indravati, in the interior of Bijapur, Konta and Dantewada tahsils, people cultivate just one crop in an area drained by two perennial rivers Sabari and Indravati. The community-maintained tanks, once the pride of the region, have gone into disrepair after the state took them over. Yet the tanks and ponds are the only sources of water for the fields (in the district as a whole about 3,500 tanks and ponds cover 82 per cent of the irrigated area). People use the plough here, but it is the wooden and not the iron plough (there are 2,610 wooden ploughs for every iron plough in use in the district).

But then there are not merely different technologies but also different social arrangements, different cultural systems and in fact different communities. To the outsiders the people belong to just one stock, called the scheduled tribes, who constitute 68 per cent of the district's population. But within them, there are a range of communities. In the north are Halbis, to the east are Bhattra and Dhurwa and in the south are Dorlas. All the rest are Gonds, who are the majority. The names given to them by the earlier generations of civil servants and anthropologists stuck to them. And the various Gond groups are now called Raj Gonds (*Koitur Gond*), living mostly in Jagdalpur, Konta and Dantewada tahsils; Bison-horn Marias (*Dandami Maria*) in Bijapur and other parts of the south: Hill Marias (*Mota Kitoo*), an identified primitive tribe in Abhujhmar and Murias in most parts of north Bastar.

If these adivasis have remained as they have it is because there are no options available to them. Each time a new system is imposed or a new technology is unleashed, it has closed the options for another set of people in another area. For instance, during the colonial period, people in Kutru and Bhopalpatnam zamindaries had to abandon their fields due to the zamindari oppression. After independence and zamindari abolition, they returned to find that their fields were now notified as forests, under the newly introduced Forest Act. Development projects in the present period have also restricted their access to the land and forests. In addition these projects have degraded and depleted the forest cover. The practices and customs of these people, which they were initially allowed to continue as 'privileges' and 'concessions' granted by the state, are now treated as 'crimes', to be punished. Having been left with no other option, they 'encroach' upon the forest, bringing it under cultivation with the help of their axes or go hunting in the lean season.

The technological and economic developments also have a cultural and political dimension on the basis of which the administration regulates their lives. Bastar is part of the larger Dandakaranya region. In the colonial period the region was under a range of administrations. Direct colonial rule existed in the central province (Chandrapur) and the agency areas of the Madras presidency (east Godavari and Koraput). Hyderabad, the largest Indian state, governed Adilabad, Karimnagar, Warangal and Khammam, while the Gajpat states of Orissa governed the rest (Kalahandi). Bastar itself was under Bastar (jagdalpur) and Kanker states. Historically, however, the movements of people were never governed by these divisions. In the region as a whole 72 identified dialects are now in vogue.

On to this was imposed the linguistic reorganisation of the states in the fifties, and the region was distributed between Madhya Pradesh, Andhra Pradesh, Orissa, and Maharashtra. But these linguistic divisions have no relevance here. In Bastar, for instance, according to the 1981 census, 60 per cent of the people do not speak any of these four languages: Hindi, Telugu, Marathi, or Oriya! Yet these serve as the basis to understand the current tensions. The most common refrain about the Naxalite movement is that it is alien, an offshoot of the 'Andhra' Naxalite movement. The counter insurgency operations rest on the premise that the Naxalites are a 'gang of dacoits who moved into Bastar from the border beyond', in the words of the district magistrate (DM). But to the adivasis of south Bastar, Kursum Rajakka, the 24 year old Naxalite woman who was killed in an encounter at Mukabelli on March 4 this year is just a fellow Dorla tribal woman, even though she hails from Vajhed mandal (Khammam) which is now part of Andhra Pradesh. Bala Ramanna, killed along with another person, Ramesh, in the forests between Badma and Durgaon, Kaiskal range, Narayanpur on June 7 this year, is a Halbi speaking tribal even though he was not from north Bastar where most of them live, but from Sandra, Konta on the southern border.

The post independence developments also have important implications for adivasi jurisprudence. The adivasis have their own legal system to which some of the offences, although listed in the penal code, were delegated from the colonial period. Presently, the adivasi panchayat has hardly any legal sanction, although local policemen take its help in investigation and prosecution. The distinctive feature of their system is that in it no offence is treated as private in character. All offences are adjudicated by the community and the guilty are identified by the panchayat. Although the Indian penal code came into effect in Bastar almost 70 years ago, its penetration is still incomplete. The adivasis are still attached to their own ethical and penal system.

But these days the activities of the adivasi panchayats get branded as Naxalite activities. For example, in March this year the Bhartiya Janata Party (BJP) tabled a call attention motion in the state assembly on a Naxalite attack in Geedam in which their local leader Tiwari was hit. Our investigation reveals a different story. An adivasi, Sonkuram, from village Marsegaon 10 km from Geedam, was involved in an argument with the wife of Harun Seth, a powerful trader and a local BJP leader, in the weekly Sunday market at Geedam. Seth's son came to the market and beat up Sonkuram. In adivasi tradition if any of them gets beaten up by a non-adiviasi, then the entire village has to be treated to a feast the cost of which is to be borne by the non-adivasi who beat him up. Sonkuram in accordance with the decision of his village panchayat, treated his entire village to the feast. Next sunday, at the weekly market, the adivasi leaders asked Seth to pay. He refused. Vijay Pratap Tiwari, president of the BJP, south Bastar and Joshi, SHO Geedam, intervened on his behalf. Tiwari was reported to have slapped Sonkuram. Enraged, the adivasis beat up both Tiwari and Joshi. The following Sunday hundreds of adivasis, armed with bows, arrows and axes, laid a siege of Geedam. The situation was diffused without

any untoward incident but without any redressal either. The adivasis remained sore about the whole affair. Three months after the incident, when we visited Geedam, a local journalist informed us that ever since this incident neither Tiwari nor Joshi can go into the villages for fear of reprisals. But Joshi was still in charge of the police station in whose jurisdiction he was forbidden to enter. It was this incident that was described by the BJP leader in the state assembly as a 'Naxalite attack', a version duly picked up by the Bhopal-Indore media. The gap between this perception and the actual incident needs no further comment. The gap is not merely a communication gap. Nor is it, in all cases, a wilful distortion. It is located in the very nature of the development process whose interface with the adivasi society has now become the arena of violent social tensions.

Development and Degradation

Bastar contains deciduous forests, consisting of sal, teak and mixed forests. The first attempt to bring its forests under direct state administration was in 1896. Later, in 1908, the Bastar forest manual came into effect. A year later the first commercial exploitation began with a lease given to Beckett and Co, for extraction of 25,000 railway sleepers from sal trees. The second world war increased the scale of operations. After independence when Bastar and Kanker states were merged with the Indian union, the old Forest Act (1927) and the new forest policy (1950) were brought into force in Bastar.

In the period 1956-81, a total of 1,25,483 hectares of forest was transfered to various development projects. Notable among them was the Dandakaranya displaced people's project where initially 7,330 Bengali refugees were allotted 60,000 hectares of forest land. They soon brought 40,000 hectares of this under cultivation. The other major poject was the National Mineral Development Corporation's iron ore mining project at Bailadila. Bastar has about ten per cent of the country's iron ore reserves. Located south of the river Indravati, in Dantewada tahsil, the mines started operating in 1968. They also led to the establishment of the district's first and only railway line from Vishakhapatnam, the port city on the east coast, to the mining township, Kirandul. Twenty-five years ago, when construction work started. Kirandul was one of the two villages from where about 40 Dandami Maria families were displaced. Today Kirandul has just about two per cent tribal population. Almost all of the output from these mines is exported to Japan and it is now India's largest foreign exchange earning unit. Currently the annual production is in the range of five million tonnes.

In addition to iron ore, the area contains a number of other reserves like limestone, dolomite, bauxite, manganese, and tin. Limestone mines, with an average annual production of 1.5 million tonnes, feed the two cement factories on the outskirts of Jagdalpur town. In the early eighties large-scale illegal tin mining was reported in Sukma and Dantewada region of south Bastar. Big traders and mining officials were reportedly involved in buying tin from the tribals, who smelted it and sold it in their weekly markets. Press reports and criticism led the government to initiate measures to stop this. In 1983, about 112 cases involving 141 people, mostly adivasis, were launched under the Mining and Minerals Regulation and Development Act.

In the early seventies an ambitious plan was drawn up to develop industrial forestry in Bastar. Jagdalpur, Barsur and parts of Bijapur tahsil areas, constituting 25 per cent of the district, were identified as the industrial catchment areas. It was in this framework that the famous World Bank financed pine plantation scheme came into existence. Known as the MP Forestry Technical Assistance Project, it led to the establishment of the MP State Forest Development Corporation (MPSFDC). In July 1975, 3,100 hectares of forest in Kurundi, near Jagdalpur, was cleared and replanted with pine. But stiff opposition from various quarters resulted in the termination of the project in 1981. Some of the planted pine was destroyed in a fire, suspected to have been set by some of the adivasis under the leadership of Baba Bihari Das. Much of the remaining pine was attacked by an epidemic of fungus in 1984-85. NMDC took over the office sites and quarters of the pine plantation project and prepared a plan for dolomite mining in a different forest area (about 2,450 hectares). But again it was dropped due to resistance. Independently a larger scheme of establshing a series of eight or nine hydel projects on Indravati was proposed. The total submergence area of the scheme is around 31,000 hectares and the total power generating capacity is around 1,500 MW. Starting from Ichampalli, Gadchiroli, these projects were opposed by a wide range of forces. For the present they are not under active consideration by the gvernment, except for the one at Bodhghat, which is under way.

The first survey of the project was undertaken in 1962. The foundation stone was laid seventeen years later in 1979. Initial clearing, construction of the office site, the quarters and an impressive bridge on the river Indravati, near Barasur, was undertaken in 1984. Throughout the two decades when it was under consideration no one really bothered to inform, let alone involve the people whose villages are to be submerged in the project. In recent years organised resistance has begun. The villagers, mostly Marias, do not want to leave the area. The manner in which they have been treated has generated complete mistrust of all institutions among them. They even made an abortive bid to manhandle their MP, Mankuram Sodhi (*'mushkil se ek bar aaya tha, prashasan ko leke'*). Faced with their resistance, the government is coming out with more and more attractive promises of rehabilitation. The scheme was made in accordance with the MP Rehabilitation Act, 1985 and modelled along the lines of a similar scheme of the other controversial project of the state, the Narmada Sagar Project. It has a nineteen point programme which promises, among other things, land, houses, and jobs in MPEB. The compensation, which was only Rs 1,000 per acre in the six hundred acres already cleared at Barsur, is now raised to Rs 4,000. A model rehabilitation village at Bodhli (Kundri), about 45 km from their place, was built to convince them. But they remain unconvinced. Their agitation is supported by Jai Kishore Sharma, a dissident secretary of DCC(I), and also environmentalist pressure groups based in Jadalpur, Bhopal and Delhi. The Naxalites have also announced their formal opposition. But all major political parties, including Congress(I), BJP, and CPI are involved in an agitation in favour of the project. The people allege that officials of MPEB, in connivance with the thekedars, have bought all the leading political parties. In fact, Sharma told us that he himself was offered Rs 2 crore by the chief engineer, on behalf of the contractors! For the present, due to pressure, the government has suspended work on the project. But the prospects still remain grim. When asked what would happen, the president of the Bodhghat Sangharsh Samiti replied, *'vo goli chalayenge, ham teer chalayenge* (They will fire bullets, we will reply with arrows).

The social tensions being generated by the displacement of people in the project areas is only part of the story. The environmental degradation affects people in far-flung areas also. The ore fines from Bailadila, for instance, have been dumped into Sankhini river every day for the last twenty years. The river joins Dankhini at Dantewada and from there flows further south. Now the mass of red slime is spreading through the southern river system. Some 40,000 people living in about 51 villages are, its immediate victims, deprived of even drinking water.

More than the development projects, the major source of degradation of forests is commercial forestry. Timber feeds 40 odd small scale saw mills and 62 wood-based factories in the district. But more of it serves the national market. Bamboo, among other things, feeds the paper factories in Andhra. Much of the felling is illegal. One of the ingenious methods adopted by the timber traders in Bastar was through the Malik Makbuja system. A precursor of the present day social forestry programmes, in this system, the tribals were given ownership rights over identified and specified trees. They alone had the right to fell or sell their trees, after taking due consent from the concerned forest officer. They were also protected by the MP Protection of Aboriginals (Interest of Trees) Act, 1959. The traders, in

collusion with the officials, got the relevant papers signed thumb impressed by the tribals and felled a large number of trees. The government finally abolished the system in late 1975. In another instance the entire Sitram forest (Bandey range, Kanker circle) was reported to have been lost in fire in April 1980. But the fire was not brought to the notice of the DFO until fourteen months later, in June 1981. The government has ordered an enquiry whose report is yet to see the light of the day. It is believed that the entire forest was cleared through illegal felling.

To compensate for the depletion of the forests the government began encouraging plantations. Thus, centuries old sal trees and mixed forests came to be replaced with Eucalyptus (10,000 hectares in the fourth plan period alone), Caribbean pine (on an experimental basis in 1968-69), pines (3,100 hectares under the World Bank project) teak (over 1,25,000 hectares per year in recent period), and others. The replacement of rich, mixed forests by mono-cultural plantations had disastrous implications both for the environment and the people. The forces generated by the large-scale commerical forestry and plantations control the politics and even a section of the administration in Bastar.

From about the time of the Sixth Plan onwards, the government initiated a variety of social forestry programmes in Bastar. Some of them are funded by the Swedish International Development Authority (SIDA). Presently they include three schemes; bund forestry, farm forestry, and agro-forestry.

From the early eighties, four environmental and wild life projects came into existence. They include Kanger Valley National Park (200 sq km), Bairamgarh Game Sanctuary (139 sq km), Pamed Game Sanctuary (262 sq km) and the Indravati Abhyaranya Tiger project (3,000 sq km), the biggest among them. It is located near Kutru, Bijapur tahsil. There are 57 villages with a population of 6,000 inside the reserve. The density of population is very low, with about 9 persons per sq km, and the villages are scattered both in the core and buffer zones of the reserve. These villages are proposed to be evacuated and a Rs 1 crore rehabilitation programme has been prepared by the directorate of Project Tiger, subject to the approval of the government. But in the meantime, the reserve is becoming famous for other reasons. Naxalite activity in the former zamindari areas of Kutru and Bhopalpatnam has attracted a lot of attention. In one of the villages inside the reserve, Mukabelli, a Naxalite woman was killed in an encounter, leading to massive armed police raids on many of these villages. In the last three years at one time or another armed police camps were set up in as many as eight of these 56 villages. In Bedre and Pileru camps are stationed more or less permanently. The activities of armed police are now adding a new dimension to the problems of the environment in Bastar.

(To be concluded)

REVIEW OF AGRICULTURE

Canal Irrigation and Agrarian Transformation

The Case of Kesala

Pieter Gorter

The process of agrarian change in Kesala, a village in Valsad district in south Gujarat, indicates a strong trend towards capitalist farming. This trend is, however, mainly limited to the larger landholders. In the early 1960s, agriculture was already commercialised and wage labour was used on a permanent basis, especially by Patidars and Anavils. These castes had been the peasant vanguard in the process of commercialisation during the 19th and early 20th century. The construction of a large-scale canal irrigation system in south Gujarat has offered these farmers the means to transform from commercial farmers into full-fledged rural capitalist entrepreneurs.

Introduction

THE character and pace of the transformation of Indian agriculture after independence has been the subject of research and debate since the 1960s. Authors such as Daniel Thorner, Utsa Patnaik and Ashok Rudra have emphasised in particular the capitalist tendencies in Indian agriculture, by pointing to the process of increasing commercialisation, the growing reliance on hired labour and the rising rate of capital intensification. Others, like Amit Bhaduri and Pradhan Prasad, have stressed the persistence of feudal structures, such as tenancy relations, usury, bonded labour, which inhibit the emergence of rural capitalism. In this article I will sketch the process of agricultural transformation in a single village in south Gujarat: Kesala[1] in Valsad district. I stayed in this village for four months in 1986 to study the impact of canal irrigation and, more in particular, the factors which affect the distribution of canal water. I do not intend to give a full account of my findings in this article. Here I want to compare my village data with those of another Dutch researcher: Enno Hommes. He conducted research work in the same village. Only this was in 1964. Although his research topic was different from mine,[2] a comparison is nevertheless possible and worthwhile. In the early 1960s canal irrigation was still a new phenomenon in south Gujarat and the full impact of the so-called 'green revolution' had yet to come. By putting Hommes' data next to mine I hope to describe and analyse the process of rural transformation in this village for a period of more than twenty years. In the comparison I will give special attention to the evolution of the cropping pattern and the changes in land use, mechanisation, marketing arrangements, labour relations, landholding and tenancy. A closer look at these aspects will enable us to determine whether this village economy has indeed developed along capitalist lines and to what extent pre-capitalist relations persist.

Some aspects of village life had to be left out of this discussion, because Hommes' data are not entirely compatible with mine. In spite of this drawback I felt that the opportunity to present the major changes in a west Indian village over a period of two decades should not be missed.

Before we turn our attention to the comparison it is necessary to review briefly the major developments in the agriculture of south Gujarat during the colonial era. It would be wrong to assume that the changes in post-independence agriculture constitute a break with past developments. The processes of transformation in the 19th and early 20th century have to be included in the analysis.

Historical Context

Until the early 19th century, agriculture in south Gujarat was still largely subsistence oriented. A number of factors emanating from the imposition of British colonial rule were to trigger an irreversible process of commercialisation. One of the most important factors has no doubt been the introduction of a new legal framework for the assessment and collection of revenue, the *ryotvari* system. Contrary to the traditional tax-farming system, taxes were assessed and collected on the basis of individual holdings in the new system. The farmers were now considered the legal owners of the land they cultivated, whereas before only the state could own land. As a result land became a commodity which could be sold, bought and mortgaged.

A second important characteristic of the new system of revenue collection was the compulsion to pay the taxes in cash, thus forcing the cultivators to market at least part of their produce. The ensuing need to grow cash-crops coincided with an increasing demand for raw cotton from the Manchester textile mills. Cotton had been cultivated in south Gujarat for centuries, but it was not until the second half of the 19th century that it became a predominant part of the cropping pattern. By the end of the 18th century the Indian cotton growers could not meet the modest demand for 5,00,000 pounds of cotton from the British textile manufacturers. By the year 1825, the total quantity exported had already increased to 60 million pounds, while in 1871 more than 400 million pounds of cotton were exported from India to Britain [Choksey 1968: 128 and 140]. The importance of cotton for south Gujarat is reflected in the fact that at the beginnng of the 20th century approximately half of the cultivated areas of Bharuch, Surat and Valsad districts were cropped with cotton [Choksey 1968: 140 and Charlesworth 1979: 127].

Besides cotton, an increasing proportion of the food production was marketed. The specialisation in large parts of south Gujarat on the cultivation of cotton implied that food crops had to be imported from other, food producing areas [Chua 1986: 2094].

The transformation of agriculture from subsistence oriented towards market oriented did not only affect the choice of crops. Labour relations changed as well. Wages in cash were more and more preferred over wages in kind and the patron-client ties between the larger landholders and their bonded labourers (*Halis*) started acquiring more business-like and detached dimensions [Breman 1974]. A further indication of the changing character of agriculture is the increasing capital intensity. After wasteland had been brought under cultivation, the section of landholders which had benefited most from the cotton boom tried to further increase production by raising the productivity of their land. They therefore began investing profits in irrigation facilities, the reclamation of *khar* land (i e, saline land) and the improvement of crops [Chua 1986: 2098].

Not all peasants in south Gujarat were, of course, involved in this process of commercialisation to the same extent, nor did all of them benefit from it. The castes who both contributed and benefited most were the old elite of Anavil Brahmans and the new and rising elite of Kanbi Patels. In the long run the Kanbis have probably been more involved in the process of agricultural transformation than the Anavils. Many Anavil Brahmans turned away from agriculture to pursue careers in the government bureaucracy and the banking business, because their high caste ideology values non-manual, urban white-collar jobs more than agricultural enterprise [Van der Veen 1972].

The Kanbis, on the other hand, have always been more oriented towards agriculture. In early colonial reports, the British already described them as being excellent and thrifty farmers [Breman 1984: 108]. Although they were initially only small farmers, many managed to expand their holdings by either renting land from absen-

tee landowners (often Bania and Parsi moneylenders) or buying land from indebted tribal peasants or Anavils who had moved to the cities. Paradoxically, even the great famine of 1899/1900 proved beneficial to many Kanbis in this respect, as a large number of small Koli and tribal peasants had to mortgage or sell their land in order to avoid starvation. In the decades following the famine, this land would eventually come under the control of the dominant caste of Kanbi Patels [op cit, 109].

In the 1920s and 1930s the Kanbis succeeded in further consolidating their economic position by establishing co-operative cotton marketing societies and ginning factories. In fact, the Kanbis of Surat district were among the first in India who established these kind of cotton co-operatives [op cit, 111]. Profits were then no longer siphoned off by middle-men and private cotton gins, but could be re-invested in the production and marketing processes.

The improvement of their economic position was accompanied by a claim for higher social and political status. They adopted the new caste name Patidar, which originally belongs to a sub-caste in Kheda district who witnessed economic and social progress long before the Kanbis of south Gujarat did. In 1908 the Patidar Yuvak Mandal was founded. This emancipatory movement stressed the importance of education and the value of high caste moral standards. The final part of this process of sanskritisation consisted of the Kanbi's active participation in the struggle for independence. This struggle gave them the opportunity to translate their recently acquired economic and social dominance into political influence. The decision to construct a canal irrigation system in south Gujarat may very well have been related to the Kanbi participation in the natioinalist movement.

We may conclude from the foregoing that during the colonial period agriculture in south Gujarat became increasingly commercial and to a limited extent even capitalist. According to Utsa Patnaik rural capitalism is characterised by the following three features:

a) the marketing of a large share of the agricultural produce;
b) the permanent use of wage labour;
c) the accumulation and re-investment of surplus value in order to generate more surplus [1971: A-126].

The accumulation and re-investment of surplus value distinguishes capitalist farming from merely commercial farming. We have seen that in south Gujarat a small section of the farmers did in fact re-invest profits in order to raise the productivity of their land. This may not have been a general trend, but obvious enough to justify the conclusion that the seeds of rural capitalism were sown long before independence and the introduction of canal irrigation.

The construction of a canal irrigation system has nevertheless been of great importance for the agricultural development after independence; not in the sense that it triggered a process of commercial farming, for as we have seen, this process was already well under way long before the system was even planned. The productivity of land was, however, still limited by the uneven and unreliable supply of rainfall. Improved and extended irrigation facilities were to change this situation radically.

The first plans for the construction of a dam in the Tapi river date from the end of the 19th century. The main motive then was to control the floods which regularly ravaged the Surat district. It was not until independence before these plans took on a more definite shape. India had lost considerable parts of its food producing areas to Pakistan and new irrigation systems were planned and constructed all over the country to remedy this setback. The primary reason for the construction of a canal system in south Gujarat was, therefore, the need to increase both the yields of and area under food crops. With respect to this objective it is important to note that south Gujarat is assured of a fairly high average amount of rainfall.[3] It is therefore questionable whether canal irrigation was really necessary to boost the cultivation of crops such as pulses and *jowar*, which do not require a large supply of water, and paddy which is a monsoon crop. The decision to construct a canal system in south Gujarat may have been more the outcome of political lobbying than the result of agronomical considerations. Vallabhbhai 'Sardar' Patel, India's first minister of home affairs, had been the leader of the famous Bardoli *satyagraha* of 1928 in which the Surat Kanbis played a major part. It is not too far-fetched to assume that Patel had some part in securing the system for the Surat Kanbis, who constituted an important section of his political following [Mankodi and Gangopadhyay 1983: 28-29]. These are just speculations, however. The fact remains that canal irrigation has not resulted in an increase of the area under food crops. I will come back to this issue later in this article.

The Ukai-Kakrapar system of south Gujarat was constructed in two stages. In the late 1950s a pick-up weir was built near Kakrapar, a village in Surat district, and two main canals were excavated. There was no reservoir yet and canal water was, therefore, only during and shortly after the monsoon available. The second and by far most expensive stage comprised the construction of a 4,927 metres long dam near Ukai and two additional main canals. After the completion of the Ukai dam in 1971 a reservoir of more than 60,000 hectares had been created [op cit, 27]. Only then perennial irrigation became possible, which would induce a growing number of farmers to use this new agricultural input. After these introductory remarks it is high time to direct our attention to the development of agriculture in the village of Kesala.

Kesala: A General Description

Kesala lies in the Navsari *taluka* of Valsad district. It is situated in the vicinity of two urban centres: Navsari at some five kilometres to the south and Surat at about twenty-five kilometres to the north. Both cities can be reached easily by either road or railway. In Maroli Bazar, a small town nearby, a railway station is located. Public buses and a small fleet of autorickshaws await the passangers coming from Surat and Navsari to take them to nearby villages and townships. It may prove difficult, however, to persuade one of the rickshaw drivers to take you to Kesala. Although only a few kilometres long, the road is in such a bad condition that the drive is an ordeal for both passenger and rickshaw.

The narrow road winds through the fields to the centre of the village. Here, the *falias* of three of Kesala's five major castes are concentrated: Anavil Brahmans, Patidars and Koli Patels. The quarters of the other two, Ahir and Halpati, are situated at a few hundred metres from the village centre, alongside the road to Navsari. Apart from these castes, a small number of Harijan households live in Chhinam, one Hajaam (barber) and one Modi family, and the Brahman priest.

The Anavils, Patidars, Kolis and Ahirs constitute the landowning section of the population. (The Harijans also own some land, but the area is negligibly low.) In the previous section I have already discussed the dominance of Anavils and Patidars in the region. Later we will see that Kesala is no exception. The Kolis and Ahirs belong to the middle castes. Kolis are now the largest landowning caste in the central plain, but originally they were tenants and even agricultural labourers. Over the past three decades they have benefited from the abolition of tenancy in the 1950s and the expansion of industrial employment. Most Kolis belong nowadays to the section of small farmers, while some have been able to reach the ranks of middle farmers. The Ahirs were originally shepherds, but after independence many have taken up agriculture and with relative success. They too belong to the category of small farmers.

The Halpatis (also known as Dublas) are the largest caste of Kesala. They are of tribal origin, but have integrated into the Hindu caste system. Traditionally they are employed as agricultural labourers on the farms of Anavils and Patidars. The name Halpati is derived from the term *Halipratha*, which refers to their traditional labour relation with especially the Anavil Brahmans. *Halipratha* was a system of bonded labour in which the labourer, the *hali*, was tied to the farmer by means of indebtedness. The relationship between the *hali* and his master was characterised by servitude, and also by patronage. The farmer was morally obligated to provide his servants and their families with food, clothes and shelter even when no work could be

done or the *hali* was ill or too old to work. According to Breman this labour regime has virtually disappeared due to the process of increasing commercialisation in the 20th century [1984: 298].

The Kesala Harijans are quite independent of the village economy, because most of them work in the city, in particular Bombay.

KESALA IN 1964

In 1964 there were no autorickshaws in Maroli, nor did the public transport pass Kesala. The villagers either walked from Maroli to Kesala or they used one of the horse-drawn coaches owned by Maroli Muslims. In those days the village was not electrified and the women still fetched the drinking water from one of the open wells. The houses of Anavils and Patidars were among the best in the village. The Halpatis, on the other hand, had to live under the worst of circumstances: small mud huts with thatched roofs, which hardly protected them from cold and rain. The condition of the quarters of Kolis, Ahirs and Harijans varied more. Some of them owned houses which could stand the comparison with the best of Anavil houses, while others had to do with little more than huts.

In 1964, 1,423 people lived in Kesala. Table 1 gives a castewise breakdown of this number. Over one-third of the population belonged to Kesala's largest caste, the Halpatis. The Kolis were the largest landowning caste. The Anavils and Patidars were a small minority, but the next section will demonstrate that their numerical weakness did in no way affect their social and economic dominance. Let us look therefore now at the agricultural situation in the early 1960s.

AGRICULTURE AND DISTRIBUTION OF LANDHOLDING

Any discussion about agricultural practice in an Indian village should begin with the analysis of the distribution of landholding among the various castes and between the individual households dependent on agriculture. Often this is a complicated endeavour which should be dealt with cautiously. It is not always possible to have complete certainty about the control of specific plots of land, due to the complexities of joint family ownership and rules of inheritance. Kesala is of course no exception in this respect and the figures presented here and in the following sections should therefore not be treated as absolute and final statements, but rather as indicators of trends and patterns of control over land.

In 1964 the large majority of the Kesala farmers were small landowners. There were no forms of tenancy and even before the land reform in the late 1950s, tenancy had been very limited. Enno Hommes registered distribution of land in 1964 as given in Table 2.

The dominant position of Anavils and Patidars is obvious: taken together they controlled more than 60 per cent of the available land, while they constituted only 25 per cent of the total number of farming households. From these figures we could conclude that the gap between Anavils and Patidars on the one hand and Koli, Ahir and Harijan on the other was very wide. There was however more differentiation of landholding within castes than these aggregate statistics suggest. To get a more accurate impression we should have a look at the sizes of individual holdings as well. In Table 3 the sizes of individual operational holdings is considered for each caste separately. The general pattern still reflects the dominance of Anavils and Patidars, but we can also see that some of the cultivators belonging to these castes were only small or even marginal farmers. The statistics on Koli landholding show, on the other hand, that a fair number belonged to the categories of middle and even large farmers (more than 10 acres). In fact, more Kolis owned large landholdings than the Patidars. This should of course not obscure the fact that the large majority of Kolis were small or marginal farmers.

According to Hommes' data no tenancy relations existed between the farmers of Kesala in 1964. This is very well possible, since land reform had been implemented only seven years before. On the first of April 1957, a day remembered as Tiller's Day in Gujarat, rented land was officially transferred from the owners to the cultivators. In Kesala only 105 acres or 12 per cent of the cultivable land had been rented and therefore transferred. Land reform did not alter the general pattern of landholding in the village. This was not only because of the relatively small area, but also because the original tenants were mostly marginal Koli farmers. The implementation of the land reform did not meet with any opposition either, because the owners were not resident in Kesala. In my discussion of landholding in 1986 we will see that tenancy has reappeared, although the form is quite different nowadays.

From the information presented so far we can conclude that the majority of the Kesala cultivators belonged to the category of small and marginal farmers: 72 out of 119 farming households owned five acres or less. Most of these farmers were engaged in other economic activities to supplement their incomes from agriculture. As far as the Harijans are concerned, we can say that agriculture was of hardly any importance. Employment in Bombay was their main source of income. Most of the marginal Koli farmers had found work in the textile mills of Surat and Navsari. Due to the relatively high level of education among the members of this caste, they were able to apply for skilled and reasonably well paid jobs. Some even managed to earn more in industry, than most Anavils and Patidars were earning in agriculture. Hommes suggests that the economic progress of these Kolis was accompanied by a rising social position in the village. There was, however, no indication that the well-to-do Kolis had started to invest their wages in their farms.

Kolis were not the only caste engaged in urban employment. The same applied to many Anavils, although their motives for pursuing urban careers were quite different. In a previous section I already mentioned the preference of this caste for non-agricultural, white-collar jobs. In Kesala this preference had resulted in a steady decline of Anavils involved in agriculture. Between 1951 and 1964 the total number of Anavils living in Kesala had actually gone down from 204 to 155. Hommes expected that this decline might in the long run seriously undermine the dominant position of this caste in the village. In the section on 1986 we will see whether the trend to turn away from agriculture persists and how this has affected the position of Anavil Brahmans.

The Patidars and Ahirs were less involved in work outside agriculture. Some Patidars worked in the new and booming diamond cutting industry, but overall they were largely

oriented towards agriculture. Most Ahirs were still shepherds, although gradually they began to take interest in the cultivation on land.

Land Use and Cropping Pattern

In the early 1960s agriculture in Kesala, and for that matter in the whole region, consisted of a combination of dry and rainfed farming. Only a very small proportion of the fields was irrigated. I will elaborate on this issue later. Out of the total of 830 acres of cultivable land 116 acres had been turned into *kyaris* for the cultivation of paddy. On the remaining land dry crops such as *jowar* and cotton were cultivated. The average cropping pattern of a middle-sized farmer consisted of a few acres under paddy and *jowar* for domestic use, while the rest was cropped with cotton. It is important to note here that all farmers, large and small landholders, cultivated the same crops. Only the size of the area under the cash crop cotton differed. In 1986 this uniformity had disappeared. In Table 4 the cropping pattern for the entire village is shown. The main crops grown were cotton, *jowar*, paddy and pulses. We can see that the area under irrigated crops, such as sugarcane, banana and vegetables was still negligibly low. In 1964 the Kakrapar canals had been operational for a few years, but the impact of canal irrigation was nevertheless minor. No more than 8 per cent of Kesala's cultivable area was irrigated by means of canal water. In the command area of the system as a whole the same situation prevailed: paddy and cotton accounted for 20 per cent of the command area each, while 30 per cent was cropped with *jowar*. The important question is of course why farmers were not using more canal water, but decided to stick to the traditional crops. Hommes tried to explain the reluctant attitude by making a distinction between progressive and conservative farmers. Those who used fertilisers, introduced new crops, used more wage labour and, more in general, attuned farm management more to market demands were labelled progressive. Conservative were those farmers who clung more to traditional practices. Hommes recognised that this distinction could only be applied to middle and large landholders. Cultivators with less than ten acres were either not able to invest in new technology or not interested, because their main source of income was not agriculture but urban employment. The prevailing conservative attitude was, according to Hommes, the main reason for the limited use of canal irrigation [1970: 120].

It is very doubtful whether the dichotomy of conservative and progressive farmers will lead to the right explanation. We have seen that agriculture in south Gujarat as a whole is caught up in a process of commercialisation which started at least 150 years ago. There is no reason to assume that Kesala is an exception in this respect.

More to the point as far as the use of canal irrigation in Kesala in 1964 is concerned were the technical problems the farmers faced, such as insufficient land levelling and the lack of field channels. The most important constraint was surely the fact that canal water was only available during and shortly after the monsoon. The Ukai dam had not been constructed yet and water could not be stored for use in the dry season. Consequently, canal irrigation could only be used to supplement monsoon rainfall. This situation was obviously no incentive for farmers to start growing crops which require a regular supply of water perennially, such as banana and sugarcane. The decision not to rely on canal water was, therefore, not the result of conservatism but, on the contrary, a rational and calculated response to the inadequate supply of water. This explanation is more plausible, both in the light of the history of agricultural developments in the region and in view of the changes I witnesed in 1986.

Marketing of Agricultural Produce

We have seen that cotton was the main market crop in Kesala. In my brief discussion of the history of south Gujarat's agriculture I have pointed out that the Surat Patidars (Kanbis) established co-operative cotton gins in the 1920s and 1930s. The farmers in the Maroli area followed this example in the 1950s. The first co-operative ginning factory in Maroli Bazar was founded only in 1956. In 1964 some fifty villages were connected with a total of 2562 members. In Kesala too, nearly all cotton growers were members. Apart from processing and marketing cotton, the co-operative supplied its members with credit. In those days cotton was the only crop marketed in this fashion. Vegetables were becoming increasingly important as a market crop, but were still sold through middlemen in Navsari. Paddy, *jowar* and pusles (*val*) were grown primarily for household consumption. Surpluses were either sold to other Kesala households or marketed in Maroli.

Labour Relations

In 1964 only the Anavil and Patidar farmers employed agricultural labourers on a permanent basis. Some Kolis used wage labour during the peak periods of the agricultural cycle, but in general they cultivated their fields with family labour. Some occasionally even worked as agricultural labourers for Patidars and Anavils. Most of the agricultural labour was, however, recruited from the Halpati caste. Out of the 111 Halpati men living in Kesala, only ten worked outside the village permanently. 55 worked both in Kesala and other villages, while 46 were employed by the Kesala farmers the whole year through.

Hommes concluded that the Halpatis had benefited from the ongoing process of commercialisation. Due to the expansion of the areas under paddy, cotton and pulses in the 1950s the demand for agricultural labour had doubled. The Halpati population gr in the same period by some 50 per cent o ly. The process of commercialisation also a fected the character of the labour relation According to Hommes, the relationship be ween Patidars and Anavils on the one har and their permanently employed laboure on the other, no longer resembled the trad tional *Halipratha* labour regime. Althoug some moral obligations still existed, th labourers were in no way bonded to the employers. The Halpatis were legally free t leave their former masters and some in fa did. More important than the new leg rights of the Halpatis was the increasingl commercial outlook of the larger farmer They realised that often it was more pro fitable to employ labour on a seasonal o even daily basis than on a permanent on

The Halpati women only worked in th fields when the crops had to be eithe planted or harvested. The rest of the yea they were employed as maids in th households of Patidars and Anavils.

Summary

Before we turn our attention to the situa tion in 1986, some general conclusions abou agriculture in Kesala in the early 1960s ar in order. The large majority of the farmer were small landowners, who had to make do with less than five acres. Most of these smal and marginal farmers belonged to the middle castes of Koli and Ahir. For the former urban employment became increasingly important, while the latter still depended largely on their livestock. Agriculture was dominated by the upper castes of Patidar and Anavil Brahman. Although a minority, they controlled most of the arable land in the village.

In general, agriculture in Kesala in the early 1960s can be described as commercial. Especially the middle and large farmers were able to grow cotton on a large proportion of their land and could employ local labour on a permanent or semi-permanent basis. These farmers started to experiment on a small scale with the cultivation of new and more profitable crops, such as vegetables and sugarcane, the use of chemical fertilisers and irrigation. The level on which profits were reinvested in agricultural enterprise was, however, limited, by the inadequate supply of canal water. The farmers' choice of crops was still determined by their dependence on

Anavils toward agriculture may have been of some importance too. The number of Anavils who depended on agriculture for their livelihood had steadily declined. It remains to be seen whether this retreat has affected their dominant position in the village.

KESALA IN 1986

According to the 1981 Census, 1728 people distributed over 305 households inhabited Kesala. It follows that the village population had increased by 21 per cent since 1964, which is relatively low when we take into consideration that in Valsad district the rural population increased by more than 18 per cent in the period between 1971 and 1981. The lower growth rate in Kesala may be explained by the fact that some Koli and Patidar households have migrated to the United Kingdom and the United States, while some Anavils left the village to live and work in the city. By contrast, the Halpati population of Kesala increased by 42.5 per cent from 472 to 673.

In 1986 the quality of life had improved for many. The village has been electrified and all castes, except the Halpatis, are able to afford the use of electricity nowadays. The Patidars and Anavils even installed streetlights in their *falia*. Most of the villagers no longer fetch their drinking water from one of the open wells. In the early 1970s a drinking water tank was constructed and now most women fetch water from taps in front of their houses. The tank was financed by the so-called Africa-*wallahs*: people who migrated to East Africa in the 1940s and 1950s. The ones who were successful contributed not only to the welfare of family members who stayed behind, but also sponsored village level projects, such as the water tank and a new primary school.

The general impression of the village centre is one of prosperity. The majority of houses is made of bricks with tiled roofs. Motor cycles, bicycles, radios and even (colour) television sets are a common sight. Most of these luxury goods are found in the Anavil and Patidar *falias*, but not only there. A number of Kolis and Ahirs seem to have done very well too. The only caste which does not appear to have benefited from recent developments are the Halpatis. Quite a few still live in huts scattered over the village grounds. Most of them, however, live in a government sponsored housing project on the outskirts of the village. Two long rows of small quarters were built here for the benefit of the Kesala Halpatis. These houses are unfortunately already in a bad state, due to the use of inferior material and clumsy construction work. I will elaborate on the difficult position of the Halpatis later in this article.

AGRICULTURE IN CONTEMPORARY KESALA

Let us start our discussion of contemporary agriculture in Kesala once more with an analysis of the landholding statistics. The figures presented in Table 5 tell us first of all that the Anavil Brahmans and Patidars have not lost their dominant position as far as landholding is concerned. The distribution of land between these castes has changed somewhat. The total landholding of the Anavil farmers decreased from 327 acres in 1964 to 280 acres in 1986, while the Patidars have been able to expand their landholding by 37 acres in the same period. The decrease of Anavil landholding is caused by the persisting trend to turn away from agriculture and pursue urban careers: the number of farming Anavil households went down from 21 to 17. Thanks to the smaller number of farmers, the average landholding could increase eventhough the total Anavil landholding declined.

The Ahirs have done fairly well over the past two decades. They managed to increase their total landholding by some 150 per cent. This no doubt impressive figure should not obscure the fact that the average landholding is still no more than 4.2 acres.

The Kolis seem to have fared least well. They lost about 50 acres between 1964 and 1986, while the total number of farming households went up from 49 to 55.

Let us now consider once more the size of individual holdings per caste. The majority of Anavil and Patidar farmers still fall in the categories of middle and large farmers. The development among the Koli farmers is more ambiguous. Some have been able to reach the ranks of large farmers (more than 15 acres) while others have lost land. The majority of the Kolis still belong to the category of marginal farmers. The same basically applies to the Ahirs.

In addition to the information presented in these tables, I should mention a few farmers with extraordinary large holdings. One Anavil, who is also the *sarpanch* of the village, cultivates about 100 acres and one Patidar household controls some 80 acres. Taken together, these two control more than 20 per cent of the arable land of Kesala. This type of landlords is a new phenomenon in the village. Hommes did not come across anything like this in the early 1960s. In those days the largest farmer owned no more than 38 acres. The fact that these two farmers have acquired extra land to the extent mentioned is an indication of the increasing value attached to land. This is no doubt related to the changes in the cropping pattern and land use, which we will discuss later. Due to the rising productivity of land and the increasingly capitalist outlook, the larger farmers try to obtain more land by all possible means. This brings me to the issue of tenancy relations. Contrary to 1964, tenancy is of considerable importance in Kesala today. The modern type of tenancy relations are, however, radically different from the traditional type: nowadays the large farmers rent land from smaller ones to expand their landholding. Due to the restrictions laid down in the Land Ceiling Act, the larger landowners are not able to buy more land. The only way to control larger areas of cultivable land is, therefore, to rent it. In this situation there are basically two categories of farmers who may decide to rent their land out. The first one consists of those whose landholding is too small to be economically viable and who may be indebted to larger farmers. The second category consists of Anavils who aspire after urban careers or households which lack sufficient manpower to cultivate the fields or supervise the cultivation. The latter category usually rent their land out to fellow caste members or family. They are often reluctant to sell, even if this were possible, because the land has been family possession for many generations and represents sentimental value or enhances their social status. In Table 7 the land rented per caste in Kesala is shown.

The large proportion of land is rented out to fellow caste members (66 out of 105.5 acres) and we may therefore assume that in Kesala land is rented out largely by farmers of the second category. The renting farmers belong without exception to the sections of middle and large landholders. The largest Anavil farmer, for example, has rented about 40 acres, which is 40 per cent of his total landholding. He rented this land primarily from other Anavils so we may conclude that the trend among the members of this caste to turn away from agriculture has actually favoured this particular farmer. The largest Patidar farmer is responsible for 33 out of a total of 44.5 acres rented by this caste. In the next section it will become clear why these farmers are so eager to control extra land. For now it will suffice to conclude that tenancy has re-appeared in Kesala, although nowadays not the small Koli farmers are the tenants but, on the contrary, the large Anavil

TABLE 5: OPERATIONAL HOLDING PER CASTE IN 1986

(Area in acres)

Caste	No of Farmers	Total Holding	Average Holding
Anavil	17	280.6	16.5
Patidar	11	199.0	18.0
Koli	55	222.3	4.0
Ahir	25	107.4	4.2
Harijan	15	15.7	1.0
Total	123	845.0	6.9

and Patidar farmers. The rent is a fixed amount of money which is paid annually. I did not encounter any traditional crop-sharing arrangements in which the lessor receives a share of the agricultural produce.

It is of course not surprising that the two largest farmers of Kesala dominate not only economic village life but also village politics. The Anavil Brahman is not only *sarpanch*, but also the chairman of the Maroli sugar factory and member of the governing boards of several federations of co-operative societies and, finally, he is an active Janata party man. The Patidar farmer is chairman of the village multi-purpose co-operative society of Kesala.

From all this we can conclude that the dominance of Patidars and Anavil has not decreased over the past two decades, although land and economic power have been concentrated in fewer hands.

The trend to seek urban employment has not only persisted among Anavils, but also among the Kolis. In every Koli household at least one person is employed in the textile mills or the government services. Contrary to the expectation of Hommes, the Kolis have not used their wages to boost their agricultural position by purchasing extra land or more sophisticated agricultural implements. The money is mostly used to improve houses and to buy luxury goods. The wages are furthermore used to hire more Halpatis to cultivate the fields, thereby substituting family labour with wage labour. In the early 1960s the Kolis still worked in the fields themselves and some even worked as agricultural labourer for Anavils and Patidars. The increasing reliance on wage labour should, however, not be interpreted as a sign of rural capitalism. The use of family labour and, more specifically, the cultivation of the fields by women, is considered a sign of low social status. The extra income derived from urban employment gives the Kolis the opportunity to imitate the lifestyle of the higher castes by freeing the family from annual agricultural work.

Unlike the Kolis, the Ahirs have no ambition (yet) to follow the example of the higher castes. They still cultivate their fields themselves and use wage labour only during the peak periods of the agricultural cycle. By 1986 the Ahirs had switched completely to agriculture. The flocks of sheep observed by Hommes have disappeared and the Ahirs I intrview confirmed that nowadays they are fully dependent on agriculture for their livelihood. The number of Ahirs who work in industry is very small. Those who do invest their wages in extra land, better implements and, if possible, a tube-well. A striking example of an Ahir household which uses this strategy to raise the income from agriculture, is composed of four brothers who live and work together with their wives and children. All brothers are working in the Navsari textile mills and they invest their wages in the farm. In 1986 this household owned 35 acres of which 30 were bought over the past twenty years. One of these brothers is considered to be the leader of the Ahir community. He has a university degree and has been chairman of the village co-operative for a number of years. When asked why he was no longer chairman he claimed that "lack of time" prevented him from being a candidate for the post again. It is also possible that the Patidars preferred one of their own people and no longer wished to support a low caste candidate. The success of this particular Ahir farmer in agriculture and, to a limited extent, in the village politics have no doubt contributed to the rising social status of the Ahir community as a whole. They are now more part of the village society than twenty years ago when their role in agriculture was still unimportant.

Land Use and Cropping Pattern

The significance of the completion of the Ukai dam in 1971 for the evolution of the cropping pattern in Kesala can hardly be over estimated. Canal water became available during the dry season and not ony during the monsoon when in fact it was least needed. Table 8 shows the cropping patterns for the agricultural cycles of 1982-1983 and 1985-1986.

Between the early 1960s and the 1980s the cropping pattern changed completely. Cotton has disappeared altogether, while the area under *jowar* is no more than a shadow of what it used to be. These 'dry' crops have been substituted with irrigated crops. The area under paddy tripled, vegetables gained importance, and especially sugarcane became very popular. The total area under irrigated crops increased from 139 acres in 1964 to 645 acres in 1986. Kesala is not unique in this respect, of course. The same trend is visible in large parts of the entire command are of the canal system. In Table 9 the cropping pattern in the common area are shown for five consecutive years.

We can conclude from these statistics that sugarcane has become the major cash crop in Kesala, as well as in the entire command area. The figures illustrate furthermore that the main objective of the Ukai-Kakrapar system, a substantial increase of the area under food crops, has not been achieved. On the contrary, in the early 1950s, before canal irrigation was introduced, a total of 1,17,900 hectares were cropped with paddy, *jowar* and wheat. [Government of Gujarat, 1972]. By the year 1982 this area had dwindled down to 43,200 hectares. The area under sugarcane, on the other hand, increased from next to nothing in the 1950s to no less than 90,800 hectares. This trend was not anticipated in any of the official cropping pattern forecasts, although one might have expected it in view of the strong tendency towards commercial agriculture.

In Kesala sugarcane is not cultivated by all farmers. It is, on the contrary, grown primarily on Anavil and Patidar land. 80 per cent of the total area under cane either belongs to or is rented by farmers of these castes. Roughly 40 per cent of the area is controlled by the two largest farmers of the village. There are several possible explanations for the uneven distribution of the cane cultivation between the farmers of Kesala. The explanation most often heard is that only middle and large farmers can afford the investments necessary to grow cane. It would seem obvious then that mainly Anavils and Patidars grow this crop, since the majority of the larger farmers belong to these castes.

Table 8: Cropping Patterns in Kesala in 1982-83 and 1985-86 Compared to the Cropping Pattern in 1964

(Area in acres)

Crops	1982/1983	1985/1986	1963/1964

However, there are several reasons why I do not find this explanation satisfactory. In India as a whole, most sugarcane is grown on small peasant holdings [Atwood 1985:60]. Data from Maharashtra show that in this major sugar producing state 80 per cent of the cane cultivators are small farmers who grow this crop on plots of one or two acres [Sathe 1986 : 737]. These statistics demonstrate clearly that size of landholding need not be a constraint. In Kesala as well, there are a few small farmers who cultivate cane, but they are exceptions. Lack of sufficient funds cannot explain the different pattern in Kesala. The co-operative society is willing to provide credit to those who cannot afford the initial investment and, furthermore, most households have additional sources of income.

A more appropriate explanation is the differential access to canal water. The introduction of canal irrigation triggered the cultivation of cane in the first place and it is therefore not surprising that unequal distribution of water between farmers will also affect the distribution of cane cultivation. A large proportion of the fields near the irrigation canal is cultivated by either Patidars or Anavils. As is often the case in canal irrigation systems, these fields receive a larger and more regular supply of waer than those situated in the tail-reaches of the command area. The assumption that access to canal water is the main reason why sugarcane is primarily cultivated by Patidars and Anavils is supported by the fact that in Kesala cane is grown almost entirely on fields near the canal.

Most kolis and Ahirs cultivate land in the tail-reaches of the village command area and cannot grow cane, even if they wanted to. This state of affairs constitutes an important difference with the situation in 1964. In those days all farmers, small or large, cultivated the same crops: paddy, *jowar* and cotton. Nowadays, Patidars and Anavils are increasingly specialising on cane, while the other farmers stick to crops such as paddy, wheat and vegetables which do not require as much canal water as sugarcane. Since cane is a very profitable crop, differences in prosperity are no longer related to size of landholding only, but also to the type of crops a farmer is able to grow on his land.

The same trend, though on a much larger scale, prevails in the command area of the Ukai-Kakrapar system as a whole. The sugarcane areas are concentrated around top-reaches of the main canals, i e, in Surat district. The *talukas* in Valsad district and the coastal tracts receive a smaller and less regular supply of canal water, because the sugarcane farmers in Surat district need a disproportionately large share of the total supply available [Government of Gujarat: 1978].

The growing reliance on canal irrigation and the subsequent changes in the cropping pattern have affected Kesala in many ways. I want to discuss here five aspects of this change: marketing arrangements, labour relations, mechanisation, government intervention and, finally, new types of dependency relations.

Marketing of the Agricultural Produce

When cotton disappeared from the fields, the co-operative ginning factories lost their reason for existence. The co-operative movement is, however, stronger than ever before. Paddy is marketed through the village co-operative and a federation of paddy co-operatives in Navsari. The same applies to the marketing of vegetables. These crops are no longer cultivated only for private consumption, but primarily for the market. The most important and impressive co-operatives are no doubt the sugar factories. In Maroli Bazar a medium size factory processes and markets the sugarcane grown in the area. The impact of this co-operative factory on agriculture is large. Factory personnel provide the farmers with the latest information on new crop varieties, planting techniques, and the right ways to apply water and fertilisers. They regularly check the sugar content of the cane and decide on the basis of this information when the crop should be harvested. The cutting as well as the transportation are organised by the factory. In fact, the farmers only have to plant and irrigate the crop. Apart from the high market value of cane, this comprehensive approach has certainly contributed to the popularity of this crop.

Each sugarcane growing farmer is a shareholder of the factory. The number of shares he holds determines the size of area he is allowed to grow cane on. The more shares, the larger the area. The growing popularity of cane is reflected in the rising value of these shares. Originally one share cost Rs 500. In Bardoli these shares are now sold among farmers for no less than Rs 20,000. In Kesala the value of one share had increased to only Rs 3,000 in 1986. The lower value here was probably due to the fact that cane cultivation started later in the Maroli area than in Bardoli. In view of the rapid expansion of the area under cane in Kesala over the past few years, we can safely assume that the value will rapidly increase here too.

Changing Labour Relations

Initially, the introduction of perennial canal irrigation promised to be beneficial to both farmers and Halpatis. Higher yields, multiple cropping, and new work, such as irrigating the fields and driving a tractor provided more agricultural employment. According to Breman, who studied the position of the Bardoli Halpatis, the growing dependence of the rural elite on local labour and the subsequent danger of rising wages, induced the large farmers to recruit labour from other parts of South Gujarat and Khandesh in Maharashtra [Breman 1984: 383].

The migrant labourers are hired by the farmers for the planting and harvesting of the paddy crop and by the sugar factories for the cutting of cane. From October until June large improvised camps appear near the villages and in the vicinity of the sugar factories. A salient detail is that many of these migrants are tribal peasants who were displaced by the Ukai reservoir and the submergence of some two hundred villages. The oustees were given small plots of infertile land in compensation and although irrigation facilities were promised, none were ever constructed [Mankodi and Gangopadhyay 1983: 41]. To make ends meet they have to leave for the central plain in search of work. During their fieldwork in the eastern, tribal parts of Surat district Mankodi and Gangopadhyay observed how

> ...about one and a half to two dozen trucks loaded to capacity with labourers passed daily down the Nizar-Ucchal road. ...There were caravans of close to 100 bullock carts and trains both loaded inside and on top of the roof with migrant labourers from Khandesh. In Ucchal a fleet of 28 chartered private buses was waiting to transport the workers to work in the sugarcane fields and factories in the command area [1983: 49].

The sugar factories of Khandesh use the same strategy as the factories in south Gujarat. They attract labour from eastern Maharashtra, thus forcing the local Khandeshi labourers to migrate to south Gujarat. The special problem of the Halpatis is that there is no place for them to migrate.

Table 10: The Number of Tractors in Valsad and Surat between 1971 and 1981

to. Especially in Bardoli *taluka*, the heartland of sugar cultivation, the Halpatis have protested violently on a number of occasions against their exclusion from the labour market.

In Kesala there are no such violent protests yet, although the farmers use migrant labour to cut the cane and plant and harvest the paddy crop. Many of the Kesala Halpatis are, however, still employed as agricultural labourers. The middle and large farmers employ one to five Halpatis on a permanent basis, while the wives of these workers work in the households of Patidars and Anavils as maids. Both men and women are paid in cash as well as in kind. The wages are below the legal minimum, but in addition food and some clothing are provided. Some of the patronage elements, which characterised the traditional *halipratha* labour regime, have not disappeared yet. It is still customary for farmers to lend their workers some money when they want to marry. When asked for the reason, the farmers answered that a loan assured them of the workers' loyalty. For the same reason it is not unusual that farmers give their permanently employed labourers some money to visit the cinema once in a while.

It is not easy to predict how the position of the Kesala Halpatis will develop over the coming years. Until 1986 the negative effects of the increasing reliance on migrant labour had been averted partly because elements of patronage still characterised the labour relation and also because Kolis started employing local labour. However, in view of the rapid expansion of the area under sugarcane, it is not unlikely that the position of the Chhinam Halpatis will deteriorate in the near future.

Mechanisation

A further consequence of canal irrigation and the changing cropping pattern is the mechanisation of agriculture. To be more precise, mechanisation is not a consequence of irrigation itself, but of the increasingly capitalist outlook of the larger farmers. Irrigation and the cultivation of sugarcane gave these farmers the opportunity to mechanise. An important part of this process of mechanisation is the use of tractors. Over the past fifteen years the rising profits have been invested more and more in this very expensive implement. Table 10 shows the increase in the number of tractors in Surat and Valsad between 1971 and 1981.

In addition to the figures presented in this table, I should mention that in 1961 no more than 50 tractors were registered in both districts taken together [Breman 1984: 45]. In 1981 this number had gone up to no less than 3,232. The number of farmers who use a tractor is even higher, because many tractor owners rent their machines to those who cannot afford to buy one.

In Kesala too, six tractors were bought over the past fifteen years. They were bought by two Anavils, two Patidar farmers and the large Ahir farmer. The largest Patidar farmer even managed to buy two. These five farmers hire their machines to those who want their fields cultivated. Due to irrigation the soil has become hard and tough, making it increasingly difficult to cultivate the land with a plough and a team of bullocks. The tractor is driven by one of the Halpatis working for the tractor owner and not by the farmer who hires the tractor. The rent is a fixed amount and payment can usually wait until the crops are harvested and marketed. The use of tractors has become very important in the agriculture of Kesala. This is first of all due to the condition of the soil, but also because timely preparation of the land will determine whether the farmer is able to grow another crop on his fields later in the year.

The profits made from the cultivation of sugarcane have not only been invested in tractors, but also in additional tubewells. In 1964 there were only three tubewells in the village. By the year 1986 this number had gone up to twenty. It may sound paradoxical that the number of tubewells has increased, while at the same time the use of canal water has become very popular. The answer to this riddle is that most tubewells were installed by Patidars and Anavils on their land in the tail-reaches of the village command area. Due to the fragmentation of landholding these farmers control land in both top- and tail-reaches of the command area. The irregular supply of canal water in the tail-sections forced some of the larger farmers to arrange their own supply.

Government Intervention

The introduction of perennial irrigation after the completion of the Ukai dam combined with the introduction of the 'green revolution' technology, resulted in increased and more permanent intervention by government agencies. The village level extension personnel, the *gram sevaks*, were assigned an important task in instructing the farmers about new crop varieties and techniques of cultivation, the application of fertilisers, pesticides, herbicides, and the right use of irrigation. During my stay in Kesala, the response of most farmers to the activities of the *gram sevak* was not very positive. The small farmers complained that he was only interested in the large farmers, while the latter expressed their low opinion of the *gram sevak's* knowledge of agriculture.

The role of irrigation personnel is more important in this respect. Indian canal systems are maintained and operated by the irrigation department and farmers are dependent on government officials for the timely and adequate delivery of canal water. At the village level the farmers are dependent upon the actions of irrigation field staff. They open and close the outlets and check the water flow in the fields. The power of these junior ranking officials is far greater than their low position in bureaucratic hierarchy would suggest [see Wade, 1978]. Most of the farmers I interviewed made very clear that it is of considerable importance to maintain a good relationship with the gate operators.

The dependence of farmers on irrigation personnel is enhanced by the absence of a local water users society. Whenever conflicts over the distribution of canal water arise, the parties involved can only approach irrigation officials for a solution. The village *panchayat* has no formal duties with respect to irrigation and the *sarpanch* was very reluctant to act as a mediator between quarrelling farmers.

Relations of Dependence

A final consequence of the new agricultural practice in Kesala are the new relations of dependence between various groups of farmers. I want to distinguish between two types: the first is directly related to the differential access to water, while the second results from the transformation of agriculture in general.

Let us start this discussion with the second type. John Harriss observes about the use of tractors in a district in south India that

> Tractors are attractive to many of the farmers because of their contribution to timely cultivation; because they make the cultivation of large areas of dry land possible, ... Tractors are also attractive because of the profits which the farmers think they can make by hiring them out. . . [1977: 227].

There is one more advantage to the ownership of a tractor. In Kesala it is used as a means of control over other, smaller farmers. The tractor owners of Kesala assured me that they are willing to hire their machines out to anyone, even if the landholding is so dispersed that ploughing becomes a difficult and time consuming affair. However, they also admitted that a bad or cool relationship could result either in a refusal to rent the tractor out or in the demand for immediate payment of the rent, instead of waiting until the crops are marketed. The largest Patidar farmer is known to use this tactic occasionally in order to demonstrate his power over others.

Another example of dependence between farmers which developed in the wake of canal irrigation has to do with the availability of labour. We have seen how the introduction of perennial irrigation resulted in an in-

reased demand for labour due to higher ields, multiple cropping and the expansion of the area under the labour intensive paddy rop. The greater reliance of Kolis on wage-abour is important too. Many small and ven middle farmers face a shortage of abour during the peak periods of the agri-ultural cycle: the planting and harvesting of paddy. Occasionally they have to contact he large farmers of the village to 'borrow' a few of their workers for a couple of days. There are two reasons why these large armers have better access to labour than the maller farmers. Firstly, they employ a fair number of local Halpatis on a permanent basis. Secondly, their hold over migrant abourers is stronger. The groups of migrant abourers who travel to the central plain to harvest and plant the paddy crop prefer to work for the large farmers, because this way they can earn sufficient money without having to change employers too often. New employers mean new negotiations about wages. Another advantage is that they are assured of work later in the year when the paddy has to be planted or harvested. The leaders of these groups agree to return and wages are fixed in advance.

The third type of dependence which is related to the transformation of agriculture concerns the access to information. The large farmers have access to more and better information about the market value of crops, the availability of new varieties, other cultivation techniques, etc, because of their contacts in the sugar factory and the co-operative movement in general. The Kesala *sarpanch* has no doubt the best connections. First of all he is the chairman of the sugar factory and therefore well informed about the future policy of the factory, new varieties, and government policies. He is furthermore a member of the governing boards of several federations of co-operative societies. Finally he is a member of the Canal Advisory Committee which reviews the functioning of the canal system in the Maroli area. He and other farmers are contacted frequently by other farmers with questions about the market value of crops, the quality of seeds, the best way to prepare the fields, and the availability of canal water. This kind of information is of more importance nowadays than in the early 1960s, when the farmers' choice of crops was very limited. Canal irrigation has provided the cultivators with the opportunity to grow a wider variety of crops.

The final aspect of dependence concerns the differential access among farmers to irrigation. We have already seen that the Patidar and Anavil farmers control most of the land near the irrigation canal. The smaller, tail-end farmers cannot irrigate their fields until the top-end farmers are finished or kind enough to release water. The irrigation field staff are not willing or just unable to look after the interests of the tail-end farmers. The fact that the large farmers have installed tubewells on their tail-end land, only serves to re-inforce the dependence of the smaller farmers. The latter can buy tubewell water from the well-owners when the supply of canal water is insufficient. In 1986, the going rate for one hour of tubewell irrigation was Rs 15. The large farmers are, therefore, not only in the position to benefit most from canal water, but they can also make a profit by selling water to those farmers who are unable to secure an adequate supply of canal water.

CONCLUSION

The description of agrarian change in Kesala over the past two decades indicates clearly a strong trend towards capitalist farming. This trend is, however, largely limited to the larger landholders. In the early 1960s, agriculture was already commercialised and wage-labour was used on a permanent basis by especially Patidars and Anavils. These castes had been the peasant vanguard in the process of commercialisation during the 19th and early 20th century. The construction of a large-scale canal irrigation system in south Gujarat has offered these farmers the means to transform from commercial farmers into full-fledged rural capitalist entrepreneurs.

Until the 1960s, the productivity of land was severely limited by the lack of sufficient irrigation facilities. A small number of farmers had installed private tubewells, but these incidental investments could not lift agriculture to a higher level of production. By and large, agrarian development remained on the level of dry and rainfed farming. There were, therefore, not enough incentives to invest profits in extra land, more sophisticated technology and a wider variety of crops. The introduction of perennial canal irrigation in the early 1970s changed this situation radically. *Jowar* and the traditional cash crop cotton have disappeared almost completely from the fields, while the cultivation of the far more profitable sugarcane crop boomed to an extent unforeseen in any of the official cropping pattern prognoses. In Kesala, perennial canal irrigation resulted initially in an increase of the area under paddy and vegetables. Nowadays, these crops are no longer grown only for home consumption, but primarily for the market. The cultivation of cane was taken up later than in other parts of the command area (notably the core region of Surat district), but in recent years the area under this crop has increased rapidly. The popularity of cane is, first of all, related to its high and stable market value. The active role of the sugar factories is of importance too. They co-ordinate and supervise the cultivation, processing, and marketing of the sugarcane crop

and they organise the recruitment of labour for the harvesting and transportation. The canegrowers have delegated the decision-making about production quota, the use of wage labour and the right time for harvesting to the management of these factories. In Kesala, mainly Patidars and Anavils have been able to benefit from the sugarcane boom. They have invested the high profits in machinery, the permanent use of wage labour and extra land. The eagerness among the larger Patidar and Anavil farmers to acquire extra land has resulted in the reappearance of tenancy relations. Tenancy is frequently associated with the persistence of feudal agrarian structures. It would clearly be wrong to make this conclusion about agriculture in Kesala. Land is no longer rented by small cultivators on a crop-sharing basis, but on the contrary by the large farmers. Their main motive is to evade the regulations of the Land Ceiling Act. Another reason could be that they prefer to use their capital to increase the productivity of land, instead of using it to buy land.

The dividing lines between various agrarian classes are more pronounced in contemporary Kesala than in the early 1960s. Land is concentrated in fewer hands. In 1964, 34 farmers owned more than 10 acres and 72 cultivators had to make do with less than 5 acres. In 1986, only 26 farmers owned more than 10 acres, but the size of holdings had increased considerably. The large farmers constitute the capitalist elite of the village. The cultivation of cane has enabled them to invest in tractors, tubewells, land and labour. The Patidars and Anavils take the lead in this process, although some of the larger Koli and Ahir farmers have been able to participate too. Most of the Koli cultivators are, however, increasingly relying on urban wage labour for their incomes. They do not invest in land or more sophisticated technology, while their reliance on local agricultural labourers is more related to status considerations than economic calculations. In view of this trend, it would hardly be surprising if many small and marginal Koli farmers were to withdraw from agriculture altogether and rent or sell their land to larger Koli landholders, Patidars, Anavils or even Ahirs.

The Ahirs show a strong interest in farming, although they have taken up agriculture only recently. Contrary to most Kolis, they do invest wages and profits in the agricultural enterprise. The level of surplus generated is, however, low due to the small size of their holdings. It remains to be seen whether they will be able to expand their holdings in competition with the economically stronger Patidars and Anavils.

The introduction of canal irrigation has affected the position of the Halpatis least favourably. In 1986, the labour relation between the Patidars and Anavils on the one hand and the Halpatis on the other, was still characterised by some pre-capitalist elements reminiscent of the traditional *halipratha* system. The larger farmers are, nevertheless, relying more and more on migrant labourers and the further increase of the area under sugarcane will probably result in a deterioration of the Halpatis' position.

Notes

[I would like to express my appreciation to Hein Streefkerk of the Department for South and Southeast Asian Studies of the University of Amsterdam and to Enno Hommes of the University of Twente, for their valuable comments and suggestions.]

1 I have decided to change the name of the research village in order to protect the privacy of my informants.

2 The study by Enno Hommes was primarily concerned with the impact of a variety of development programmes. At present, Hommes is head of the Technology and Development Group of the University of Twente, The Netherlands.

3 The average amount of rainfall ranges from 2000 mm in the southern part of south Gujarat to 1500 mm in the north.

4 The high and stable market value of sugarcane is partly due to the policy of the government of India. 65 per cent of the processed sugar is bought by the government at a fixed price, while the remaining 35 per cent is sold on the free market at a far higher price [Breman 1978: 1321].

Large Dams: The Right Perspective

Ramaswamy R Iyer

We cannot, on environmental grounds, say 'No' to large dams and reservoirs; nor can we, having regard to projections of demand and availability, accept the view that there is no need for such projects. We should certainly accord priority to the utilisation of the potential already created, the reclamation of the potential which has been lost through misuse, and a vast improvement in water management (including both economy in use and recycling). We must encourage extensive local water-harvesting, and undertake re-greening and other measures to retard the rate of run-off and improve the retention of water in the ground. We should also place a much greater emphasis than in the past on minor irrigation, which calls for less immediate investment, promises quicker results, and presents fewer problems. Possibilities such as the use of seawater and the tapping of deep underground aquifers also need to be examined. However, we cannot rule out investment in at least some large-dam projects. Large and small projects, and the use of surface water and groundwater, have to be integral parts of an overall plan of land-use and water-use for a drainage basin or watercourse system as a whole. At the same time, considering the heavy costs (financial, human, social and environmental) involved in large-dam projects, we have to be highly selective and extremely cautious regarding approvals to such projects.

I

Introduction

THE 'big dam' controversy which has been dormant for a while has once again become active. Among both the opponents and the supporters of big dams there is a wide range of persons: the scholarly and thoughtful; the well-meaning but ill-informed; the highly partisan; the populists; and the charlatans. Unfortunately, even at the most distinguished level on either side there seems to be a failure to see the force of the opposite point of view. Most papers and speeches on the subject tend to be partial statements. Anyone who refuses to declare his allegiance to one or the other point of view at the outset may fail to get a proper hearing. Moreover, the general polarisation of attitudes on the environmental aspects prevents an adequate discussion of other important aspects.

Despite that discouraging preamble, the present paper will attempt a discussion of the subject in all its complexity. It will be essentially an examination of issues, both environmental and other, and not a scholarly treatise; and it does not propose to attack or defend specific projects. It is to be hoped that the length of this paper will be found worthwhile, and the occasional statement of the obvious accepted as a necessary part of the effort at comprehensiveness (or an approach to it). Even with this length, the paper will be able to present the numerous issues in no more than a summary fashion; a fuller discussion would have needed a book.

II

'Interference with Nature' Argument

At the very threshold of the discussion, it is necessary to grapple with the guardian at the gates, namely, the 'interference with nature' argument. The argument is that the course of a river represents a natural regime; that the river and its environment including human habitations, tribal settlements, forests, and the entire flora and fauna of the area form a natural ecological system; and that any interference with this is fraught with danger and must be avoided. A moment's reflection will show that this line of argument has much larger implications and ramifications than might appear at first sight, and will take us far beyond an opposition to big dams.

All of human life and development involves an interaction with nature. Humanity, no less than wildlife, is part of nature, and it is the distinguishing characteristic of humankind to modify the environment. The discovery and use of fire, the establishment of human settlements on the banks of rivers, the practice of agriculture: all these constituted 'interferences' with nature. The avoidance of interference with nature is an impossibility.

However, it is obvious that with the advent of industrialisation there was a dramatic change in the kind of impact that humanity could have on the environment; for with industrialisation came an organised assault on natural resources as well as a large-scale pollution of the environment. It has been pointed out that the industrial use of timber (in particular for the paper industry) and exports of timber to foreign countries as well as to urban markets within the country led to changes in the pattern of ownership of forest land and to extensive deforestation. It is well known that the forest departments of the state governments have been regarded essentially as 'commercial' or revenue-earning departments. Even the famous Forest Research Institute at Dehra Dun was in the past mainly a Timber Research Institute. The protection and conservation of forests is a relatively recent concern. The profligate use of energy (until the 'oil price shocks' changed our attitude to energy consumption) is also a familiar story. By now there is also adequate awareness of the industrial pollution of air and water: the dangers of industrial accidents of which Bhopal and Chernobyl were horrifying examples; the fouling of the atmosphere by automobile exhaust in large cities; the phenomenon of acid rain; the poisoning of the seas and coastal areas because of oil-spills from tankers; the depletion of the ozone layer; the problem of disposal of nuclear waste; the warming of the atmosphere and the greenhouse effect; and so on. Even modern agriculture carries with it the dangers arising from fertiliser and pesticide residues in the soil and in agricultural produce; and insecticides and chemicals find their way into dairy and meat products. Not merely forest-cover but the entire environment is threatened, and it is threatened not merely by dams but by the whole course of development that western civilisation (and following it, the rest of the world) has adopted—which first makes heavy inroads into natural resources of all kinds, and then inflicts grave damage on those very natural resources and the air that we breathe and the water that we drink. However, while there is a groundswell of concern about environmental conservation and protection and a demand for more stringent pollution control standards and the stricter regulation of industry, there is no general call for the banning of industry (except for some opposition to nuclear installations) or of large-scale commercial agriculture. Why then is there a campaign for banning dams and reservoirs?

Large dams are not a separate phenomenon but a part of the kind of developmental process that has come to prevail. If we attack dams and reservoirs on the ground of interference with nature, we shall have to go further and attack the totality of the kind of demand-based, demand-multiplying, technology-driven, 'growth'-oriented development that is relentlessly marching forward, and turn to modest ways of living which make much less of a demand on natural resources and have a relatively low impact on the environment. There may indeed be a case for such a change, but it is not clear that the opponents of large dams are in fact willing to accept this. This paper does not

ropose to argue either for 'modern' ideas f development or for the Gandhian alter-ative; the point that is being made is merely hat having chosen certain modes of evelopment it will be inconsistent for us to ingle out one element or component for ondemnation.

Nor is it correct to assume that in the bsence of a particular project the environ-nent would have remained undisturbed: nuch of the denudation of the forest cover akes place for reasons not connected with lams and reservoirs. In fact, in many cases he 'forest lands' which fall within the ubmergence area of a project have already een so degraded as not to merit the descrip-ion. Indeed it is possible that such projects, f well conceived and executed, may even nave a benign impact on the environment. They facilitate the provision of finance and organisation for essential measures which may eventually lead to a situation better than what would have come to pass in the absence of the projects; and they may raise income levels and generate secondary occupations, and reduce the need to cut trees for fuel or fodder. The current opposition to large dams and reservoirs stems from bitter past experience in relation to many such projects which were marked by an exclusive concern with engineering structures and a neglect of human and environmental aspects; but this need not be an inescapable characteristic of such projects.

A general call for a ban on dams and reservoirs on the ground of interference with nature cannot be sustained. We have to look at the extent of interference with nature in each case and decide whether it is so great as to be totally unacceptable, or whether it is acceptable subject to a number of measures being taken for mitigating if not completely offsetting the impact. It may be argued that the attacks are in fact on specific projects, e g, Silent Valley, Tehri, Sardar Sarovar, Narmada Sagar; but in many of the articles and speeches on these projects there is an undercurrent of hostility to big dams *per se*; and there are certainly papers, reports and articles which explicitly call for a ban on big dams.

What is needed is that a high-level interdisciplinary group of professionals (including some or all of the following: dam engineers, specialists in earthquake studies, groundwater specialists, agricultural specialists, soil scientists, experts in land use and water use, environmentalists and ecologists, sociologists, economists, and others, as needed) should make fairly detaileded preliminary studies which would eliminate all those sites which are likely to be totally unacceptable. (Such an exercise will fail completely if the engineers were to resist stoutly the elimination of *any* site or if the environmentalists were to insist on ruling out *all* the proposed sites. We have to assume that the exercise will be undertaken with openness of mind on the part of all.) This will ensure that at least in future a good deal of time and effort will not be wasted on detailed project formulation with reference to sites against which there are fundamental objections. This will then leave a certain number of sites for which the preparation of detailed projects can be undertaken. These will of course have to be subjected to a thorough examination from all points of view; such an examination may again result in a negative decision on some projects, but there may be others which can be approved subject to certain conditions.

III
Case for Large Dams

A variant of the environmentalist opposition to large dams is the seemingly thoughtful suggestion that we do not really need them. So far as the present writer is aware, this proposition has not really been argued out in detail. It can mean one of two things. The first is that the same purpose can be served through a large number of small projects. This, however, is not necessarily true. If the same quantum of water as in a large reservoir has to be obtained from a large number of small storages, the total surface area to be submerged may, in fact, be larger as each would be a shallow reservoir; for the same reason, the loss of water by evaporation will be much greater. In any case, that is a hypothetical proposition; not all large projects can be broken down into a number of smaller projects. Water-impoundment is location-specific, and if we reject a favourable location which permits the impoundment of a large body of water, we cannot be sure of finding a large number of locations for smaller storages which together will impound the same quantity of water. Moreover, small dams can be built only on small streams or tributaries. It is the large rivers which carry the bulk of the annual flows and any storages on the main rivers will necessarily be in the nature of large projects. There is no either/or between large and small projects; there is, or ought to be, a complementarity among such projects in an overall plan for basin development.

Further, a large number of small storages with low heads of water may not be able to generate the same quantum of hydroelectric power as one single large storage with a high head of water; and some of the power-generating capacity has to be of the hydroelectric kind. (Alternatives such as thermal generation or nuclear power also create environmental problems of different kinds; and the use of coal, oil or gas involves the depletion of finite resources while hydroelectric generation utilises a renewable resource. In any case, where the possibility of hydroelectric generation exists, it is the best means of providing peaking stations.) While there is a place in overall power planning for low-head generation and run-of-the river schemes, they will be subject to the seasonality of the flows and will not have the dependability and resilience which only large storages can provide.

The second, and more plausible, meaning of the statement that we can do without large projects is that we can manage with a combination of other measures such as local water conservation *in situ*, water harvesting, the use of groundwater, greater emphasis on rainfed agriculture, economy in water use, better water management, etc. While all these things need to be done, it does not follow that they will be adequate for meeting the projected future demand for water.

It has always been an accepted proposition that the vulnerable dependence of Indian agriculture on the vagaries of the monsoons must be reduced through the storage of water for irrigation. The disenchantment with canal irrigation which has set in because of the injudicious use of water and its ill-effects cannot undermine the validity of that basic proposition. Certainly, dryland farming practices need to be greatly improved and the productivity of rainfed agriculture stepped up; but it does not follow that irrigation has ceased to be important. If food production in this country has gone up from 50 million tonnes in the fifties to the present level of 170 million tonnes, irrigation has surely been one of the factors responsible; without irrigation, fertilisers and high-yielding varieties of seeds could not have been used. Irrigation will continue to be needed if the production of foodgrains is to reach a level of 240 million tonnes in the early years of the next century to feed a projected population of 1000 million; and it will have to be a mix of different kinds of irrigation, including canal irrigation based on major projects.

Even the argument that minor irrigation needs greater attention, while it has much force (and we shall revert to this later), does not warrant the conclusion that it is a substitute for major projects. A great deal of what we call minor irrigation is linked to the use of groundwater. In the absence of large reservoirs, minor irrigation will depend even more heavily on groundwater (while at the same time the recharge provided by seepage from canal irrigation will diminish). Apart from the energy requirements for lifting water, this could lead to an over-exploitation of groundwater, which cannot be sustained for any length of time. Recent experience has shown that under prolonged drought conditions surface water tanks and even tubewells fail, and that one has to depend on the large water storages to maintain a modicum of supply. If the production of foodgrains during the drought years did not decline to disastrously low levels, it was only because of irrigation from large projects.

It has for long been urged that there should be a 'conjunctive' use of groundwater and surface water. This does not mean merely the use of groundwater to supplement surface water or vice versa; it means the integrated planning of the development and use of the totality of water resources, including atmospheric water, surface water and groundwater. In this understanding of

the concept of 'conjunctive' use, the augmentation of the availability of surface water through large projects is as essential and relevant as the augmentation of groundwater resources through an improved knowledge of such resources.

Industries need water too, for both process and cooling purposes and for townships; so do municipal systems, whether rural or urban, for supplying water for drinking, washing and waste-disposal purposes and for fire-fighting. Projections of total water demand for all uses (agricultural, industrial, municipal, etc) are somewhat conjectural, but such figures as are available seem to indicate that the future is going to be very difficult.

Various estimates have been made of the total water resources of the country by diverse agencies. The figures in the most recent document, namely, the brochure entitled "Water Resources of India" by the Central Water Commission (April, 88) are as follows:

1 Nationally available surface water resources	1880 Km^3
2 Actually utilisable surface water resources (i e, the quantum that can be actually utilised having regard to topographic, locational and other constraints).	690.309Km^3
3 Actually utilisable groundwater resources.	418.540 Km^3
4 Total utilisable water resources	1108.849 Km^3
Say (2+3)	1110.000 Km^3

As against these figures of availability projections of total annual water demand for all uses are as follows:

2000 AD	750 Km^3
2025 AD	1050 Km^3

It will be seen that practically the entire utilisable water resources of the country will be actually needed by 2025 AD. We are, therefore, likely to experience serious water shortages as the years go by. In fact the situation may well be even more serious than what the above figures indicate, as the demand projections seem likely to be underestimates, and the figures of 'utilisable resources' do not refer to resources which are *currently* utilisable, but only what is *potentially* utilisable if all the possible storages and transfers are built. In other words, the figure of utilisable resources *assumes* the understating of a number of large projects. (As against the total annual flow of 1850 Km^3, storages built or under construction have only a total gross storage capacity of 275.948 Km^3 and a live storage capacity of 222.072 Km^3.)

One may have serious doubts regarding some of these figures, but water scarcity is a reality: a present reality, not merely a future possibility. Already severe shortages are being experienced in most major cities and the hardship is acute in some. Delhi, even though it is close to the Yamuna, has to make a heavy draft on the Ravi-Beas waters through the Bhakra system, and is hoping for an earmarked allocation from the Tehri storage when it is built. Bombay draws water from the Tansa, Vaitarna and Bhatsa storages. Some cities (e g, Madras, Bangalore) are awaiting the completion of major projects (Telugu Ganga, Kavery Stage-III) to ease their extremely difficult situation; and in one (Madras) the exploitation of groundwater for meeting the city's water-supply needs is reaching dangerous levels. There have been occasions when water has had to be carried to Madras through trains and tankers. The situation in general is likely to get worse rather than better.

That picture of mounting demand and severe scarcity certainly points to a need for demand management. Economy in water use needs to be enforced, wastage penalised, the scarcity value of the resource clearly signalled through proper pricing, technological innovations undertaken for reducing water requirements whether for industry or for agriculture, and the re-use of once-used water promoted. However, these measures by themselves cannot bridge the gap between supply and demand; an augmentation of supplies will also be necessary. As the ultimate source of supply, namely, precipitation, cannot be increased, augmentation means mainly three things: (i) extending our knowledge of the country's groundwater resources and making more of those resources usable through processes such as reverse osmosis; (ii) extensive programmes of re-greening to retard the rate of run-off and improve the retention of water in the ground, as also of water-harvesting and conservation *in situ*; and (iii) bringing more of the country's notionally available surface water resources into the category of utilisable resources through the building of some large storages (i e, dams and reservoirs) where these are techno-economically feasible. We have to bear in mind the marked seasonality of the flows (particularly in the peninsular rivers and to a lesser extent in the Himalayan rivers), as also the extreme regional variations. Much of the precipitation occurs within a few months of the year, and even within those months the intensity is concentrated on a limited number of days; and while some areas of the country receive abundant supplies, there are vast areas which are water-short or even arid. It is difficult to see how supplies can be carried over from periods of heavy rainfall to the dry months, or how the water needs of certain areas such as Rajasthan, Rayalaseema, the drought-prone districts of Karnataka, and so on, can be met, without some arrangements for large storages and transfers.

The proposition that we can do without large dams really implies that we can manage with less water. However, the demand for water cannot be substantially reduced without reducing demand of all kinds all round. If we have to do with less water, then we may also have to do with less food, less power, less steel, less coal and less of everything; and settle for ways of living which are less demand-intensive. That point has already been made and need not be laboured again.

However, there are indeed certain possibilities of augmenting our water resources to which adequate attention does not seem to have been paid, namely, drawing water from nature's storages, i e, the seas or deep underground aquifers.

Any inquiry regarding the possibility of use of sea water meets with the response that it would be too costly a proposition. The question of costliness is a relative one of weighing the costs against the benefits, or of costs against alternative costs. It does not seem self-evident that the desalination of sea water and its conveyance over long distances would be necessarily found to be a more uneconomic proposition than alternative means of augmenting our water resources. The costs involved would of course have to be recovered through proper charges and this may in fact necessitate the economic pricing of water, which would be a good thing. Moreover, *prima facie* it would appear that drawing water from the sea may not involve major environmental and socio-economic problems. The possibility certainly seems to warrant more purposeful examination than it has received.

As regards deep underground aquifers, the existence of these (in the Gangetic plains) with vast quantities of water, much of it possibly under artesian pressure, has been postulated by some experts, and the consideration of this possibility has been urged by the World Bank. However, there has been a reluctance on our part (for whatever reasons) to undertake a serious examination of this proposition. Some belated beginnings in this direction seem to have been made in recent years.

However, these are merely possibilities which need to be examined in detail. For the present, the answer to the statement that we do not need large dams is that it is not borne out by facts.

IV

Environmental and Socio-Economic Impact of Large Dams

Let us now turn to the specifics of the environmental impact of large dams (with special reference to irrigation projects). The term 'environmental impact' is used here in the widest sense. There is a curious view that the displacement of people is not an 'environmental' aspect. Whatever we may call it, it is certainly a very important aspect, and it is difficult to see how anyone can object to this issue being raised by the environmentalists.

The environmental impact of large projects of this kind would include:

— the loss of agricultural and forest land through submergence under the reservoir which is created;

— the displacement of people and livestock by the project, and the loss of occupations; and in particular the hardship

caused to the landless and to tribal communities;

- the dislocation of wild life and the possible disappearance of some rare species of flora and fauna;
- the public health problems arising from the large-scale impounding of water (the spread of disease vectors) and possible climatic changes;
- the inherent dangers of large dams (the possibility of cracks and dam-bursts and the consequent inundation of large areas), particularly in regions prone to seismic activity; and the problem of reservoir-induced seismicity;
- the loss of vegetative cover in the upper catchment resulting in excessive run-off and loss of top soil, leading in turn to the accelerated siltation of the reservoir and the reduction of its useful life (this could be regarded as a case of the impact of the environment on the project); and
- the emergence of water-logging and salinity in the command area of the project after some years of irrigation, leading to valuable agricultural land going out of use.

We must also take note of certain socio-economic changes which irrigation projects bring about, though these cannot be brought within the ambit of the term 'environmental'. Land values rise with the prospect of irrigation; rich farmers tend to buy up the land; as water becomes available it gets used up by the farmers in the head reaches, and water-intensive crops are grown, so that by the time the canal extends to its full length, the tail-enders get little or no water; all this results in the accentuation of the differences between the rich and the poor farmers. Attempts to settle project-affected people in the command area are also fraught with difficulty. There are also instances in which flow irrigation assures water supply to water-intensive cash crops such as sugarcane, while in nearby areas even drinking water is scarce. The easy availability of canal water and the political difficulties of pricing it economically lead to wastefulness in the use of water, and this in turn aggravates the water logging problems mentioned above. Lastly, doubts have even been expressed about the introduction of irrigation into arid or desert areas, as it changes established ways of living; for instance, the Rajasthan Canal Project may have the effect of converting an essentially nomadic people practising animal husbandry into agriculturists; or alternatively, it may lead (as in fact it has) to the induction of farmers in large numbers from adjoining states, which could lead to social tensions.

Some of these adverse consequences are readily amenable to remedial measures; some are rather more difficult to deal with; and some are fairly intractable. Among the most difficult problems is the finding of land for settling project-affected people. It is equally difficult to find suitable land for compensatory afforestation to offset lost forests. The re-location and re-training of project-affected people (particularly tribal communities which make a living by hunting and gathering) is a daunting task. The treatment of the upper catchment to prevent the loss of topsoil and the carriage of sediment into the reservoir may present problems, if the project were a large one with the upper catchment far away from the reservoir, and possibly in another state or country. Encouraging economy in water-use, preventing waterlogging, and ensuring equity in the distribution of water also present formidable challenges. Such challenges can and must be met; there is no need to take the gloomy view that certain adverse consequences and social evils are inherent in the projects, and draw the conclusion either that they must be endured, or that the projects themselves should not be undertaken at all.

As against these direct and indirect environmental and social costs, the benefits would consist in the provision of water to arid or drought-prone areas; irrigation leading to incremental agricultural production, income-generation and secondary occupations; and in the case of hydro-electric projects, the generation of power and its contribution to industrial activity, income-generation and employment, as also the role of hydro-electric power in balancing the overall power generation system. (No reference has been made to the generation of revenues, as water rates in general are so low that no significant revenues are yielded by irrigation projects).

In the light of the foregoing summary of direct and indirect costs and benefits, it would appear that the matter is merely one of weighing the costs against the benefits and approving those projects which pass the test of a certain minimum excess of benefits over costs. Unfortunately, the matter is far from simple. There are enormous difficulties in calculating both costs and benefits, and there is a curious reluctance to adopt a proper methodology of evaluation.

V

Appraisal and Monitoring of Projects: Problems

Under the procedure now in force, the major and medium* irrigation and multi-purpose projects of the state governments are referred to the Central Water Commission for examination and submission to a high-level committee known as the Advisory Committee on Irrigation and Multi-purpose Projects set up by the Planning Commission (commonly referred to as the Technical Advisory Committee or the TAC). For the purposes of the present paper, it is not necessary to go into the details of this procedure. Nor need we concern ourselves with certain questions which have been raised in this context, such as the need for the central clearance of state projects, the time taken by the processes of secrutiny and clearance, and so on. Considering the massive outlays involved, the need for carefully appraised investment decisions is quite clear, whether this takes place at the central or the state level, and whatever the procedures. What we are concerned with is the quality of the appraisal and the criteria for the approval of projects.

The first point to note is that the engineering point of view is predominant in both the formulation and the examination of large-dam projects. A project has its origin in an engineering conception with reference to a location which seems convenient for large-scale water-impoundment, and then the utilisation of the water which the project will make available is considered. The sequence is from project to utilisation, and not from identified needs to a project to meet those needs. To some extent this is understandable, as large-scale water-impoundment must necessarily be planned with reference to a favourable location. However, it is surely necessary to provide some basic justification for the proposed project as the optimal answer to the needs of the area in question and of the basin in which it is situated (unless the project involves an inter-basin transfer, which again will need justification with reference to need and possible solutions). We have to ask whether, from the point of view of the planning of land-use and water-use in the basin as a whole, and having regard to the socio-cultural history of the people, the particular area in question is suitable for agriculture or some other activity; whether it should be rainfed agriculture or irrigated agriculture; what the cropping patterns should be with reference to agro-economic considerations and soil characteristics; what kind of irrigation that cropping pattern will need, i e, what combination of groundwater and surface water, and whether techniques such as sprinkler or drip irrigation will be appropriate; and in the light of the answers to these questions, what the water needs of the area are and what options are available for meeting those needs. (The consideration of options should include water-harvesting, small tanks, the use of ground water, and so on.) If within such a framework we reach the conclusion that a large reservoir and canals are the best answer to the needs in a given situation, there are once again some choices to be considered: the precise location of the dam, the height of the dam, different levels of submergence with corresponding differences in damages and benefits, and so on. Such an examination of basic justification and possible options is not presented to the TAC; what is placed before the committee is only a single engineering proposition (including in some cases some relatively minor engineering choices) for approval. Efforts to in-

* The classification of irrigation projects into major, medium and minor in government documents is based on the extent of the culturable command area covered—major: having more than 10000 hectares of CCA; medium: 2000 to 10000 hectares of CCA; minor: below 2000 hectares of CCA.

troduce an approach of the kind outlined above have not been very successful.

Secondly, the manner in which even the specifically proposed projects are appraised for approval leaves a great deal to be desired. The criterion is conformity to an acceptable benefit-cost-ratio. The basic norm is a ratio of 1.5:1, but there are more liberal standards for drought-prone areas, tribal areas, and so on. Questions can be raised both about the adequacy of the basic norm and about the wisdom of lowering the norm still further for certain areas. However, leaving such issues aside, what is particularly unsatisfactory is not so much the standards adopted as the manner in which the benefit-cost-ratio (BCR) is calculated.

The BCR as now calculated is based essentially on the direct project cost and the value of the incremental agricultural production. (There is a host of difficulties, methodological and other, relating to the very concept of the 'irrigation potential' created by an irrigation project, which is the starting point for the calculation of benefits; however, that is a complicated and perplexing question which cannot be gone into in this paper.) The point is that neither the project cost nor the value of incremental agricultural production is a reliable figure.

It ought to be possible to make reasonably firm project cost estimates, given the experience available in this country, but evidently this is not so, judging from the practically open-ended time and cost overruns to which most major irrigation projects are subject. As regards the benefits by way of incremental agricultural production, these are somewhat conjectural, as no one can say with any confidence that the cropping pattern projected will in fact materialise (not to mention the difficulties of valuation). The possibility that the proposers of the project might have tried to adjust the calculations to yield an acceptable BCR cannot be ruled out. This is a very shaky basis indeed for decision-making.

So much for what the reports present; the omissions are even more egregious. There is very little effort to estimate the socio-economic and environmental costs and benefits. The value of the land needed for the project is taken at the estimated amount of compensation to be paid, and a very rough-and-ready estimate of the costs of rehabilitation of project-affected persons is included. No attempt was being made until recently to value the loss of forest cover or of occupations. Some efforts at such calculations have begun to be made under pressure from the ministry of environment, but they are very unsatisfactory. It should not be unduly difficult to estimate and include measures for countering the public health consequences of water-impoundment, but the provisions made are usually *ad hoc* and rough-and-ready, and are inadequate. The cost of treatment of the upper catchment is not generally included in project costs, except in a few cases at the instance of the environment ministry or of aid-giving agencies such as the World Bank. (There is a controversy as to whether in fact this is a legitimate charge on the project cost.) Water distribution and the development of the command area will call for further investments before the expected benefits can be realised, but until recently these did not enter the project cost estimates; 'command area development' was thought of as a separate activity. A few years ago, an integrated approach to project formulation covering everything from catchment treatment to command area development was formally adopted, but this has not yet become fully operational. On the benefits side also, there is little attempt to reckon the secondary and indirect benefits.

Industrial, mining and commercial projects in the central public sector are placed before the Public Investment Board after an appraisal by the project appraisal division of the Planning Commission, which, though not a full-scale socio-economic cost-benefit analysis, is a partial approach to it. No such appraisal is attempted in the case of irrigation projects, though these involve massive investments. Some years ago, a committee set up by the Planning Commission brought out a report outlining a methodology for the economic appraisal of such projects. Perhaps that methodology does not go far enough, but it will be a great improvement on the kind of examination that takes place at present. However, it has not been found feasible to adopt that methodology. There has in fact been considerable resistance to such ideas on the part of those involved in the formulation and examination of such projects.

In fairness, it must be admitted that any attempt at a proper socio-economic appraisal of such projects would encounter serious difficulties. The problematic nature of estimating (and valuing) the incremental agricultural production has already been mentioned. The estimation of secondary benefits is still more difficult. It will be relatively less difficult to evaluate the benefits of power generation, if the project were a hydro-elecric or a multi-purpose project. (Even in such cases, the quantification of the benefits derived from adding a peaking station to the system is not easy; but this is at least attempted—separately—by the central electricity authority.) If the project includes flood-moderation as one of its purposes, the valuation of this benefit also presents problems. On the costs side, it is extraordinarily difficult to quantify the environmental costs. While it may not be too difficult to put a value on the loss of trees or forest produce, how does one quantify the general environmental consequences of the disappearance of forests? The ministry of environment has laid down a thumb rule for quantifying this, but its soundness is open to serious doubt. In regard to the impact on flora and fauna, the absence of a data base makes it difficult to evaluate this and formulate remedial measures. Expensive and time-consuming surveys have to be undertaken, and this is best done *pari passu* wit the implementation of a project, by makin it a part of the project and providin organisation and finance for this activit within the project itself.

There is yet another complication. Ther are costs imposed by the project in the forn of loss of agricultural produce, loss of forest and loss of occupations; and there are othe costs involved in compensation payments fo land acquired or the provision of alternativ land, compensatory afforestation programmes, retraining and rehabilitation measures the provision of financial assistance and infrastructural facilities in the new resettlemen areas, and so on. But some of these costs are in fact intended to counter others, anc therefore the two work in opposite directions. It will be rather misleading tc aggregate all of them; if we do so we must also take into account the resulting benefits, such as the new occupations and the new forests which will arise in due course. In so far as agricultural land is concerned, we can either take the compensation paid as a measure of the loss of agricultural produce and occupations, or we can attempt to estimate the latter in true economic terms; a simple aggregation of the compensation payment and the value of the loss of agricultural produce and occupations would be methodologically unsound. Again, as mentioned earlier, it is quite possible that watershed treatment undertaken as part of a project may eventually result in a better situation than might have prevailed without the project. If so, the costs of such treatment should be offset by the benefits derived from it.

A further difficulty is that costs and benefitis do not affect the same set of people. To some extent, this may be true of all long-term planning for development: one generation saves and invests and another reaps the benefits of the investment. However, in the case of large-dam projects there is the further complication that even within one generation one set of people undergo the trauma of loss of familiar occupations and displacement from areas they have lived in for generations, and others (those who are in the command area of the project or are able to buy land there) derive the benefits of irrigation. In such a situation, how do we weigh the costs against the benefits? Whose costs against whose benefits? The only answer to this is that the rehabilitation measures should be inspired by the aim of not merely mitigating hardship but also assuring to the affected people a quality of life as good as if not better than what they are losing; and this should be a charge on the project. Attempts have also to be made to ensure an equitable distribution of the benefits arising from the extension of irrigation, if necessary through legislation enabling the allotment of land in the command area to the project-affected persons.

Clearly, then, a proper socio-economic cost-benefit evaluation of a major irrigation

(or multi-purpose) project is an enormously complex undertaking. It is true that some agencies outside the government have attempted this in the case of certain projects, but their calculations have been questioned by others. However, to recognise the difficulties is not to conclude that the exercise cannot or need not be attempted. The best possible efforts in the given circumstances must be made, and what cannot be quantified should be taken into account qualitatively. Without such an attempt there can be no basis for rational decision-making.

Our difficulties are not over with decision-making. Having made all kinds of calculations and approved a project, we may find that we have no way of knowing how the project will actually proceed. Leaving aside the problem of corruption, there is the persistent phenomenon of slippages, modifications, additions, scope-changes and cost over-runs, so that in the end the project as executed may bear little resemblance to the project as originally envisaged at the time of approval. Provisions may exist in the project for various matters such as proper drainage, environmental measures, the full rehabilitation of project-affected people, and so on, but there is no assurance that these provisions will be properly and fully utilised. In general, the human and environmental aspects tend to receive much less attention once the project has been sanctioned. The funds for compensatory afforestation may indeed get spent but the afforestation may not take place. In theory, waterlogging and salinity can be avoided but in practice they may not. The project may envisage the 'conjunctive use' of surface water and groundwater, but there is no operative system to ensure this. Water rates are so low as to guarantee the wasteful use of water, so that the full potential of the project may not be realised. Lastly, the maintenance of the assets created does not receive adequate funding or attention, with the result that the benefits begin to decline rapidly. In other words, the costs both direct and indirect are very real (and irreversible) though they are difficult to estimate, but the benefits may elude us.

It is, therefore, clear that a stringent and comprehensive appraisal is not enough; it is equally necessary to establish a strong, well-equipped machinery which will monitor the progress of all aspects of the project: the engineering and construction aspects as well as the rehabilitation, environmental and water-use aspects. A mere reviewing body will not be of much use: if it is to be effective, it must be armed with adequate powers of enforcement. Unfortunately, the existing appraisal machinery is not really adequate, and there is hardly any monitoring or enforcement machinery.

If the Central Water Commission is to undertake a comprehensive techno-socio-economic appraisal of major irrigation projects, it will need to be transformed into a multi-disciplinary body, not merely by the induction of a few persons from different disciplines at the lower levels, but by providing the agricultural, environmental, economic and sociological expertise at the senior levels (including the top level). A major restructuring will be needed to transform what is in effect a central water engineering commission into a central water commission in the real sense. Alternatively, the project appraisal division of the Planning Commission which services the public investment board in regard to industrial projects will have to be expanded to undertake the appraisal of irrigation projects as well; and an appraisal by the PAD should supplement the technical examination by the CWC, and these two examinations together should form the basis for a clearance by the advisory committee.

The establishment of a separate body to monitor the implementation of a project once approved, and to ensure not only that project implementation in its construction aspects proceeds apace but that there is also equal attention to the environmental and human aspects, has not really been tried. So far as the present writer knows, such a body has been set up only in one case, and there too it has not yet become very effective.

It must be added that given the political and the (misguided) popular pressure for such projects and the vested interests that

get built up, it is most unlikely that any machinery will be established at the state level for a rigorous socio-economic cost-benefit analysis of such projects as the basis for an investment decision, or for the effective enforcement of the remedial measures on the human and environmental fronts in the project-implementation stage. Needless to say, under our federal structure, any attempt at the central level to make the appraisal methodology more rigorous or to establish a post-approval monitoring and enforcement machinery will meet with strong resistance from the state governments. It may, therefore, seem to some that recommendations regarding a stringent examination of projects and the strict enforcement of conditions are unrealistic. From this, the drastic conclusion may be drawn that the only solution to the problem is not to go in for such projects at all. However, this too is unrealistic. Whether we like it or not, such projects will continue to be undertaken. We must, therefore, see how best a measure of discipline can be introduced.

Undoubtedly this will be difficult. We have the familiar phenomenon of a large number of 'unapproved' projects, i e, projects which have been taken up by the state governments without central clearance; and even the Planning Commission finds it impossible to refuse to make provisions for such projects. There is also the other phenomenon of 'non-plan projects', i e, major irrigation projects which cannot be included in the plan and made eligible for central assistance because of non-clearance by the centre, and which are, therefore, being financed by the state governments out of non-plan resources. Nevertheless, in spite of these difficulties, we have no alternative but to keep trying to bring about better discipline in this regard through such means as are available to the centre, namely, the requirement (grudgingly accepted by the state governments) of a scrutiny and clearance for inclusion in the plan, and a legal requirement of central clearance under the Forest Conservation Act, 1980. We must use these means to the fullest extent possible and simultaneously build up the right attitudes on the subject through an extensive dissemination of information and analyses.

In this context the point that has been made by several writers regarding the need for openness on the part of the project authorities and the governments concerned is very important. Information regarding all aspects of a project should be freely available; studies by academic institutions, consultancy agencies, voluntary bodies and others should be facilitated, and there should be receptivity and not resistance on the part of the project authorities and the governments concerned to the suggestions and ideas emanating from such outside sources.

It will be very useful to undertake an evaluation of a number of completed major projects with a view to ascertaining nature of the socio-economic and enviro mental impact that they have actually ha the benefits that they have contributed, a the costs that they have imposed. Su studies, of which there are regrettably ve few, would provide invaluable guidance f the consideration of new projects.

VI

Investment Costs and the Fundin Problem

We have not so far considered the fundi problem. The capital costs of major irrig tion projects have been going up sharp over the years, and at the same time the pr jects take longer and longer to complete, ar there is always a heavy backlog of u completed projects for which funds have be provided in each plan. According to t Annual Report of Ministry of Wat Resources for 1988-89, as many as 181 maj projects were spilling over from various pla periods into the Seventh Plan, needing a pr vision of Rs 26,270 crore. However, th actual provision in the Seventh Plan fo major and medium irrigation projects wa only Rs 11,555.56 crore. Clearly, this wa inadequate even for the needs of 'ongoing projects and left hardly any scope for ne projects. In fact, the Seventh Plan gav priority to the completion of unfinishe

irrigation projects which were in an advanced stage and were capable of yielding full or partial benefits in the plan period, particularly those benefiting tribal areas, drought-prone areas and areas with a substantial scheduled caste population; and restricted new starts to medium projects in drought-prone, tribal and backward areas. It also envisaged greater emphasis being laid on minor irrigation programmes which could be completed quickly and start yielding benefits, and the highest priority was to be accorded to measures for the utilisation of the existing irrigation potential. The position regarding provisions to be made in the Eighth Plan is likely to be even more difficult. Priorities will probably have to be still more stringent in the Eighth Plan, and it is difficult to envisage a large provision for new projects. In fact, there will have to be a rigorous review even of the socalled 'ongoing' projects with a view to concentrating on some and completing them; it may even be sensible (though probably politically difficult) to stop work on those projects on which not much progress has been made so far. The position which emerges is that a general debate regarding the desirability of large dams is perhaps somewhat academic, considering that there are hardly any resources for undertaking such projects.

However, this is a question of relative priorities. To rule out major irrigation projects entirely on the grounds of the heavy investment they need and the constraint on resources is to make an implicit priority judgment against these projects and in favour of others in the same sector or other sectors. While giving greater priority to the utilisation of the irrigation potential already created, the reclamation of the potential which has been lost through waterlogging and salinity, local water conservation and a vast improvement in water management, we cannot rule out new projects completely. We cannot say that there will be no new major irrigation projects in the Eighth Plan. That would be like the old argument of the sixties in favour of a plan holiday: the answer to that argument is simple, namely, that it cannot be done. The very fact that these are long-gestation projects means that early starts are needed; the uncertainties in regard to costs and benefits and the difficulties of control over the projects are not arguments in favour of abandoning planning, but merely call for greater and more concerted efforts.

Another argument relates to the rate of investment per hectare of irrigation potential created, which has been going up. It was Rs 1,530 in the First Plan period and has been reckoned at Rs 39,330 for the Seventh Plan period. (The latter figure has been arrived at with reference to the likely actual outlay of around Rs 11,800 crore on major and medium irrigation projects and the irrigation potential of 3 million hectares actually expected to be added during the Seventh Plan period.) The figures are somewhat misleading because we cannot really compare First Plan figures and Seventh Plan figures without an adjustment for price-level changes. Moreover, there is also a time-lag problem: some of the expenditure incurred during a plan period may fructify into irrigation potential in the next plan period. (But of course, the time-lag factor applies at both the commencement and the conclusion of the plan period, and so perhaps it may not significantly affect the calculations.) To get out of these difficulties, it has been suggested that the investment per hectare of irrigation potential should be determined with reference to individual projects recently cleared by the TAC. One calculation is that this would be Rs 22,600. However, this too may not be dependable because the completion costs of the projects might turn out very much higher than the costs approved by the TAC, and the irrigation potential created might turn out to be less. On the other hand, if we try to calculate the cost with reference to a few *completed* projects, we will run into the difficulty that these projects must have commenced several years ago, and that a substantial part of the investment in these projects relates to past years and will not reflect current costs.

If we ignore all these complications, refrain from making comparisons between different plan periods, and go merely by the Seventh Plan provision of Rs 11,555.56 crore and the projected creation of additional irrigation potential or 4.3 million hectares, we get a figure of Rs 26,874 as the investment per hectare of irrigation potential. To this we have to add a figure, say Rs 2,000 or so (this is purely guesswork), to make up for the likely under-provisioning of environmental and rehabilitation costs; and a further figure of Rs 2,500 to Rs 3000 to cover investments on CAD works, etc, to ensure the utilisation of the water made available. We then get a rough-and-ready figure of around Rs 32,000 per hectare. As against this, the Seventh Plan provides an outlay of Rs 2,804.99 crore on minor irrigation; if we add the projected institutional investment of Rs 3,500 crore, we get a total of Rs 6,304.99 crore. This was expected to create an additional potential of 8.6 million hectares. This gives an investment of Rs 7,331.38 per hectare. Whatever the methodological questions and the adjustments needed, it seems abundantly clear that the investment per hectare of irrigation potential created by a major irrigation project is a multiple (fourfold or more) of the figure under minor irrigation projects.

VII

Major versus Minor Irrigation

It is in this context that the advocacy of a shift of emphasis to minor irrigation acquires plausibility. An economic comparison of the two is of course not very simple. In the first place we may have to make some addition to the investment cost under minor irrigation to cover elements which it does not take into account. Secondly, the cost of operation (energy for pumping, etc) may be much higher in the case of minor irrigation, and there may be need for capital repairs or renewals and replacements every few years. (Assets created under major irrigation projects have a much longer life.) These are matters for detailed calculations. (The Central Water Commission believes that in

with the large projects.) The more important point is that, as we have seen earlier, the use of surface water and that of groundwater cannot be considered in isolation from each other.

However, without attempting an economic comparison between major and minor irrigation, it has to be conceded that there are some practical advantages in the latter. In a capital-scarce situation, where the resources to undertake and complete large projects are not easy to find, we may necessarily have to give some preference to options which call for limited investments. Further, we have a much greater control over small projects. These are not plagued by time and cost over-runs. The area covered is limited and so there should be no time-lag in utilisation; the gap between potential created and potential utilised is essentially a problem relating to major irrigation projects (though it has begun to make its appearance in the case of minor irrigation also). The question of a conflict between head-reached farmers and tail-enders is also one which does not arise in the case of minor irrigation. Minor irrigation is also unlikely to create problems of waterlogging and salinity. As the farmer ultimately bears both the capital and the operating costs under minor irrigation (though with some subsidisation), water-use is likely to be much more careful and economical than under major irrigation. Lastly, major irrigation projects have a long gestation period whereas minor irrigation yields immediate returns. In view of these considerations there is certainly a case for a much greater emphasis being placed on minor irrigation, and for being more selective about major irrigation, though this does not mean a ruling out of major projects. In fact we need a change of names: the terminology of 'major' and 'minor' carries an unintended implication of a ranking of the two kinds of irrigation. It is necessary to remember that what we call 'minor irrigation' is minor only in respect of area covered and not minor in importance.

VIII

Projects to be Multi-Purpose

Finally, considering the heavy investments, long-gestation periods and the human, social and environmental problems involved in large-dam projects, it stands to reason that every possible benefit should be extracted from such projects; in other words, they should be multi-purpose projects. Each such project should provide for drinking water, irrigation, industrial use, the generation of hydro-electric power and flood control (if the river is prone to floods), and the reservoir should also be used for fisheries development. Additional investments (power station and distribution network, water supply systems, cold storage and transportation facilities, etc) would of course be needed for the actual realisation of some of these benefits. Some of these investments may be a part of the project from the beginning, and others may be made later and may be separate projects, but the water-resource project should be conceived of as a composite one from the start. The economics of that project would undoubtedly be greatly enhanced by such an approach. (Needless to say, each such project should be conceived of, not as an isolated project, but as one component in an overall plan for the development of the basin as a whole.)

IX

Conclusion

The purpose of undertaking this rather protracted examination was not merely an academic clarification of issues but also a practical one of deriving guidance for policy and action. The results of this analysis can be set forth as follows.

We cannot, on environmental grounds, say 'No' to large dams and reservoirs; nor can we, having regard to projections of demand and availability, accept the view that there is no need for such projects. We should certainly accord priority to the utilisation of the potential already created, the reclamation of the potential which has been lost through misuse, and a vast improvement in water management (including both economy in use and recycling). We must encourage extensive local water-harvesting, and undertake re-greening and other measures to retard the rate of run-off and improve the retention of water in the ground. We should also place a much greater emphasis than in the past on minor irrigation, which calls for less immediate investment, promises quicker results, and presents fewer problems. Possibilities such as the use of sea water and the tapping of deep underground aquifers also need to be examined. However, we cannot rule out investment in at least some large-dam projects. Large and small projects, and the use of surface water and groundwater, have to be integral parts of an overall plan of land-use and water-use for a drainage basin or watercourse system as a whole. At the same time, considering the heavy costs (financial, human, social and environmental) involved in large-dam projects, we have to be highly selective and extremely cautious regarding approvals to such projects. First, there should be an elimination of sites which are totally unacceptable from the environmental or socio-economic points of view. In respect of other locations, strenuous efforts need to be made for a comprehensive and rigorous techno-socio-economic appraisal of large-dam projects, despite the methodological, institutional and political difficulties involved. All available options for a given situation should be examined. Major water-resource projects involving large dams should be considered acceptable only if they represent the optimal answers to the needs of the area. Each such project should be planned from the beginning as a composite multi-purpose project

(covering irrigation, hydro-power, dri
water, industrial use, fisheries developm
etc) within an overall development pla
the basin. The clearance of such pro
should be conditional not merely on
passing a thoroughgoing scrutiny, but
on the benefits significantly exceeding
costs. Stringent conditions, particularl
regard to the human and environme
aspects, will have to be attached to
clearance, and there should be a machi
armed with adequate powers to enforce
conditions. This will be difficult but it is
only way in which the dangers inheren
such investment decisions can be mini
ed and the projected benefits realised.

Some of the elements in that statem
may seem familiar; they may be found
writings and speeches which advocate
ferent (and partial) points of view. The m
of the present contribution, if it has
must lie in the openness of mind it stri
to bring to bear on the subject; the rout
patient examination through which it se
to reach its results; and the effort it ma
(with whatever measure of success) at co
pleteness of statement. The result may ple
neither the environmentalists (or so
among them) who would strongly argue
a simple 'No' to such projects, nor
engineers who may fear that the con
tionalities proposed would be so string
as to be virtually negative; but alas, in t
as in many other matters the truth is diffic
and complex and does not lend itself
simplification.

Major and Minor Irrigation Works

Cost Aspects of the Controversy

B D Dhawan

It is inappropriate to derive investment norms for irrigation, plan-wise and category-wise, from plan statistics on outlays and irrigation potential. Such norms for minor irrigation works are inherently underestimated. Their comparison with the corresponding norms for major and medium irrigation works give a misleading picture that minor irrigation is a less capital-using option for the Indian economy. Not only the capital saving argument but also the recurring costs argument appears to be tilted against minor irrigation. Thus the case for according priority to minor irrigation development in Indian water planning on grounds of cost economy is not well founded in facts.

INTRODUCTION

BY nature water is a very complex resource. As and when its complexities are ignored, or simplified, by the critics of water planning, controversies can easily crop up. In view of the heightened public interest in this vital resource some of these controversies can spill over to public fora like the daily press, weekly magazines and parliament. Given the ample scope for misunderstanding[1] of crucial aspects of this resource, non-issues can become issues of great concern and attention.

By and large, the controversial issue of promoting minor or major irrigation works—a variant of this issue is groundwater against surface water irrigation—is a non-issue. This is for two solid reasons. First, our water endowment is not that bountiful as is often portrayed by many public-spirited persons. Even on full development of all our ultimate irrigation potential, we are not likely to extend the benefit of irrigation to more than 60 per cent of our crop land—this percentage is likely to be around 35 for extremely water-short regions like the Deccan plateau, Gujarat and Rajasthan states of western India. Thus we cannot afford to neglect any of our water resources, half of which are in the form of major and medium works category.

The second weighty consideration emanates from a hydrological standpoint. Hydrologically speaking, both groundwater and surface water are inter-linked resources.[2] It is mainly due to such inter-linkage that water planners plead for development of a conjunctive irrigation system, thereby precluding exclusive emphasis on either surface or groundwater irrigation.

In view of the foregoing perception it does not appear to be a matter of great relevance to investigate which of the two options, namely, major and minor irrigation, would prove a better proposition in terms of cost-benefit framework. Given the difficulty of resolving the question of comparative costs and comparative returns, one must be wary of all simplistic propositions in this regard. The pitfalls in comparing costs alone of the two categories of irrigation, let alone their comparative augmentation in farm production, are dealt with in what follows. It is hoped that this will go a long way in exploding the myth about minor irrigation, unlike major irrigation, being deemed as a low-cost proposition for the Indian economy. In a way, the author is carrying forward the story of his short paper,[3] in which he conjectured as follows:[4]

> If costing of the two sources of irrigation is appropriately carried out, surface irrigation works may score decisively over well irrigation, possibly by a margin of 3:2.

The outline of the paper is as follows. To begin with, we briefly describe the criteria for categorising irrigation works in Indian planning. Next we look at the cost structure of irrigation. This is to emphasise the need for probing the cost issue both from capital and recurring cost angle, as the comparisons done by some writers solely or the basis of capital costs unfairly show major irrigation works in a poor light. This kind of partial comparison of the two categories of works is still further tilted against major irrigation as the available estimates of unit capital cost are found to be deficient on three counts. The drawbacks of the available estimates, derived mostly from five-year plan reports, are duly highlighted. This is followed by drawing attention to the weakness of the much-talked about capital saving argument in favour of minor irrigation development. Towards the end, we bring out the substantial advantage in respect of recurring costs in promoting major over minor irrigation in India.

Since neither our estimates of unit capital cost nor our estimates of operational costs of major and minor irrigation works are very firmly established, we are desisting from indicating the extent to which the overall cost advantage lies in favour of major instead of minor irrigation works. Whosoever is eager to do so must use not only firm estimates of capital and operational costs but also carry out the exercise in terms of social costs. While doing so, one must duly reckon with two aspects of investment costs of major irrigation works, namely, (i) the true cost of land (including forest cover) submerged by reservoirs and (2) the rent-seeking elements (i e, kickbacks and fictitious expenditure) in costs of major irrigation projects. While the true cost of land submergence is likely to be far more than the nominal figures shown in project records, the exclusion of rent-seeking costs will substantially bring down the true resource cost of the major irrigation projects.

CATEGORIES OF IRRIGATION WORKS

Irrigation works can be distinguished in more than one way. For our purpose here it would suffice to note that categorisation of irrigation works in Indian planning is mainly on the basis of irrigation capacity of a work, mentioned as irrigation potential in our plan documents. (Prior to the Fifth Five-Year Plan, investment outlay needed for executing an irrigation work was the criterion of categorisation.) When the crop area to be irrigated from a given scheme is 2,000 hectares or less, the scheme is treated as a minor irrigation work. It is when the irrigated acreage exceeds the limit of 10,000 ha that the irrigation work is characterised as major work. For a scheme designed to irrigate between 2,000 and 10,000 ha there is the third category of medium irrigation works. Schemes under the third category being few, these are usually clubbed with the category of major irrigation works. And all groundwater-based schemes are invariably included in the minor irrigation category.

Leaving aside for the moment the limitations of plan statistics with regard to major and minor irrigation potential, the aggregate irrigation capacity of all minor irrigation works is of the order of 40 million ha as compared to about 30 million ha under major (and medium) irrigation works. Thus the minor irrigation segment of the Indian irrigation sector is bigger than the major irrigation segment by a factor of one-third.[5]

Within minor irrigation segment, dugwells and tubewells dominate, accounting for almost three-fourths of the capacity of this segment. In fact, most of the additions to minor irrigation capacity since 1951 are from groundwater sources.

COST STRUCTURE OF IRRIGATION

For any productive activity, two types of costs are entailed. One is the capital cost, and the other is the operational cost. Capital costs arise in the construction phase, whereas operational costs are incurred after the construction phase is over. It is now well recognised that modern irrigation works are highly capital-using. In view of this, project cost comparisons are often made in terms of unit capital costs of various irrigation projects. That is to say, irrigation projects are compared on the basis of their construc-

tion costs (including pre-investment investigational outlays) per unit area to be irrigated by them on full development. This way of looking at comparative project costs appears quite all right for major irrigation works whose annual operational costs (including repair and maintenance costs) per unit area to be irrigated are extremely small. According to the Eighth Finance Commission of India, the operational costs for major irrigation works for 1981-82, when divided by area benefited by these works, would amount to about Rs 92 per irrigated hectare.

Evidently, it is inappropriate to compare two irrigation projects on the basis of unit capital cost only if their cost structures are substantially at variance with each other. This is precisely the position when it comes to comparing major with minor irrigation works. It is a well known fact that operational costs *vis-a-vis* capital costs are of far greater significance for minor than for major irrigation works. Given this structural difference in costs, cost comparison based on capital costs alone can put minor irrigation in a questionable advantage over major irrigation. And matters can become truly worse if the estimates of unit capital cost of the two categories of irrigation are highly deficient, the deficiency being such as to tilt the balance in favour of minor irrigation, as shown below.

Drawbacks in Available Estimates

Nowhere in the five-year plan reports one comes across concrete figures of unit capital requirements for irrigation works of either category. Therefore, one must be wary of any such estimates that may be quoted by minor irrigation lobbyists in support of their contention. The cited figures, category-wise or plan-wise, are usually the handiwork of analysts who try to grind them out from the following two sets of statistics listed in the plan documents:

(1) actual or anticipated outlays for major and minor irrigation works for each plan period; (2) planners' own estimates of irrigation potential created, or anticipated to be created, in each plan period for each category of irrigation.

In what follows we bring out how faulty estimates of unit capital cost can be generated when plan outlays are divided by corresponding estimates of irrigation potential. To begin with, the plan statistics on outlays for minor irrigation do not give a full picture of capital resources required for developing minor irrigation capacity in the country. The reported outlays are for the public sector only, thereby leaving out investments on private account. In other words, the play outlays for minor irrigation works are not inclusive of farmers' own investments in tubewells, dugwells, pumpsets etc. Since the plan statistics on minor irrigation potential are for the entire minor irrigation segment (i e, both on public and private account), the collation of the area and outlays data given in the plan documents gives rise to seriously underestimated figures of unit capital requirements of minor irrigation unless the user of these plan statistics makes suitable adjustments for the omitted investments on private account. Needless to say, a similar collation for major and medium irrigation works yields an estimate of unit capital cost which is free from the element of underestimation as the major and medium irrigation schemes are envisaged entirely for the public sector.

Secondly, there is some lack of compatibility between outlays on irrigation in a given plan period and the resultant addition to irrigation capacity in the same plan period. It is well known that the gestation period for a major irrigation project is about 10 to 12 years under efficient conditions of implementation, and 20 to 25 years under inefficient conditions of implementation. As irrigation capacity of an ongoing project is not created in direct proportion to investment expenditures in a given plan, a lack of correspondence between plan outlays and created irrigation potential can exist for a given plan period. This can distort the estimate of unit capital cost, the distortion being more serious in the case of major than minor irrigation works like wells which can be usually constructed within a single year.

The third limitation of the plan outlays on irrigation arises from the fact that some of these are not meant to result in any addition to irrigation capacity. For instance, outlays on (1) research and investigation organisations like the Central Water Commission and the Central Groundwater Board, (2) remodelling of headworks, lining of channels and strengthening of drainage in old irrigation and (3) replacement of old works[6] that have outlived their useful lives, are not envisaged to enhance irrigation capacity as such. Instead, these are meant more to improve the productivity of the irrigation system as such. Evidently, such outlays unduly raise the derived figures of unit capital costs, the rise being obviously higher for major works.

The foregoing exposition of the principal drawbacks of the plan data on irrigation sector clearly brings out that the estimates of unit capital cost for irrigation works, when derived from such data, can be quite erroneous. Such derived estimates, as we shall demonstrate presently, could be grossly understated in respect of minor irrigation works—especially for wells and tubewells—and considerably overstated for major and medium irrigation works. Evidently, inferences based on a comparative analysis of such unit capital cost estimates for various irrigation works cannot be accepted without reservation. In his recent book, J S Kanwar, basing himself on such faulty estimates, erroneously observes that the 'costs of groundwater development are hardly one-fourth of surface water development in the Seventh Plan'.[7] Likewise, in another recent study by the secretariat of the Afro-Asian Rural Reconstruction Organisation, the following inference is drawn for the entire period of Indian planning:

> The investment cost of unit irrigated area for major and medium irrigation projects was 118 per cent more than for minor irrigation.[8]

For the benefit of the curious reader, we give in the table the estimates derived by P Sachidanandan and B P C Sinha for major and minor irrigation works for various plan periods.[9] Mainly owing to the persistence of price inflation throughout the period of planning, unit investment costs for all categories of irrigation works have shown a strong upward rise, notably since the Third Five-Year Plan period. During the fifties this rise was rather of a modest magnitude in the category of major and medium irrigation works, but very steep in the category of minor irrigation works (see the table). As a result of this, the Second Plan figure for unit cost for minor irrigation works came to exceed the corresponding figure for major and medium irrigation works. Our contention is that this startling result has arisen largely because of serious underestimation in the estimated outlay figure for minor irrigation for the First Plan period.

Institutional finance has played a noteworthy supporting role in the development of minor irrigation. Over time, its share in total investment funds used for minor irrigation works has risen steadily, though firm estimates in this regard are not available. This is inferred from two empirical facts. First, investments in Indian agriculture are being increasingly financed by the commercial and the co-operative banks. According to M V Gadgil, institutional finance, which accounted for 29 per cent of private capital formation in Indian agriculture in 1973-74, constituted about 43 per cent of capital formation during 1982-83.[10] Second, much of this institutional finance has been used for minor irrigation purpose. According to S S Sangwan, the per cent share of such finance was 42 in 1969, 80 in 1975, 63 in 1981 and 49 in 1985.[11] In view of these facts, one may say that the degree of underestimation in investment outlays for minor irrigation ought to diminish as we move from First to the Seventh Plan.

Questionable Capital Saving Argument

In a capital-short economy like ours it is a very appealing thing to commend to planners options which appear least capital using. In this context, we must reckon with two things, namely, (1) the supporting investments required for each option and (2) the replacement time after which fresh investment is required for each option. Let us, therefore, look at these aspects of major and minor irrigation options, so as to ascertain which option may strain our capital resources less in the long run. In my assessment, the capital saving argument, contrary to the general impression, is more tilted in favour of major than minor irrigation.

Generally speaking, the useful life of major irrigation works is reckoned at 100 years, after which the civil structures of the canal network need to be reconstructed. As far as the dam is concerned, its life is governed mainly by the number of years it would take to get the 'dead' storage of the reservoir to fill up with silt and debris brought by water flowing into the reservoir. It is widely agreed that the rate at which reservoir siltation is occurring in India is much higher than the rate assumed by dam designers. Even then, reservoirs are expected to serve useful purpose for 100 years or thereabouts. So, the need for replacement investment in the case of major irrigation works is anticipated to materialise largely after 100 years. This is far in excess of the corresponding period for minor irrigation works, especially tubewells which are expected to last for 20 years or so under good maintenance conditions. Likewise, pumpsets fitted on open wells need replacement investment in 15-20 years time. It is only the investment embedded in dugwell proper that requires replacement after a much longer time, say, about 50 years in the case of masonry wells located in alluvial soils and 100 years or more for dugwells in hard rock regions.

Major and medium works use the natural force of gravity in their operation, while groundwater and minor surface water lift schemes need energy for countering the pull of gravity. Thus supporting investments in the energy sector are minimal for major and medium works but quite substantial for minor irrigation. In particular, electric pumpsets/tubewells need requisite investment in power generation equipment and rural electrification system. An average pumpset in India required about 4 KW of power during the mid-seventies when each KW of generating capacity cost nearly Rs 3,000 in capital outlay alone.

It is not known how much is the capital cost borne by the nation while meeting the energy needs of an agricultural pumpset. Nor do we have firm estimates of such supporting investment needed for each unit area of irrigation potential established through minor irrigation works. But some idea about the relative dimension of such costs *vis-a-vis* the plan outlays on minor irrigation can be formed by adopting the following procedure, which we apply to the Fifth Five-Year Plan data. To begin with, we estimate that portion of the plan outlay on power generation as can be attributed to 0.870 million electric pumpsets added during the same plan period. To this we add the specific plan outlay earmarked for rural electrification. Finally, we estimate the investment in minor irrigation on farmers' own account. Adding these three costs on capital account to the direct capital outlay reported for minor irrigation, we obtain total investment needs of the minor irrigation segment, which on division by the corresponding addition to minor irrigation potential yields the estimate of total investment cost per unit area for minor irrigation works.

Assuming (1) each electric pumpset requires 4 KW capacity at the power generating point and (2) each KW capacity was established at Rs 3,500 during the 5th Plan, the plan outlay for power generation for 0.870 million electric pumpsets would amount to about Rs 12,180 million. To this may be added Rs 8,420 million on account of expenditure on rural electrification programme during the Fifth Plan, making a total of Rs 20,600 millon on account of supporting investment in power for electric pumpsets.[12]

As against the supporting, or indirect, investments of the order of Rs 20,600 million on account of electric pumpsets, the Fifth Plan figure of direct investment in minor irrigation is considerably lower, namely, Rs 14,110 million. As pointed out earlier, this figure is exclusive of investment on farmers' own account. The reported break up of this figure is as follows: (i) contribution of the state governments Rs 6,310 million (ii) financing from institutional funds Rs 7,800 million.

If we make an assumption that farmers' own funds amounted to just *one-fifth*[13] of the total direct investments in minor irrigation, the farmers' share would be around Rs 3,528 million. Thus aggregate direct outlays on minor irrigation for Fifth Plan add up to nearly Rs 17,638 million, still less than the corresponding indirect outlay of Rs 20,600 million on account of electric pumpsets. The sum of these direct and indirect outlays comes to about Rs 38 billion, which on division by 3.8 million ha of minor irrigation potential added during the Fifth Plan yields an estimates of nearly Rs 10,000 per ha. This reestimated unit capital cost is well above the corresponding estimate of nearly Rs 6,000 per ha for major and medium irrigation works (*vide* the table).

Differential in Operational Costs

The weakness of the assertion that, hectare for hectare, minor irrigation requires a fraction of the capital resources needed for developing major irrigation works has been demonstrated in the preceding analysis. In all probability, establishment of major irrigation projects may prove a much less capital using proposition for the economy as a whole. In what follows an attempt has been made to quantify the advantage in recurring costs in promoting major over minor irrigation schemes. What is being attempted here is an all-India picture of recurring as well as one-shot costs of the two broad categories of irrigation works. It is very likely that the differential in costs varies considerably across regions of this country of continental diversity.

The estimational details, alongwith the sources of data and their limitations, are not being enumerated here in the text but are being relegated to an appendix note. Here, two observations would suffice for a discerning reader. First, the operational costs are strictly recurring costs, thereby excluding both the depreciation charges as well as the interest charge on investment cost. Second, an attempt has been made to work out the recurring cost in resource use terms. While we have tried to keep out the elements of taxes and subsidies, no attempt has been made to shadow price the inputs. Thus, the cost of electricity used in wells equipped with electric pumpsets (now the most prevalent mode of groundwater irrigation in the country) is reckoned at the resource cost of supplying it to rural areas. That is, we value electricity neither at its opportunity cost elsewhere in the economy, nor at the highly-subsidised rates actually paid by farmers.[14]

Obtaining estimates of recurring costs for major and medium irrigation works is a comparatively simple task as the comptroller and auditor general of India compiles financial accounts of public irrigation works in one consolidated form. On the other hand, it entails considerable effort in estimational work for minor irrigation works, which are largely owned by individual farmers. We

Table 1: Unit Investment Figures for Irrigation by Type of Irrigation and by Phase of Indian Planning

S No	Planning Phase	Major and Medium Irrigation Works	Minor Irrigation Works (A)	Minor Irrigation Works (B)
1	First Five-Year Plan (1951-56)	1,520	550	655
2	Second Plan (1956-61)	1,810	2,300	2,210
3	Third Plan (1961-66)	2,640	2,010	1,990
4	Annual Plans (1966-69)	5,900 (2,890)	2,810	2,820
5	Fourth Plan (1969-74)	4,760	2,610	2,610
6	Fifth Plan (1974-78)	6,110	2,710 (3,710)	3,670
7	Annual Plans (1978-80)	10,820	4,120 (3,620)	3,660
8	Sixth Plan (1980-85)	19,310	4,520	4,390
9	Seventh Plan (1985-90)	26,870	7,830 (7,330)	NA

Notes: (1) For major and medium works as well as minor works (estimate A), the data are from Sachidanandan's paper. Some discrepancies were noticed. So the correct figures, as derived from his data on expenditure and irrigation potential given in Table 1 (p 80), are shown in brackets.

(2) The estimate B for minor works is derived by the author from Sinha's relevant data in Table 6 (p 140). For Sixth Plan, the estimate is based on provisional data.

Source: Papers by P Sachidanandan and B P C Sinha in J S Kanwar's book.

have attempted the exercise for the beginning of the eighties only. Needless to say, there is ample room for improving the estimational work.

Our estimate for major and medium irrigation works comes out to nearly Rs 60 per irrigated hectare. This is way below the corresponding estimate of recurring expenditure for groundwater irrigation, which ranges between Rs 637 and Rs 849 per irrigated hectare. Thus there emerges a differential of almost 1:10 between major and minor works, that is, major irrigation is one-tenth less resource using in respect of recurring costs.

Conclusions

It is inappropriate to derive investment norms for irrigation, plan-wise and category-wise, from plan statistics on outlays and irrigation potential. Such norms for minor irrigation works are inherently under-estimated. Their comparison with the corresponding norms for major and medium irrigation works give a misleading picture that minor irrigation is a less capital using option for the Indian economy. Not only the capital saving argument but also the recurring costs argument appears to be tilted against minor irrigation. Thus the case for according priority to minor irrigation development in Indian water planning on grounds of cost economy is not well founded in facts.

Appendix

Estimates of Recurring Costs of Irrigation

In this note we spell out the details behind our estimates of recurring costs of major and minor irrigation per irrigated hectare for the beginning of the eighties. There is considerable room for firming up these estimates, especially the one for minor irrigation. Despite the infirmities, we do hope these numbers do provide a fair picture of the differential in recurring costs between the two categories of irrigation works.

Sources of Data and Their Limitations

The annual reports of the state irrigation departments are the principal source of information with regard to operational expenses of major irrigation works. The audited accounts of these reports are published by the comptroller and auditor general of India in its annual publication entitled *Combined Finance and Revenue Accounts of the Union and State Governments of India*. Accounts of major and medium irrigation works figure in two sets of tables, namely (a) Account No 101 for multipurpose river valley projects like Bhakra and Nagarjunasagar, and (b) Account No 102 for irrigation, navigation, drainage and flood control projects. While the data in respect of irrigation is separately listed in Account No 102 (and its sub-accounts), it is not so with the other account. Expenditure on two items, namely, maintenance and administration, is being deemed by us to be the operational cost of major irrigation works.

For getting at the operational costs of minor irrigation, one has to carry out an estimational exercise. The task is not difficult because we have adequate data base for the purpose. First, we have the published records on electricity consumed by the Indian agricultural sector. Since the resource cost of supplying electricity can be computed from the records of the state electricity boards, we can make a reasonable estimate of operational cost of well irrigation due to the use of electricity. Second, we have published records on the number of waterlifting devices by category of motive power, namely, electric pumpsets and diesel pumpsets. By adopting a suitable norm for petroleum oil consumption per diesel pump per year, one can figure out consumption of diesel oil for well irrigation purpose, and this consumption can be valued at appropriate price of diesel oil. Third, repair and maintenance cost of pumpsets can be figured out by first adopting an investment norm per pumpset, and next applying the norm that repair and maintenance expenditure amounts to some 5 to 10 per cent of the cost of a pumpset. Fourth, operational costs for wells equipped with traditional waterlifts may be assessed with the help of estimates based on sample survey reports prepared by scholars/agencies who have studied the comparative economics of traditional and modern wells.

A word about the data source on irrigated area is necessary. We are using the data on utilised irrigation potential given in five-year plan reports, and not from the land use statistics compiled by the state revenue departments and finally published by the central ministry of agriculture. The problem with the latter source, which is usually used by scholars of Indian agriculture, is that category-wise statistics of irrigated area are in 'net' terms, and not gross terms. Without making assumptions about intensities of irrigation for major and medium irrigation works on the one hand and minor works on the other, it is not possible to convert net irrigated area into its corresponding gross irrigated area. Fortunately, the plan statistics of irrigation potential are on gross area basis.

Operational Cost of Major Irrigation

The operational expenditure for the multipurpose river projects amounted to about Rs 279 million during 1980-81. In respect of major and medium irrigation projects the same totalled around Rs 1,083 million. Thus overall operational costs of canal irrigation may be reckoned at Rs 1,362 million, of which Rs 530 million was accounted by establishment cost alone. The maintenance and repair expenditure stood at about Rs 844 million, just about 15 per cent below the revenue income (Rs 986 million) from the canal system in 1980-81. Adopting a figure of 23 million hectare for area actually irrigated by major and medium works in 1980-81, one obtains an approximate estimate of Rs 60/ha as operational cost for canal irrigation.

Operational Cost of Well Irrigation

There were about 4 million electric pumpsets at the beginning of the financial year 1980-81. Indian agriculture reportedly absorbed in this year about 14,489 million KWH. These statistics imply an annual consumption of about 3620 KWH per electric pumpset, which is about one-fifth higher than the norm of 3000 KWH per electric pumpset used by the Working Group of Energy Policy in its report of 1979. Assuming that some of the electricity was used for purposes other than pumping of groundwater, we are envisaging that about 13,000 million KWH was used for groundwater pumping. Though farmers usually paid 15 to 20 paise per KWH, the resource cost of power generation and rural electrification in 1980-81 may be placed in the range 60 to 80 paise per KWH.[15] Thus, cost on account of electricity comes in the range of Rs 7,800-10,400 million.

Diesel oil used in agriculture, as per the national income accounts of 1980-81, amounted to about Rs 24,788 million at current prices. This was used by over 2.6 million diesel pumpsets, nearly 0.3 million tractors, an unknown number of harvest combines and threshers. The Working Group on Energy Policy (1979) adopted a norm of 0.8 tons per diesel pumpset. (We believe that this is on the high side, as it is derived on the principle of energy equivalence for 3000 KWH for an electric pumpset.) If we follow this norm and assume a price of Rs 2,200 per ton for diesel oil, the energy cost for diesel irrigation pumps may be placed at Rs 4,576 million for 1980-81. But if we adopt a lower norm, say 0.6 tons per diesel pumpset, the cost for 2.6 million diesel pumpsets would be Rs 3,432 million. Thus we get a range sestimate of Rs 3,432-4,576 million for diesel consumption by diesel pumpsets for 1980-81.

Thus the expenditure on account of electricity and diesel oil fell in the range Rs 11,232-14,976 million, which, when divided by a groundwater irrigation potential of 23 million ha for 1980-81, yields a range estimate of Rs 488-651 per ha. To this may be added a notional repair and preventive maintenance cost of Rs 49-98 per ha by making two assumptions, namely, (1) the investment cost per pumpset in 1980-81 was Rs 3,500 and (2) the repair and maintenance cost ranged between 5 and 10 per cent of the investment in pumpset. Therefore, the operational cost on account of pumpsets alone ranged between Rs 537 and Rs 749 per irrigated hectare. To this have to be added two more costs, namely, (i) cost of operating traditional wells and (2) repair and maintenance of dugwells and tubewell borings.

There were about 7.8 million dugwells and nearly 2.2 million tubewells in existence at the beginning of 1980-81. If 6.5 million pumpsets were used in 2.2 million tubewells and 4.3 million dugwells, 3.5 dugwells are presumed to be operated by traditional waterlifts. Since many of the dugwells fell into disuse as their owners acquired tubewells, we may say about 2.3 million dugwells were used with traditional waterlifts. We are adopting a figure of Rs 1,000 per traditional waterlift.[16] With this, the average operational cost per hectare for well irrigation stood somewhere between Rs 637 and Rs 849 during 1980-81.

Notes

1 Even for a country like the US, Charles Howe is constrained to remark in his book *Natural Resource Economics* (Wiley, 1979) that water among the natural resources is most misunderstood.

2 Some hydrologists consider the interlinkage so close that they refuse to consider groundwater and surface water as separate entities.

3 B D Dhawan, 'Water Resource Development: Groundwater versus Surface Irrigation', *Journal of Indian Water Resources Society*, Volume 8, No 1, January 1988, pp 49-52.

4 Also, it was hypothesised that the cost advantage of surface irrigation works is wholly offset by the disadvantage on the benefits side. That is, neither groundwater nor surface water irrigation is a cost-effective option, and thus need not be specifically promoted on grounds of costs and returns.

5 B B Vohra, a proponent of the minor irrigation cause, is unduly dramatising by writing under the banner 'Minor becomes Major'. In point of fact, such a differential between the two segments has prevailed since long, e g, the same differential is noticeable in 1950-51, the pre-plan date.

6 A sum of Rs 8,000 million is to be spent as replacement investment on the Ganges Canal System (west UP) whose major civil works (between Roorkee and Haridwar) are now more than 125 years old. The World Bank is financing this scheme. Likewise, Rs 2,000 million is the replacement investment needed for the Sone Canal of south Bihar.

8 Source: 'Role of Irrigation in Development of Agriculture in Developing Countries', *Rural Reconstruction*, Volume 20, No 1, January 1987, p 82. See also the subsequent issue of this journal.

9 It may be pointed out here that separate plan outlays for groundwater development are not listed in the plan documents. It is by assuming groundwater development to be synonymous with minor irrigation development that writers like J S Kanwar and B B Vohra argue about groundwater being more cost-effective than surface irrigation in India.

10 M V Gadgil, 'Agricultural Credit in India: A Review of Performance and Policies', *Indian Journal of Agricultural Economics*, Vol 42, No 3, Conference Number, Part I, July-September 1986, p 293.

11 S S Sangwan, 'Agricultural Investment and Regional Imbalances: A Study of Refinance Disbursed by NABARD', *Indian Journal of Agricultural Economics*, Vol 42, No 3, Conference Number, Part II, July-September, 1986, p 567.

12 Admittedly, there is overestimation here because of our tacit assumption that the generating capacity of 4 KW and the rural electrification system are wholly and exclusively for electric pumpsets. But then, we are also not reckoning with supporting investments for diesel pumpsets.

13 The Working Group for Sixth Plan assumed that 35 per cent of the outlay on private wells would be financed by farmers themselves (p 17). But if we reckon with total investments of minor irrigation, the share of private investment is Rs 1,000 crore out of Rs 4,850 crore, i e, about one-fifth.

14 For a 5 HP pumpset, the price realised by the public utilities is estimated to vary widely from state to state. It is about Rs 0.15 per KWH in Kerala, MP and Maharashtra; between Rs 0.10 and Rs 0.15 per KWH in Andhra Pradesh, Jammu and Kashmir, Karnataka, Punjab and Tamil Nadu; between Rs 0.15 and Rs 0.25 per KWH in HP, Orissa, Rajasthan, Chandigarh, Delhi, and Pondicherry; between Rs 0.25 and Rs 0.35 per KWH in Assam, Haryana, Meghalaya, West Bengal and Tripura; and between Rs 0.35 and Rs 0.45 in Bihar, Gujarat and UP (Central Electricity Authority, *Average Electric Rates and Duties in India*, 1986, p 15.)

15 For Uttar Pradesh, Rajadhyaksha Committee on Power (1980) found that resource cost of supplying electricity to rural areas during 1978-79 amounted to about 67 paise/KWH as against the average cost of 44 paise for all LT consumers.

16 That our figure of Rs 1,000 is not unduly high is sustained by the following comparative picture of operational costs for different waterlifts for west UP for 1984-85.

Rope and bucket lift ('mhot')	= Rs 2331
Counterpoise lift	= Rs 963
Persian wheel	= Rs 2494
Diesel pumpset TW	= Rs 3335 - 5322
Electric TW	= Rs 1561 - 2202

Statement of the Chairman, Mr. N. A. Palkhivala

(53rd Annual General Meeting at the Birla Matushri Sabhagar, 19, Sir Vithaldas Thackersey Marg, Bombay-400 020, on Thursday, September 28, 1989)

“After four decades of strangulating controls, total decontrol has been the most propitious development this year but …. unless cement selling is delicensed, penetration into the rural markets is bound to remain dishearteningly difficult.”

I have to begin on a sad note. Sumant Moolgaokar is no more. He was one of the main builders of your Company, and served the cement industry with rare distinction for 58 years. The fall-out from his dedicated labours was “innovative quantum jumps in India’s technological progression”, as one of your Directors put it.

As an architect of a new undertaking, Sumant was in the world class of the most dynamic entrepreneurs. He combined a creative mind with a high-octane passion for perfection. To him perfection was a goal, never quite reached but always sought after. **He had an eye for the scarcest resource of all – talent; and he could bring out the best in his team. No one worked *under* him: every one worked *with* him. Emperors rule, but leaders motivate. He could motivate the workforce to the pitch where they became emotionally involved in the company they served.**

Integrity and self-effacement came as naturally to him as deviousness and ostentation come to some others. *Business ethics* was not to him an oxymoron – like a hot ice-cube or a tiny giant.

Sumant Moolgaokar loved nature – “the silence that is in the starry sky, the sleep that is among the lonely hills.” He loved birds and trees and the wind upon the heath, and “saw the brightness of the skirts of God”. He felt a mystic kinship with the animate and the inanimate world – in that sense he was in tune with the infinite. Ecology and environment were to him paramount considerations which were non-negotiable. His was, par excellence, a life with a theme, a life dedicated to the great thinker’s ideal –

“To see as far as one may;
To feel the great forces that lie behind every detail;
To hammer out as solid and compact a piece of work as one can;
And to leave it unadvertised.”

We shall endeavour to ensure that your Company will always maintain the high standards that Sumant established. To impove upon them is beyond hope.

Depression in cement industry

After four decades of strangulating controls, total decontrol has been the most propitious development this year for the cement industry. I heartily welcome the long-delayed decision on decontrol for this vital industry which can now organize itself to achieve higher standards in the free market.

However, the year under review has been a year of depression for cement. For the second time in its 53-year history, your Company will not be paying any dividend. A recent study, undertaken by the Cement Manufacturers’ Association (CMA), of 42 companies – accounting for 80 per cent of the total capacity – revealed that the post-tax return on net worth fell sharply from 36 per cent in 1983 to zero in 1987. In 1988 it was a *negative* 12 per cent! The Reserve Bank of India Bulletin of April 1989 gives some startling figures for 1987-88. While the ratio of after-tax profits to net worth was 5.6 per cent for the total industry of India, it was a negative figure for the cement industry. Likewise, the return of post-tax earnings (less preference dividends) on ordinary share capital was 21.2 per cent for the total industry, but was a negative figure for the cement industry.

The reasons for the bad times the industry is going through at present, are not far to seek.

As much as 75 per cent of the input costs of the cement industry is governed by administered prices totally beyond the control of the manufacturers. Decontrol has unfortunately coincided with steep increases in coal prices, electricity charges, and railway freight. With the industry’s output estimated at 49 million tonnes during 1989-90, all the plants taken together will incur an additional expenditure, according to a CMA study, of Rs. 52 crore by way of increase in excise duty, and Rs. 290 crore on account of the hike in freight.

The increase in administered prices and costs has not been compensated by any increase in the retail price of cement. On the contrary, the retail price has fallen over 50 per cent in real terms since the introduction of partial decontrol seven years ago.

The cost increases have come at a time when the industry faces a situation of excess production and cut-throat competition. On a rough reckoning, the supply of cement outstrips demand by four million tonnes.

Widespread industrial sickness is a danger to be guarded against, though the shutting down of some old and unviable units would contribute to a healthy adjustment.

Remedial measures

If we have “an intelligent heart and a kind brain” – the Russian poet’s birthday wish to a little girl – we would have no difficulty in adopting remedial measures which are so obvious that they almost cry aloud for adoption:

***First,* the imperative for the cement industry is to scout for new markets in semi-urban and rural areas where the demand for cement has remained largely untapped.** Cement should be placed outside the purview of the Essential Commodities Act which makes it obligatory for dealers to go through the arduous process of obtaining licences at considerable cost in time and money. Unless cement selling is delicensed, penetration into the rural markets is bound to remain dishearteningly difficult.

Secondly, active measures need to be taken to promote the use of cement for housing. It is a sad commentary on our plans and public policies that, on the one hand, we have a glut of cement and consequent sickness in the industry, while on the other hand we view with equanimity the homelessness of tens of millions of our people as a regular feature of the bleak national landscape. **Recently, the Chairman of the National Housing Bank put the existing housing shortage at 29 million units, and estimated that an additional 36 million housing units will be required to be constructed by the year 2000. In other words, 65 million housing units will have to be constructed over the next twelve years if the shortage is to be met in full.**

Thirdly, the Central and State Governments should implement a priority programme of constructing concrete roads and using cement for the lining of canals for irrigation purposes. International financial agencies have shown an active interest in plans for concretizing our roads. **While the initial cost of concrete roads may be a little higher, (a) the savings in maintenance costs and the longer life of the roads, and (b) the savings in operation costs of plying the ever-increasing number of vehicles, would far outweigh the extra initial outlay. While we mentally accept that roads are the road to national growth, we are content to have the most woefully inadequate system of roads of any comparable country in the world. Only about 1.3 per cent of our surfaced road length is laid out in cement concrete, while – as the Planning Commission's Report recently pointed out – almost one-third of the length of our national highways has only a single-lane road pavement.**

I have no doubt that the depression in the cement industry will not last long. "Even this shall pass away." The governments will be obliged by compelling circumstances to adopt the three remedial measures. The foresight of those who, like your Company, are expanding their capacity, will be fully justified by events.

Exports

While cement was a deficit commodity earlier, it has now the potential to become an earner of precious foreign exchange. The market in our neighbouring countries – Pakistan, Sri Lanka, Bangla Desh and Nepal – is large; and Indian cement, which is of world quality, is readily acceptable in those countries.

But our cost of production is so high that it is impossible for Indian cement to face international competition. Since 75 per cent of the input costs is governed by administered-prices as stated above, there is not much room for reducing the cost of production. The gap between the price of Indian cement and that in the world market is such that Indian producers, to compete successfully, would have to suffer a significant loss of Rs. 400 per tonne. This is hardly the time when the cement industry can bear such a loss. The reliefs offered by the Government on the export front – duty drawback, import replenishment, and ten per cent cash compensation support – are wholly insufficient to neutralize the price differential.

A few of our cement units are strategically located for exports and your Company's reputation attracts numerous international inquiries. But the extent of the loss involved in exports at international prices is a powerful commercial deterrent. Nevertheless, your Company has already ventured into the export market in a modest way.

Modernization and expansion

As I said five years ago, modernization is one of those words which have a resonance wider than their original meaning. To your Company modernization does not mean merely replacement of equipment; it covers upgradation of product and process technologies in their manifold varieties, as also energy conservation.

The completion of the modernization of the plant at Madukkarai, and the optimization schemes at Jamul, Chanda, and Gagal – dealt with in the Directors' Report – augur well for the unfolding future of your Company.

The Government has just cleared our project to increase the present installed capacity of 5.6 lakh tonnes of the plant at Gagal in Himachal Pradesh, by an additional one million tonnes per annum. The project, estimated to cost Rs. 130 crore, will meet the growing demand for cement in the Northern region, specially for the large hydel projects in Himachal Pradesh and in Jammu & Kashmir.

Leader in the field

In the competitive situation today, we are fully geared to stay ahead of the others. In production, our accent is on quality; in distribution, on availability of the product at a fair price.

We strive to live up to the motto – "It is good to be big; it is better to be good; it is best to be both". We shall maintain our premier position in the field; and the good quality of our product is witnessed by the better price it commands in the free market.

Your Company is fortunate in having – under the outstanding leadership of Dr. Subrata Ganguly – a dedicated and loyal family of employees at the works, the offices, and other establishments, who have carried out their tasks devotedly through the difficult times. I should like to express, on your behalf and on behalf of the management, our sense of appreciation and gratitude for their performance in a trying year.

Structure of Effective Incentives in Indian Agriculture

Some Policy Implications

Ashok Gulati

This paper seeks to estimate ·revailing effective incentives for cultivators of different crops in various regions during the 1980s. Section I o ihe paper spells out the methodology adopted and Section II presents estimates of effective incentives for sp.cific crops and regions. The final section draws some policy implications of these results and lists the issues that need further study.

THE present study estimates the structure of effective incentives for Indian cultivators of different crops in various regions during 1980s. More specifically, it calculates four variants of protection coefficients—nominal (NPCs), effective (EPCs), effective subsidy (ESCs) and adjusted nominal (ANPCs), for wheat, rice, cotton and groundnut cultivators. The results have important policy implications such as: that in order to promote an efficient cropping pattern in the country, relative prices be shifted in favour of cotton and rice; that investment programmes to promote long staple cotton in Andhra Pradesh and rice in the eastern states (with high rainfall) have high economic rates of return; that resources and foreign exchange can be saved by increasing production of wheat and rice primarily in line with their domestic demand, and that of cotton in excess of domestic demand, the excess being for exports; and so on.

Section I of this paper spells out the objective and methodology adopted for estimating the structure of effective incentives in Indian agriculture. Section II presents estimates of effective incentives at crop- and region-specific level while Section III draws the policy implications from these results as also the issues that need further study.

I

Objective and Methodology

Government intervention in Indian agriculture is pervasive. The government tinkers with market mechanism through its price support/procurement policy on the one hand, and its subsidisation of major agricultural inputs on the other. The government's price policy played a role in speeding the adoption of high yielding varieties (HYVs) of wheat and rice in the so-called Green Revolution and it has helped to provide greater certainty for farmers in terms of the prices they can expect to receive. Subsidies have encouraged the use of modern inputs. Estimated subsidies, including irrigation charges that do not cover fully costs and non-payment of water charges, low interest rates and non-payment of credits, low electricity rates and non-payment of electricity charges, and the difference between international and domestic prices of fertilisers, are now equal to about 17 per cent of the agricultural GDP (higher in the case of wheat and rice) and, correspondingly, about 2.5 per cent of total GDP. Other government policies have delinked internal and external markets by imposing quantity and/or price controls over exports/imports of agricultural commodities and by 'canalising' the sale of agricultural exports and imports through public corporations. The government also extends support to agriculture through research and extension programmes. Besides such broad interventions, the government has frequently launched crop-specific programmes with more limited objectives.

The simultaneous implementation of such wide-ranging, and sometimes divergent, policies impinges upon farmers' incentives in many complicated and sometimes conflicting ways. Analysts of the impact of government policies typically have examined their effect on a summary variable—net income per hectare in a given crop—in assessing whether the policies in question have stimulated additional output. More sophisticated analyses also consider the opportunity cost of the policy in terms of the policy-induced substitution between one crop and another. The inclusion of opportunity costs clearly represents an improvement over the simple calculation of net income per hectare. However, both approaches rely on domestic prices in their evaluations. Thus, they implicitly adopt an autarkic view of the agricultural sector and thereby neglect the possibilities of gains from international trade and changes in net foreign exchange earnings.

Another approach, taken in this study, is to analyse how agricultural policies affect the differential between domestic prices (adjusted for subsidies and input costs) and international prices. In other words, are certain crops, and agriculture in general, being protected or disprotected (in effect taxed) by the maintenance of prices that diverge from those that would prevail under free international trade? To see the importance of this question, suppose that policies combine to keep the domestic price of one commodity above the world price (protecting that crop) and prices of a second commodity that could be produced on the same land, below world prices (disprotecting or in effect taxing that crop). Then, from an efficiency standpoint, too much land, labour and capital are being used to produce the first commodity and too little are being used to produce the second. Resources and foreign exchange could be saved by adjusting prices to stimulate a shift of resources from production of the first commodity to the second. Demand could be satisfied and foreign exchange earned on balance by exchanging the increased production of the second crop for imports of the first in international markets.

The differentials between domestic and international reference prices are measured in this study by three standard ratios, referring to comparisons at three levels of increasing complexity—nominal protection coefficients (NPCs), effective protection coefficients (EPCs), and effective subsidy coefficients (ESCs). These coefficients are defined below but basically the NPC indicates incentive to produce a commodity, the EPC indicates incentive to the use of resources (land, labour and capital) in producing the commodity after deducting the cost of importable intermediate inputs, and the ESC adjusts the EPC to take into account taxes and subsidies on non-traded inputs (e g, irrigation, electricity); all relative to what would exist under free trade.

In calculating the international competitiveness of a commodity, transport costs can make a potentially enormous difference. In terms of competing with imports, international transport costs provide a degree of protection for domestic producers. In contrast, exporting means that the domestic producer's price must be low enough to make the product competitive in foreign markets, including transport costs to the market. A simple example will make clear how important this difference is: if international transport costs are $ 10 per ton and the international price of a good at the foreign point of sale is $ 100, then domestic producers could compete effectively with imports providing they produce profitably at a price of $ 110. However, in order to export, domestic producers would need to be able to produce profitably at a price of $ 90. Thus, the competitive import price is about 22 per cent higher than the competitive export price. This means that investments in production could easily earn a high economic rate of return as long as domestic production is substituting for imports, but might become unprofitable once it became

necessary to capture an export market.

To cover this issue of transport costs, the NPCs, EPCs, and ESCs have been calculated under two hypotheses: (a) the crop in question is imported and thus competes at the domestic port with imports including their transport cost (the importable hypothesis) and (b) the crop in question is exported and thus competes at a foreign port including transport costs (the exportable hypothesis). Thus the two different treatments of transport costs allow the analyst to see whether the Indian producer is competitive with imports given the protection accorded by transport costs and what, if any, subsidy would be required to export the crop.

In addition to NPCs, EPCs and ESCs, this study also comments on the size of the price differentials under the assumption that foreign exchange is accorded a notional premium of 25 per cent over the going exchange rate. The inclusion of such a premium is assumed to cover not only the possibility of currency overvaluation under the current trade and payments regime, but also the compensatory change in the exchange rate that would be necessary if all protection were to be eliminated. With the inclusion of such a premium, the coefficients become good proxies for cost benefit indicators such as Domestic Resource Cost (DRC).[1] Finally, the coefficients also are estimated for specific regions and crop varieties to provide some idea of the differences in incentives between regions.

The nominal protection coefficient (NPC) is defined as the ratio of the domestic price to the world reference price of the commodity under consideration. Symbolically,

(1) ... $NPC = PD/PR$,

where,

- NPC = nominal protection coefficient
- PD = domestic price of the commodity in question at the farmgate
- PR = reference price of the commodity in question, i e, what the farmer would have received in the case of free trade.

In this study, the domestic price is approximated either by what the cultivators of the relevant commodity receive or what the government announces as its support/procurement price; the world reference price is derived from the international price, adjusted for transport cost (both foreign and domestic), and marketing and trading margins, including any processing necessary to make the domestic commodity equivalent to the internationally traded commodity.

If the NPC is greater (less) than one, then the commodity is protected (disprotected or in effect taxed), compared to the situation what would prevail under free trade. Of course, one needs to compare NPCs across crops and industries and make an adjustment for the premium on foreign exchange to get a better idea of whether the policy regime provides more or less incentives for production of a given crop than under free trade. For example, if the average NPC was 1.4, then crops with NPCs of 1.4 or more would be receiving an incentive *vis-a-vis* other import substitutes; crops with lower NPCs would be receiving an incentive *vis-a-vis* exportables and, perhaps, non-tradables.

The effective protection coefficient (EPC) is defined as the ratio of value added[2] at domestic prices to value added at world reference prices. Symbolically,

(2) ... $EPC = VAD/VAR$

$= (PD\text{-}Sum(aij\ PDj))/(PR\text{-}Sum(aij\ PRj))$

$= (PD\text{-}TID)/((PD/NPC)\text{-}(TID/NPCi))$

where,

- VAD = value added in domestic prices
- VAR = value added measured at international reference prices
- PD = domestic price of the good in question (the ith good)
- PR = international reference price of the good in question.
- aij = quantity of the jth input used to produce the ith good
- PDj = domestic price of the jth good
- PRj = international price of the jth good.
- TID = sum (aij PDj)
- NPC = nominal protection coefficient of the good in question
- NPCi = weighted average of the nominal protection coefficients of the tradable inputs into good i, with the weights equal to the value shares of the inputs in the reference price.

Thus, a prerequisite for estimating EPCs is a detailed knowledge of the input structure of the commodity under consideration and the nominal protection not only on the output but also on its traded (tradable) inputs.

Again, a coefficient greater than (less than) one indicates protection (disprotection or, in effect, taxation) compared to the free trade. EPC will be greater than (less than) the NPC to the extent that tradable inputs into the production process have a lower (higher) NPC than the product. Thus the EPC refers to the protection accorded to the land, labour and capital (the value added) used in the production of the commodity in question, while the NPC refers to the protection accorded to a commodity, including all the inputs that go into its production. A high NPC does not provide much incentive to apply resources to production if all the inputs have even higher NPCs. Hence, the EPC is a better measure of the incentives accorded to the production of a commodity than the NPC.

Finally, the effective subsidy coefficient (ESC) essentially adds net subsidies (subsidies minus taxes) on non- traded (non-tradeable) inputs in the numerator of EPC and divides by value added at world reference prices. Symbolically,

(3) ... $ESC = (VAD+NS)/VAR$

where

- NS = subsidies(net of taxes) non-traded inputs, VAD and VAR were defi previously.

Net subsidies on traded inputs are alre taken into account in their prices and t are already included in the EPC calculati The ESC goes a step beyond the EPC measuring incentives to the use of resour in a crop or a sector, because it takes i account not only protection and subsid on traded (tradable) inputs, but also net s sidies on non-traded (non-tradable) inpu

The three estimates of protection coe cients defined above help

(1) to measure the extent of diverger (distortion) between domestic and int national prices as a result of t regulatory policies on international tra and domestic markets;

(2) to measure the level and differences 'effective incentives' for cultivators different crops in different regions. T in turn can throw some light on iss related to equity in the distribution incentives across regions, as also ass in identifying the causes that lead faster growth of some crops in certa regions than in others;

(3) to measure comparative advantage a thus degree of competitiveness of vario crops in different regions, consideri foreign trade as a transformation fro tier. This would be valuable informati assisting in allocating existing and inve ment resources more efficiently, a evolving a rational/desirable croppi pattern;

(4) to test the hypothesis of underpricing agriculture in developing countri [Schultz, 1978] and to measure the exte of bias against agriculture and in favou of industry.

II

Estimation of Protection Coefficients and Results

Four commodities are covered in thi study: wheat and rice, India's most impor tant cereals; cotton, an important cash cro used in the country's large textile industry and groundnut as a representative of th oilseeds crop complex. Together, these fou crops account for roughly 45 per cent o gross cropped area and above 50 per cent o gross value of crop output. Wheat, rice an cotton experienced technological break throughs during late 1960s and 1970s i certain regions, while groundnut has lagge behind. Presently, efforts are being made t stimulate oilseed production under th Technology Mission on Oilseeds launche by government of India in 1986 and a buf fer stock/price stabilisation scheme wa introduced in 1989.

Tables 1 and 2 summarise the estimate

of the protection coefficients for each of these crops for the 1980s (1980-81 to 1986-87), for the major producing states and crop varieties, under both the importable and exportable hypotheses.[3] Details on the individual crops can be obtained from Gulati, 1987A (wheat and rice), Gulati, 1987B (cotton) and Gulati, 1988 (groundnut), and the references cited there.

Starting first with the incentives for crops as import substitutes (the importable hypothesis), the crop-specific NPCs[4] for the period 1980-81 to 1986-87 were lowest in case of rice (0.67) and highest for groundnut (1.50) (see Table 1). Wheat and cotton fall in between, with both having NPCs of 0.80. Across states, the lowest NPC is for Andhra Pradesh cotton (MCU-5 variety, NPC=0.63), followed by rice in Bihar and Orissa (NPC=0.65). In sum, domestic prices of rice, wheat, and cotton were all well below comparable world prices, indicating disprotection or effective taxation of these commodities compared to border prices. In contrast, groundnut was highly protected. The relative incentive provided for groundnut by the policy regime and the delinking from international markets is more than 123 per cent higher than for rice.

Turning to effective protection (under the importable hypothesis), the EPCs for wheat, rice, and cotton all were less than the corresponding NPCs. This is because tradable inputs used in these crops were protected, while the crops themselves were disprotected. The difference between the EPC and the NPC is greatest in the case of cotton (13.75 per cent) and smallest in the case of rice (2.98 per cent). The large difference betwee the EPC and NPC in cotton, especially tha of Gujarat (by 31.5 per cent), reflects th large share of tradable inputs, primaril pesticides, in the production of cotton, an the fact that NPC of pesticides is muc higher than NPC of cotton. On the othe hand, the protection on groundnut wa greater than the protection on inputs int groundnut production, making the effectiv protection (EPC) of groundnut greater tha the nominal protection. In sum, for wheat rice, and cotton the prevalence of EPCs tha are below one and below the correspondin NPCs show that the combined effect of th policy regime, including the protectio accorded to industrial goods, has dis couraged resource use in these crops, relativ to a free trade regime. However, the polic

Notes: (a) Domestic price of wheat is approximated by its procurement price for FAO.
(b) World price is of US Hard Red Winter No 2 with ordinary protein, fob US gulf (at official exchange rate) for April to June quarter.
(c) Domestic price of rice is estimated as procurement price of paddy divided by 0.7, which is paddy-rice conversion factor for Indian 'Common' rice.
(d) World price of rice is of Thai white (Milled) 5 per cent Broken, fob Bangkok (at official rate) for October to January.
(e) Domestic price of cotton is approximated by procurement price of kapas (J-34/414F/H-777 variety) divided by 0.34, which is kapas-lint conversion ratio.
(f) World price of cotton is that of cotton outlook index 'A', cif Liverpool.
(g) Domestic price of groundnut is its procurement price (in terms of kernels).
(h) World price of groundnut is of kernels of any origin, cif Europe (Rotterdam).

regime has stimulated the allocation of resources to groundnut.

Not surprisingly, the adjustment for subsidies on non- tradable inputs such as irrigation (canal), electricity and credit and the low level of agricultural taxes (ignored here), produce ESCs that are higher than the respective EPCs. The largest increase occurs in case of rice (by 35.4 per cent) and smallest in case of cotton (by 8.7 per cent). The adjustment for subsidies also changes the ranking of incentives to the various crops. Whereas on the NPC and EPC scales, rice received the lowest protection (the largest rate of effective taxation), on the ESC scale it is cotton that appears with the lowest protection, with an ESC of 0.75 compared to 0.88 for rice, 0.93 for wheat and 1.71 of groundnut. The difference between the highest and lowest ESCs is marginally greater (128 per cent) than for the NPCs (123 per cent), but is lower than that of the EPCs (140 per cent).

The spatial dispersion of ESCs is maximum in case of cotton, with Maharashtra's ESC (0.98) 78 per cent higher than that of Andhra Pradesh (0.55). Across all states and all crops, the highest ESC is that of Tamil Nadu for groundnut (1.71) and the lowest of Andhra Pradesh for cotton (0.55).

Adjusted NPCs (ANPCs) can be estimated for these crops by assuming a national premium on foreign exchange, in this case 25 per cent. The pattern of ANPCs and NPCs is of course similar, but ANPCs are much lower than NPCs. This has important implications discussed in Section III.

Turning to the possibility of exports (the exportable hypothesis), protection coefficients are generally much higher than under the importable hypothesis. This reflects the fact that under the exportable hypothesis shipping costs are *deducted* world prices before comparison with domestic prices, while for imports, shipping costs are added to world prices. Obviously, the higher the share of transport cost in the output price, the greater the deviation in protection coefficients between the exportable and the importable hypothesis. Estimated shipping costs also reflect the distance between Indian ports and the foreign lands where Indian goods are assumed to compete. In case of wheat, for example, Indian exports are assumed to occur to Tunisia. The deviation in results under the importable and exportable hypotheses is therefore much greater than in the case of rice, where competition is assumed to be near Calcutta, in the strait of Malacca. Similarly, groundnut estimates diverge by more than cotton estimates because in the former exports are assumed to be delivered Europe (Rotterdam) while in latter Japan is assumed to be the market.

Except for cotton, the ESCs under the exportable hypothesis are higher than unity for all crops. Even in case of cotton, the ESCs are above unity for Maharashtra and the Punjab (Table 1). The average ESC is lowest for cotton (0.88) and highest for groundnut (2.47), with rice (1.21) and wheat

(2.01) falling in between. Across all states and crops under consideration, Gujarat groundnut has the highest ESC (2.60) and Andhra Pradesh cotton the lowest ESC (0.58). The percentage difference between the highest and lowest ESCs under the exportable hypothesis (348 per cent) is much higher than under the importable hypothesis (215 per cent). These results suggest that cotton, particularly Andhra Pradesh cotton, is an efficient export. Cotton from other states and rice also would be efficient exports with a foreign exchange premium of 25 per cent.

Crop-specific protection coefficients have tended to rise over the seven-year period 1980-81 to 1986-87 (Table 2), suggesting that the disprotection of agriculture has been reduced in the 1980s. Under the importable hypothesis, for example, ESCs of wheat rose from 0.76 to 1.12; ESCs of rice rose from 0.58 to 1.06; ESCs of cotton rose from 0.71 to 0.75 and ESCs of groundnut rose from 1.20 to 2.32. Thus, the maximum increase took place in the case of groundnut (by 93.33 per cent), followed by rice (by 82.76 per cent). In fact in all cases except cotton, ESCs in 1986-87 were above unity. For cotton, rice and wheat the rise is largely explained by the declining trend in world prices, not offset by the devaluation of the rupee. Domestic prices (in rupees) rose about 5-6 per cent per annum, about the same as the wholesale price index in general. In the case of groundnut, domestic prices rose about 10 per cent per annum owing to the growing demand-supply imbalance in the domestic edible oil economy; this contributed to the rising protection for groundnut along with the fall in international prices.

III

Implications and Concluding Remarks

The results of present study suggest following implications:

(1) *Efficient Import Substitutes*: Three of the four agricultural commodities—wheat, rice and cotton—appear to have been efficient import substitutes. The protection coefficients of these crops are below unity in almost all years in the 1980s. In contrast, for groundnut the coefficients suggest substantial protection. A foreign exchange premium in excess of 40 per cent would be needed to make groundnut an efficient import substitute. This result suggests that perhaps too many resources were being devoted to groundnut production in the 1980s, while too few were being devoted to cotton, wheat and rice. This is particularly true in areas where these crops compete directly for resources, such as parts of Gujarat and Andhra Pradesh. A switch of resources out of groundnut, into the other three crops, brought about by a shift in relative prices, probably would have increased efficiency and net foreign exchange earnings.

(2) *High Economic Rate of Return in Agriculture* (particularly cotton, wheat and rice): Investment programmes aimed at increasing the production of wheat, rice and cotton appear to have had high economic rates of return during 1980s. This is suggested particularly by the 'adjusted' protection coefficients—adjusted for overvaluation of exchange rate—which are significantly lower than the unadjusted coefficients, and which would be close to cost-benefit indicators such as Domestic Resources Cost (DRC). In particular, the economic rates of return are likely to be higher than those prevailing in the industrial sector, where protection coefficients generally fall into a much higher range [see World Bank 1987, Chapter 4].

In this regard, long staple cotton in Andhra Pradesh deserves special mention. It appears that the technological breakthrough that took place in Andhra's cotton economy, resulting in a phenomenal rate of growth in yields, offers an opportunity to reap high economic return on investment. Closer linkage with the world economy would thus be desirable from an efficiency standpoint. Of course the resulting rise in cotton's price would raise domestic prices of cotton textiles.

Investment in long staple cotton deserves priority from another angle. While in the case of other commodities, the ESCs under the exportable hypothesis exceed unity, in the case of cotton they are below unity. Hence, cotton production can be increased faster than its domestic demand, the excess making an efficient export.

In contrast, increases in wheat and rice production are likely to be efficient up to the point that these crops remain import substitutes, but the efficiency of exporting these crops is less clear. A foreign exchange premium of at least 25 per cent would be needed to make rice an efficient export. This implies that planners should aim to increase production of wheat and rice basically in line with their domestic demand, with some scope for rice exports. In view of this result, the Special Rice Programme launched by government of India in eastern states during mid-1980s seems a promising investment.

Investment in groundnut appears to be a less attractive proposition from the standpoint of economic rates of return. In this context it may be remarked that large investments under the Technology Mission on Oilseeds would require a high implicit weight for the objective of self-sufficiency, as their justification on purely economic grounds is low.

In calculating economic rates of return, due consideration must be given to subsidies. In particular, rice, which is a water intensive crop, has a much higher economic rate of return in high rainfall areas like Bihar and Orissa (with low ESCs) than in the Punjab-Haryana belt. In fact, if one simulated a scenario where electricity and water are appropriately shadow priced in the low rainfall areas of north-western India (Punjab-Haryana), the results might well suggest diverting resources away from rice cultivation, to less water intensive crops such as maize.

(3) *Inter-State and Inter-Crop Differences in Effective Incentives:* The calculations of protection coefficients across states indicate at least two significant spatial variations: (1) Punjab rice has a much higher NPC, EPC, and ESC than the other states, reflecting higher prices and, the irrigation subsidy; (2) Maharashtra cotton (and to a lesser extent Punjab cotton) received much higher protection and Andhra cotton received much lower protection than the average for cotton, reflecting differences in procurement price policy during the period and, to a lesser extent, irrigation subsidies.

(4) *Input Subsidies and Effective Incentives*: In most cases, subsidies on non-tradable inputs are large and adjustment for subsidies consequently leads to ESCs significantly higher than EPCs. For the crops covered here, estimated subsidies on non-traded inputs range from 8 per cent in cotton and 13 per cent in groundnuts to 24 per cent in the case of wheat and over 30 per cent in the case of rice. For the agricultural sector as a whole, subsidies amount to about 17 per cent of value added [Gulati, 1988] and the equivalent of over 2.5 per cent of GDP. With subsidies of this magnitude, NPCs or even EPCs may not be good proxies for effective incentives. This seems to be particularly true in the case of canal irrigated crops. The study on input subsidies [Gulati, 1988] suggests that subsidies on canal irrigation, because of charges that do not cover costs and because of non-payment of charges, are quite large. In fact, they represent roughly 70 per cent of total estimated input subsidies including electricity, credit and fertilisers. The estimates of subsidies on other non-traded inputs represent a much smaller portion of output price, though in terms of GDP or government budgets, they may be relatively large.

Given the government's large fertiliser subsidy, this statement requires some additional explanation. First, since fertiliser is traded, this subsidy is already taken into account in the EPC, to the extent the fertiliser subsidy lowers domestic fertiliser prices below international levels. Second, the government's fertiliser subsidy, which looms large in the budget, lowers Indian fertiliser prices only somewhat below world prices in the 1980s; part of the subsidy goes to ensure that fertiliser plants could operate profitably at these prices. The portion of the subsidy going to fertiliser producers obviously does not affect agricultural incentives.

Although further work on subsidies is necessary, the relatively small size of the non-irrigation subsidies suggests the possibility that their reduction would not have a large impact on price. This is even more so given the fact that these subsidies are generally not received by many farmers and hence may not affect the cost of the marginal farmer. In case of canal irrigated crops, it appears that best policy would

involve a combination of better collection of higher charges and evolution of a cropping pattern that relies more on crops requiring little water.

(5) *Export Subsidies:* Cotton, especially long staple cotton, can compete in international markets effectively without any export subsidy. What is required is a change in policy environment, particularly the quantitative restrictions on exports. Of course, this would increase the domestic price of cotton and lead to an increase in the price of cotton textiles.

Punjab common rice cannot be exported under the current policy regime without export subsidies. However, if foreign exchange is given a 25 per cent premium, then Punjab rice could become exportable, depending on the international price. During the second half of 1980s, even after allowing for this premium, Punjab rice was not competitive with Thai rice in international market because of the fall in the price of Thai rice and a rise in the domestic price of common rice. Also, if electricity and canal water were appropriately shadow-priced in the Punjab, then its rice could well cease to be an efficient exportable.

Wheat and groundnut probably cannot be considered efficient exportables. Both have ESCs greater than two. Punjab wheat would have required substantial export subsidy, especially during 1985-86 and 1986-87, to compete US wheat in international market. It may be observed that in 1986-87, the ESC of Punjab wheat was as high as 4.07, almost eliminating any possibility of wheat exports. Groundnut with an ESC of 3.76 in 1986-87 also was not really an efficient export[5]

(6) *Underpricing of Agriculture:* The weighted average ESCs (averaged over the 7 years under consideration) for wheat and rice cultivators, who operate on more than one-third of gross cropped area, are below unity. The ESCs are even lower for cotton. These results support the thesis that agriculture is underpriced in developing countries due to their bias in favour of newly emerging industrial sector [Schultz, 1978]. The results are similar to those reported in the recent study of Krueger, Schiff, and Valdes, 1988. As in their study, exported products (cotton) were in effect taxed in India by delinking domestic sales from international markets, while imported food products (edible oils, of which groundnut is a major component) receive substantial direct protection. Factoring in a premium for foreign exchange[6] reduces the protection of edible oils (groundnut) but it means the 'distortion' in the price of cotton, and of rice and wheat is much greater than shown by the unadjusted coefficients.

(7) *Bias against Rice Cultivators:* Of the two major crops of Indian agriculture—wheat and rice—weighted average ESCs are lower in the case of rice than of wheat. This is true almost for all years and all states, except for the Punjab. In case of Punjab, and presumably of Haryana (not analysed here), ESCs for rice cultivators are higher than those for wheat cultivators. These results, therefore, seem to be in line with Mitra's thesis of a bias in Indian agricultural price policy. Mitra, while analysing domestic terms of trade, remarked that Indian agricultural price policy had a bias in favour of wheat growing cultivators of Punjab-Haryana belt and against rice cultivators of eastern India [see Mitra, 1977]. Somewhat similar results emerge out of our study, through a different methodology. However, there is one important difference in our study: that rice cultivators of the Punjab (and Haryana) are more protected than wheat cultivators of the Punjab (and Haryana).

This study also raises a number of important issues that will require further exploration:

(1) *Source of International Competitiveness or Uncompetitiveness of India's Agricultural Products:* Simply put, why is cotton exportable, with prices below world levels, and why are groundnut so expensive compared to imports? On one level the answer is that it is not products but the marginal producers that are competitive or uncompetitive. The delinking of international and domestic markets has allowed domestic prices to diverge from international prices. To the extent that domestic prices have become higher (lower) than international prices, then more (less) resouces have been allocated to the production of the products than would have occurred had free trade prevailed, and production has moved into areas that are perhaps not fully suited to same crops.[7] Correspondingly, this has reduced production of crops that are more competitive internationally. Linking domestic markets more closely to international markets would mean that domestic and international prices would become more similar—in the limit they would be exactly the same. This would mean that the domestic producers of all crops would be competitive. Of course, it also would mean a shift from the current allocation of resources among crops; resources would shift out of those crops that had been protected, leaving production only in areas that can better compete internationally. Resources would shift into the production of crops that formerly had been disprotected.

On another level the question is what can be done to make Indian crops more competitive. The foregoing results are indicative of static inefficiencies, resulting from relative price distortions, but what do they say about investment? As noted above, when EPCs and ESCs are adjusted for the shadow price of foreign exchange and projected over time, they serve as good proxies for such cost benefit indicators as DRCs (Domestic Resource Costs) and thus are suggestive of the relative returns from investment in different crops.

It is also true that these indicators only reflect existing technology, and do not indicate what might happen if the technol[ogy] changed, for example, if a high yield[ing] groundnut variety were developed. Howe[ver,] this point should not be taken as an ar[gu]ment for protection of certain crops in or[der] to develop new varieties (a variant of [the] infant industry argument). The linkage b[et]ween high prices and development of n[ew] seed varieties is even more tenuous in In[dia] than elsewhere, given the delinkage of Indi[an] research and extension services from mar[ket] signals. If such high yielding varieties [are] developed by Indian or foreign research[ers,] then arguments might be made for a favo[ur]able price policy, in order to stimulate rap[id] dissemination. In the meantime, howev[er,] there is no dynamic rationale to engage [in] a protective price policy that will result [in] static inefficiency.

(2) *The Role of Processing and Marketi[ng] in Competitiveness:* The analyses of prote[c]tion coefficients reflect two elements on t[he] domestic side:

(a) relative crop yields adjusted for relati[ve] costs of land, labour, and capital a[nd] the exchange rate—even if Indian yiel[ds] are low, lower prices of Indian facto[rs] of production (in foreign currenc[y]) could leave Indian agricultural outp[ut] competitive in world markets;

(b) cost of transport, marketing and pr[o]cessing (very few agricultural produc[ts] enter the world market in a complete[ly] unprocessed state).

To the extent that marketing, transport, an[d] processing margins are high in India, th[e] price at the farmgate is squeezed and India[n] products tend to appear uncompetitive wit[h] imports and too high priced to be exporte[d]. For example, in the edible oil comple[x,] marketing and processing costs are high b[y] international standards. Moreover, the col[]lection and transport methods contribute t[o] the aflatoxin problem for groundnut an[d] thereby make Indian production of ground[]nut less competitive internationally. Thi[s] problem affects not only groundnut kernel[s] but the by-products from refining ground[]nut, which elsewhere can be sold for cattle feed, but which in India contain high level[s] of aflatoxin. Another example of the impor[]tance of trading margin is found in a recen[t] study of the export potential of agricultur[e] for fresh vegetables [Bombay Chamber o[f] Commerce 1986]. The study shows tha[t] wholesale margins represent 60-80 per cen[t] of the fob Bombay price and farmgat[e] prices only 20-40 per cent. Hence, ther[e] seems to be great scope for making Indian agricultural products more competitive by increasing the efficiency of processing and distribution, as well as by increasing agricultural yields.

(3) *The Impact of Subsidies on Prices, Resource Allocation and Distribution:* As mentioned above, the estimated subsidies represent a large fraction of the cost of production of the four crops under consideration. In the calculation of ESCs, these subsidies have been treated as lowering the

erage cost of production and the price eeded to cover costs. However, it is quite ossible that the subsidies do not have this fect on prices and costs, but instead mainly ave distributional effects.

This is because, first of all, most of the timated subsidies--irrigation, electricity, nd credit—do not go to all farmers but only ose with access to inputs such as canal ater, power lines and bank loans.[8] In most ases the subsidies do indeed lower costs of ese producers.[9] Hence these farmers are ncouraged to use more resources and produce more. However, numerous farmers ithout access to these inputs continue to roduce the crops in question. To the extent hat they represent an important share of he market, then it is their unsubsidised osts that determine the prices of the ommodities—the subsidised producers mply earn higher incomes at the prices that over costs of the unsubsidised producers. n this case the subsidies have mainly a istributional effect. Second, in order to ccess the subsidised inputs, it may be ecessary for farmers to make payments outside normal channels, for example payments o canal operators to receive releases of canal vater. Thus, the true costs of these inputs o the farmer may be greater than estimated ere,and again the provision of these inputs o farmers at prices below cost would mainly ffect the distribution of income and not ncentives. In sum, to the extent that either of these points is true, the ESCs overstate the ncentives to producers. More importantly, he impact of the 'subsidies' on prices is less han what might be expected and their impact on rural income distribution may be greater. All this suggests that further work s needed to analyse the true impact of subsidies'.

(4) *India's Potential Influence on World Market Prices:* The estimates of protection/incentives described above treat world market prices as independent of the volume of India's sales or purchases. However, large scale buying or selling could alter world prices. In some cases this may be important for countries like India. For example, the world rice market is relatively small and India's entry either as a large importer or exporter could disturb world prices substantially. Adjusting for this possibility would mean that under the importable hypothesis the protection coefficients for rice should be even lower, i e, Indian rice is an even more efficient import substitute than shown above and therefore investment in rice would have even higher economic rates of return. At the same time, exports would be less attractive than shown above, because additional Indian exports would lower the price. These considerations should not, however, be overstated. First, there is the question of how much extra rice, or other commodities, would be produced and exported with a shift in relative prices, i e, what is the domestic supply elasticity of output. Second, additional trade would in general be beneficial, even taking into account the effect of additional Indian sales or purchases on price. However, the standard optimum tariff models suggest that it may not pay for India to go to completely free trade[10] in cases where it affects the international price significantly.

Notes

[Results and policy implications of this study were presented in a seminar by the author in the National Institute of Public Finance and Policy. I would like to thank various participants, particularly A Bagchi, Sudipto Mundle, B N Goldar and A Das Gupta for stimulating discussion on the subject. Thanks are also due to Janes Hanson and Garry Pursell for their comments.]

1 See Garry Pursell and Neil Roger (1985) and Pasquale L Scandizzo and Colin Bruce (1980), for further details.

2 Value added as used here refers to the difference between the price of the output and per unit value of all traded (tradable) inputs that go to produce one unit of output. Theoretically, the non-traded inputs should be decomposed into their tradable and primary, non-traded components, and different treatments accorded to both, but in practice such refined treatments are precluded by lack of data.

3 In the case of wheat, the co-efficients, are estimated separately for four states—Uttar Pradesh, Punjab, Haryana and Madhya Pradesh. Fair Average Quality (FAQ) of domestic wheat, as categorised by Food Corporation of India, is compared with US Hard Red Winter No 2 with ordinary protein. In the case of rice, the coefficients are calculated for Andhra Pradesh from the south, Bihar and Orissa from the east, Punjab and Uttar Pradesh from the north and Madhya Pradesh from the central region. Indian 'common' (FAQ) rice is compared with Thai (milled) white, five per cent broken. The protection coefficients for Cotton are worked out for Maharashtra, Gujarat, Punjab and Andhra Pradesh. In case of Maharashtra, Hybrid-4 variety is compared with its like Mexican cotton; Gujarat's Shankar-4/6 is compared with California (SM 1 1/8"), Punjab's J-34/320 F of is compared with Orleans/Texas (1") and Andhra MCU-5 with Giza 67/69/81. In case of groundnut, protection estimates are for Gujarat, Andhra Pradesh and Tamil Nadu.

4 The crop specific NPCs were calculated as a weighted average of the state NPCs, with value of the crops in the states used as the weights.

5 Some exports of groundnut occurred in the 1980s, but they went almost wholly to the Soviet Union and the other eastern bloc countries, where prices of groundnut and groundnut oil may be substantially higher than in world markers. Another factor in these exports may be the accounting rates of conversions used for the inconvertible currencies in which this trade is conducted.

6 Krueger, Schiff, and Valdes call this the indirect protection effect. As discussed above, it arises from (a) over- valuation of the currency and (b) the compensating change in the exchange rate that would be necessary to offset the elimination of protection economywide.

7 This shows up quite clearly in a recent study on natural rubber production in India [Mani, 1989]. Rubber production is competitive with Malaysian rubber only in a small part of Kerala, but protection and subsidies allowed production to extend into climatically less suitable zones.

8 In contrast to these inputs, the subsidy on fertiliser is accessible to all farmers and thus would almost certainly affect costs of crop production of both the average and marginal farmer.

9 In the case of credit, lower interest rates may not lower costs, the credit may simply substitute for the farmer's use of his own funds, or be invested elsewhere.

10 See for example Johnson, 1971. In the simplest partial equilibrium model, free exports are preferable to autarky, provided the elasticity of demand for the product is greater than the share of the country in world exports of the commodity, although some restriction of trade will lead to still higher benefits for the country.

Self-Sufficiency in Oilseeds
Within Grasp or Elusive Goal?

K N Ninan

This paper examines the prospects of India realising her goal of self-sufficiency in oilseeds, in the light of th optimistic crop outlook for oilseeds in 1988-89. While analysing the various policy options for India to becom self- reliant in this crucial sector, it suggests that the main constraint for increasing oilseeds production in Indi is technology. It cautions against a strategy of laying sole emphasis on the price mechanism which can only b at the cost of coarse cereals, the main competitors of oilseeds and which are mostly consumed by people wit low incomes.

CROP forecasts for 1988-89 suggest that India is poised to reap a bumper harvest of over 15 million tonnes of oilseeds. If true, this will be an all-time record compared to the last record harvest of nearly 13 million tonnes of oilseeds during 1984-85. Favourable monsoons along with institutional support no doubt would account for this feat. But the moot question is: Does this represent a structural break in the production trends of oilseeds or is it just a freak phenomenon? Is the goal of self-sufficiency in edible oils and oilseeds which has been accorded priority in the development plans of the country within grasp or elusive?

Demand-Supply Gap

It is indeed ironic that India which is one of the largest producers of oilseeds in the world has also become the largest importer of edible oils in the world. The import bill on edible oils which was just around Rs 15 crore in 1975-76 currently averages at over Rs 1,000 crore per annum. Between 1975-76 to 1986-87 India has spent nearly Rs 7,000 crore for importing edible oils. In fact it now ranks second in our import bill after petroleum. This cannot go on forever without affecting the growth and stability of the Indian economy. The necessity for attaining self-sufficiency in this crucial sector, therefore, cannot be disputed.

The demand for vegetable oils and fats in the country has been rising rapidly at over 4 per cent per annum. But domestic output has been growing at a sluggish pace, at just around 2 per cent per annum, resulting in a big gap in the domestic market which is estimated at 1 to 1.5 million tonnes in terms of oil or about 3.5 million tonnes in terms of oilseeds. The National Commission on Agriculture (NCA), 1976 and other agencies have suggested that the demand for vegetable oils by the year 2000 will range between 8 to 10 million tonnes or more.[1] Supply projections made by the NCA indicate that if the required investment takes place, if average yields of oilseeds were to increase to over one tonne per hectare as against the present average of about 0.6 tonne per hectare, and if area under irrigated oilseeds were to increase to over 5 million hectares as against the present level of 2 to 3 million hectares, then the supply of vegetable oils may go upto about 9.7 million tonnes by the year 2000. But other studies suggest that not only is the supply likely to be at a lower level but also the deficit which is presently around 1 to 1.5 million tonnes may rise to about 2.8 to 4.5 million tonnes by the year 2000.[2] The Planning Commission envisages the demand for vegetable oils to increase to about 8 million tonnes by 2000 A D equivalent to about 26 million tonnes of oilseeds, that is, double the present level of output of around 11 to 13 million tonnes of oilseeds. For the Seventh Five Year Plan, the target set by 1990 is about 5 million tonnes of vegetable oils, equivalent to about 18 million tonnes of oilseeds. To reach this target India's oilseeds output will have to increase at about 6.5 to 7 per cent per annum as against the present growth rate of about 2 per cent per annum.[3] Though our oilseeds output is expected to rise to over 15 million tonnes this year, it is important to recall that the original target for this year as per the Seventh Plan document was about 17 million tonnes.

Factors Inhibiting Growth

It is necessary to identify the factors inhibiting the growth of oilseeds in India. Is it the lack of remunerative prices or technology or are there other factors which explain the slow pace of growth of oilseeds? The role of price in stimulating agricultural production is well known. But in a dynamic setting it is technology which is a more important factor. Development of cost-effective or high yield low cost technology can itself change the scenario for oilseeds. A recent study reveals that over the past three decades, while movements in relative prices have been favourable to oilseeds, the reverse is the case in respect of relative yields where the trends have been against oilseeds, which clearly shows that technology is the major constraint.[4] A word of caution may be mentioned about a strategy which lays sole emphasis on the price mechanism to boost oilseeds ouput. Any price policy favouring oilseeds could only be at the cost of coarse cereals, which are the main competitors of oilseeds and are also mostly consumed by the low income people. Hence while solving one problem a new problem may get created through disincentives for producing coarse cereals. Moreover, the Indian experience shows it was only when there was a technological breakthrough that wheat and rice production registered a significant increa This will have to happen in the case oilseeds also.

But there are some who contend that pri is the main constraint on increasing oilsee production.[5] The policy of importing ed ble oils has been criticised on the ground th it unduly depresses domestic prices ar hence a disincentive to increase oilseeds pr duction. It may be mentioned that India edible oil prices have ruled higher than wor prices for several years in the recent pas One could easily argue that on grounds o economic efficiency and comparative advar tage it would be better to import edible oi than support a high cost domestic econom This is, of course, not to argue the case fo imports. Given India's bad experience wit food aid (with strings attached!) it necessary for us to be self-sufficient in a essential commodity like edible oils. A stud by M L Dantwala points out that the whol sale price index for oilseeds (347.7) i 1986-87 was distinctly higher than for cerea and cotton (276.3 and 184.7 respectively). Further, the annual rate of increase fron 1950-51 to 1986-87 in oilseed prices has als been higher than that for other agricultura commodities. The rate of increase wa relatively much higher during the recen period from 1970-71. The study furthe observed that during the last decade pric parity measured by the wholesale price inde has moved distinctly in favour of oilseeds The percentage increase in procurement/sup port prices for different crops betwee 1975-76/1977-78 to 1985/86 indicated tha the increase in support prices for differen varieties of oilseeds had been more generou compared to increases in the support price of other agricultural commodities. Oilsee growers, therefore, cannot complain o remunerative prices not being available. I may, however, be noted that though there ha been a secular rise in the prices of oilseeds and oils, the benefit of a price rise has gon more to the trader than the grower.[7] I oilseeds cultivation is to be made more attractive, it is necessary to help oilseed growers realise a better share in the consume rupee. The need for eliminating the role o middlemen and speculative interests in the trading of oilseeds and oils, therefore, cannot be disputed.

The limitations of relying solely on the

ce mechanism have been mentioned rlier. Though the expected revenue from seeds is an important factor behind mers' crop production decisions, it may noted that profitability is not determin- by price alone but also by other factors ch as yield, cost of cultivation, production d market risks, etc. Moreover, it is well own that aggregate supply response of riculture to price changes is low in most veloping countries.

TOWARDS SELF-RELIANCE

If we observe the past performance of lseeds it is seen that area has continued to the main source of growth in oilseeds out- it, yield being of secondary importance.[8] he prospects for attaining growth through n extension of cultivated area are minishing fast. If we are to double our lseeds output by the turn of the present ntury which is the goal set by our plan- ers, then yield rates would have to be step- ed up considerably. The wide differences current yield rates across the states itself ndicates the scope for increasing yield levels. mproved varieties of oilseeds which give 20 30 per cent higher yields than present rains are available. But they don't seem to ave made much of an impact so far. Owing o various production and market risks armers appear to be reluctant to adopt the mproved technology because of the high in- estment requirements in terms of fertilisers, esticides and more so because oilseeds ultivation is concentrated in high risk egions where returns on investments are ncertain. Shortage of certified quality seed lue to constraints in large-scale multiplica- ion,[9] high cost of seeds due to high verheads, low priority given to oilseeds esearch and development in the country un- il very recently etc, are some of the reasons or the low adoption rates of the improved echnology.

Irrigation is another input which could in- rease per hectare yield of oilseeds. Yield of oilseeds under irrigated conditions are substantially higher (about 2 to 3 times higher) as compared to those secured under rainfed conditions. Further oilseeds require ess water than other crops such as rice. In fact, the water required to irrigate one acre of area under paddy is sufficient to irrigate about four acres of area under groundnut. But the impact of irrigation on oilseeds cultivation has varied from region to region. While it has had a positive influence on oilseeds cultivation in the southern states and Gujarat, in the northern states the spread of irrigation and new agricultural technology has affected oilseeds cultivation, farmers preferring to switch over from oilseeds to other lucrative crops such as paddy, wheat, sugarcane when irrigation is available.[10] Rabi groundnut which is usually raised with irrigation support is not suited for northern India because of the extreme temperatures which affect the crop's growth. But in southern and western India rabi groundnut which gives higher yields than kharif groundnut is picking up. Increasing the coverage of rabi groundnut, including oilseeds in the recommended crop pattern for command areas, shifting some of the irrigated area in favour of oilseeds are some suggestions worth considering. In this context the suggestion mooted for charging irrigation on a volumetric basis (since oilseeds consume less water) should be seriously considered.

Two important developments which will influence the future course of India's oilseeds economy deserve to be mentioned. One is the constitution of a Technology Mission on Oilseeds by the government of India in May 1986 which aims at harnessing the best of production, processing and management technologies to accelerate self-reliance in oilseeds through an improvement of the crop production, post harvest and processing technologies, transfer of technology and farm support systems, guarantee support prices to farmers and also support to industry in the co-operative and private sector for processing, storage and marketing.[11] A Rs 170 crore National Oilseeds Development Project (NODP) covering 180 districts in 17 states is presently under implementation. Another Rs 125 crore Oilseeds Production Thrust Mission is being implemented since August 1987 covering 246 districts in 17 states, including 151 NODP districts. Though it is still too early to assess the impact of the Technology Mission on India's oilseeds economy, it is interesting to observe that during 1984-85 in the pre-technology

mission period when 74 per cent of the meteorological sub-divisions in the country had normal or excess rainfall, oilseeds output peaked to 12.95 million tonnes whereas in 1987-88, after the advent of the Technology Mission in spite of only 40 per cent of the meteorological sub-divisions reporting normal/excess rainfall, oilseeds output was of the order of around 12.4 million tonnes. In 1988-89 the output is expected to peak to over 15 million tonnes, which cannot be solely attributed to the good monsoons.

The other important development is the scheme to restructure the oilseeds and edible oil economy of india by bringing farmers together under Anand-type co-operative federations under the auspices of the National Dairy Development Board (NDDB). These co-operatives procure oilseeds directly from its members (i e, oilseed growers), provide technical input and extension services for production enhancement programmes and also look after all activities right from procurement, processing and marketing to final sale of product. In the process not only are farmers paid a fair price based on standardised quality assessment but also the consumers are given a quality product at a fair price. As on January, 1989 there were 3000 Anand-type oilseed co-operatives in seven states with a total farmer membership of 6 lakh and covering an area of 13 lakh hectares under oilseeds spread over 14,000 villages. It is proposed to extend the programme further and cover an additional 12 lakh farmers and 25 lakh hectares in nine states with an investment of Rs 450 crore. Recent studies show that farmers participating in such co-operatives have benefited by earning additional income of Rs 30 to Rs 50 per quintal of oilseeds sold, which clearly shows that institutional intervention through mechanisms such as co-operatives, regulated markets can help oilseed growers realise a better share in the consumer rupee.[12]

Since 1985 the Crop Insurance Scheme has been extended to oilseeds cultivation also. The rate of premium for oilseeds has been fixed at one per cent of the amount insured as against 2 per cent for foodgrains. If popularised this scheme would help cover the production risks faced by the oilseed growers.

For the present India cannot do away with imports of edible oils. However, it has been suggested that instead of importing edible oils, we should import oilseeds since they are not only cheaper but also they could benefit our crushing industry which is hitherto grossly underutilised. One way of financing our imports would be to encourage the exports of HPS groundnut, oilcakes and other surplus agricultural commodities. The policy of supplying cheap imported oils at less than domestic prices to the vanaspati industry has been criticised by many. Almost 30 to 50 per cent of the imported oils is allocated to the vanaspati industry and in turn the vanaspati industry has to maintain an informal price control on the final product. Since vanaspati (refined oil) is mostly consumed by the upper income groups, the policy of supplying cheap imported oils to the industry has been questioned. Rationalising the price structure of imported oils is therefore one of the suggestions for augmenting resources for oilseeds research and development. In this context it is gratifying to note that the government has taken a positive step in this direction recently by revising the price of imported oils to bring it closer to the domestic price.

The long-term strategy to make India self-sufficient in its requirements of edible oils should lay emphasis on technological upgradation, apart from providing suitable economic incentives and institutional reforms. Investment in research to evolve location-specific, high-yielding and pest-resistant varieties of oilseeds should be stepped up considerably. Apart from increasing the coverage of irrigated area under oilseeds it is also worth considering diverting some of our cereal area for oilseeds cultivation. For instance, rapeseed-mustard could be grown in place of unirrigated wheat which is not as remunerative as rapeseed-mustard. Further, apart from extending oilseeds cultivation to new areas, we should also exploit non-traditional sources of oil such as cottonseed, rice-bran. If we fully exploit the potential of cottonseed, rice-bran and oilseeds of forest/tree origin, it would be possible to generate an additional 2 million tonnes of oil. Oil-Palm, if popularised could be another important source of edible oil. Its per hectare oil yield is the highest (over 5,000 kg) as compared to other crops like coconut (615 kg), sunflower (275 kg), groundnut (201 kg) rapeseed-mustard (161 kg), soyabean (120 kg) and sesamum (82 kg).[13] It is a capital-intensive crop and suited only for large-scale production under corporate or co-operative management. An advantage is that it is not a seasonal crop but is produced all-round the year and is also singularly free from pests and diseases.[14] It gives a steady stream of income spanning over 30 years after an initial gestation period of 5 to 7 years. India is trying to popularise Oil-Palm cultivation in Kerala, Andaman Nicobar Islands, Karnataka and other southern states.

Conclusion

The main constraint for increasing oilseeds production in India is technology. Though price is an important tool for increasing agricultural production, in a dynamic setting it is technology which is a more important factor. Development of cost-effective or high yield low cost technology can itself change the scenario for oilseeds.

It is necessary to caution about a strategy of laying sole emphasis on the price mechanism for increasing oilseeds output which can only be at the cost of coarse cereals, which are the main competitors of oilseeds and also mostly consumed by the low income people. Owing to the dominance of private traders and considerable speculative activities in the trading of oilseeds and oil the benefit of a price rise has gone more t the trader than the oilseed grower. The nee for institutional intervention throug mechanism such as co-operatives, regulate markets, in order to help oilseed grower realise a better share in the consumer rupe and also make oilseeds cultivation more at tractive, therefore, cannot be disputed.

If India is to realise her goal of sel sufficiency in oilseeds then her strategy fo oilseeds should lay emphasis on techno logical upgradation, apart from providin suitable economic incentives and institu tional reforms.

Sources of Recent Growth in Rice and Wheat Output

Deepak Ahluwalia

This paper measures the sources of growth in output in the two principal foodgrains, wheat and rice, over the period 1970-71 to 1983-84. The major producing states are considered individually as well as on the aggregate. The analysis is conducted in two parts. The first part analyses growth from point-to-point in the 'peak' years of foodgrain production—1970-71, 1978-79 and 1983-84. The second part contrasts these results to the 'trough' years—1972-73 and 1979-80.

The major conclusions suggested at the aggregate level are: (a) Output differences between peak and trough years are primarily due to variations in yields on unirrigated land. (b) Irrigated yield increases have been a substantial and increasing source of growth in both rice and wheat output, especially the former. (c) In the peak years, changes in the area components contributed more to growth in wheat than rice. The better quality of the incentive package available to wheat growers might be behind this development. However, in the trough years the area components accounted for a greater share in the growth of rice than wheat.

TO add to the knowledge of the growth mechanism in Indian agriculture, an exercise to measure the sources of recent (1970-71 to 1983-84) growth in wheat and rice output is attempted in this paper. A state-wise analysis for the major producing states is proposed with data which to the best of our knowledge has hitherto not been used for such purposes.

Two methods of analysis have generally been employed in identifying the sources of growth in Indian agriculture. One decomposes time series data on agricultural output to obtain the contributions made by growth in crop area and in yield levels. The other uses production function analysis to work out the contributions of different inputs like fertilisers, labour, mechanisation, etc, to variations in output. This paper works within the framework of the first methodology but extends it to account for differences in irrigated and unirrigated acreage.

The rest of the paper is divided into four sections. Section I lays down the methodology for measuring sources of growth; Section II deals with the data and results on rice and wheat for the 'peak' foodgrain production years, i e, 1970-71, 1978-79 and 1983-84; Section III analyses the same for the 'trough' years, 1972-73 and 1979-80. Section IV ends with the conclusions.

I
Methodology

Output growth in each crop is decomposed into four components: growth due to changes in (i) new area brought under cultivation, (ii) shift from unirrigated to irrigated area, (iii) irrigated yields, and (iv) unirrigated yields. The underlying hypothesis is that all new area brought under cultivation is evaluated at the unirrigated yield levels. It needs to be recognised that new area here need not imply hitherto unused area alone; it can also be a switch in area from some other crop. The present exercise seeks to differentiate between this additional land brought under cultivation and a switch from unirrigated to irrigated land under the same crop.

Q = Total output; Q_1 = Irrigated output; Q_2 = Unirrigated output; A_1 = Irrigated area; A_2 = Unirrigated area; L = Total area cultivated.

$$
\begin{aligned}
Q &= Q_1 + Q_2 \\
&= A_1(Q_1/A_1) + A_2(Q_2/A_2) \\
dQ &= dA_1(Q_1/A_1) + dA_2(Q_2/A_2) + A_1 d(Q_1/A1) \\
&\quad + A_2\, d(Q_2/A_2) \\
&= dA_1(Q_1/A_1) + (dL - dA_1)(Q_2/A_2) + \\
&\quad A_1\, d(Q_1/A_1) + A_2 d(Q_2/A_2). \\
&= dL\,(Q_2/A_2) + dA_1\,(Q_1/A_1 - Q_2/A_2) \\
&\quad + A_1\, d(Q_1/A_1) + A_2 d(Q_2/A_2) \quad \ldots(1)
\end{aligned}
$$

$$
\frac{dQ}{Q} = \frac{dL}{L}\frac{Q_2}{Q}\frac{L}{A_2} + \frac{dA_1}{A_1}\,[Q_1/Q - (Q_2/Q)\,(A_1/A_2)] + \frac{d(Q_1/A_1)\,Q_1}{(Q_1/A_1)\,Q} + \frac{d(Q_2/A_2)\,Q_2}{(Q_2/A_2)\,Q}
$$

On the RHS of equation (1) the first component measures increase in new area weighted by unirrigated yield as per our assumption that all new area brought under cultivation is unirrigated. The second catches change in irrigated area weighted by the yield differential between irrigated and unirrigated land. This component can therefore be interpreted as representing the growth due to transfer from unirrigated to irrigated land. The third and fourth components measure growth due to changes in yields on irrigated and unirrigated lands weighted by their respective acreage.

II
Analysis for 'Peak' Years

The major producing states are analysed individually as well as on the aggregate. The period 1970-71 to 1983-84 is broken up into two—1970-71 to 1978-79 and 1978-79 to 1983-84 and compounded rates of growth from point-to-point are studied. The rationale behind choosing these years was (a) 1983-84 represented the latest year for which all necessary data was available, (b) all three years were 'peak' years in foodgrains production with growth rates from one to the other closely paralleling the trend rate over the whole period.

Rice

Thirteen states, cumulatively accounting for over 90 per cent of total rice output in the country, are considered. Data on output, area and yields is presented in Annexure 1. Some comments are in order on its compilation since the data has been sparingly used. Earlier studies of this nature have generally relied on data gathered from the cost of cultivation studies. For our purposes this source is inadequate because of the limited coverage of these studies.

Total rice output, total acreage sown and yields on irrigated and unirrigated land were directly available on a state-wise basis for each of the three crop seasons—autumn, winter and summer, from the agricultural Ministry's publication—*Area and Production of Principal Crops in India.* There were a few missing observations on the yield numbers; these had to be filled in by relying on values available on the state for other years and performance of neighbouring and similar states in the year under consideration. This data is however inadequate since we require separate area and output numbers for the irrigated and unirrigated segments.

Of the three seasons, autumn, winter and summer, it is only the first two which are quantitatively important. While in some states the major portion of the rice crop comes in autumn (e g, Madhya Pradesh and Maharashtra), in others (like Orissa and Assam) the main harvest is reported for winter. Autumn plus winter together represent the kharif season and this is the main rice-growing season. Summer can be dropped from the analysis without much loss of generality.

The thrust of the analysis is to work with *one* set of figures each for irrigated and un-

rigated acreage for the kharif season. Total rea sown was added up for autumn and inter. However the proportion of irrigated cultivated area is reported only for the hole year. The breakup between irrigated nd unirrigated land for the kharif season as derived using this proportion; the nderlying assumption being that the ercentage of area irrigated in the kharif eason was the same as the annual percen- age. A set of 'representative' kharif yield evels were derived by weighting the reported utumn and winter yields by their respec- ve outputs. The area numbers were then nultiplied by the set of kharif yields to ob- ain the corresponding irrigated and un- rigated output levels. To check for con- istency, this *derived* total output (i e, out- ut from irrigated plus unirrigated land) was ompared to the directly available figures on otal output. The results are shown in An- exure 1 as the ratios of derived total out- ut to actual total output. While a perfect natch between the two sets (i e, ratio = 1) vas obtained for a few observations the leviations in the rest were within acceptable imits (all between ± 0.1). Repetition of the exercise including the summer figures did not make any significant difference to the atios, so the autumn plus winter group was adhered to. The reason for the less than perfect result seems to lie in the unreliabili- y of the reported irrigated and unirrigated yield levels, as has been noticed before by other researchers. However the present ex- ercise makes some headway in juggling with these figures rather than just dismissing them outright on account of their inaccuracies.

Thus all the necessary data on output, area and yields was compiled and the methodology outlined earlier to track down the sources of growth in output was applied to it. The results are presented in Table 1.

It may be noted that a statistical discrepancy exists, that is, the sum of the four component terms on the RHS does not always add up to the LHS. This is due to two reasons:

(i) the inaccuracies in the data available (mainly on yield levels), as can be seen from the ratios of derived to actual output.

(ii) the choice of whether base year or terminal year weights should be used on the component terms on the RHS. In the results shown above base year weights have been used.

While the first problem has to be lived with, the second can be investigated further and consequently the exercise was repeated using terminal year weights. Although the numbers differed slightly between the two sets of results the basic pattern remained the same. So, only the base year weighted results are shown here.

For the period 1970-71 to 1978-79, total growth in output for all states taken together was 2.8 per cent pa. Seventy per cent of this could be explained by the increase in both the yields (45 per cent on irrigated and 25 per cent on unirrigated land) while 23 per cent was due to an increase in new area brought under cultivation. Since total acreage did not rise as much, this suggests some switch from other crops to rice. Only 12 per cent of growth was accounted for by a shift from unirrigated to irrigated land. (The surplus of 5 per cent is due to statistical discrepancy.)

Point-to-point growth from 1978-79 to 1983-84 is lower than in the earlier period—now 2.2 per cent pa. Ninety per cent (up from 70 per cent in the earlier period) of this growth is accounted for by increases in both the yields (50 per cent on irrigated and 40 per cent on unirrigated land). This is a reflection of more extensive use of HYV and fertilisers, especially on the unirrigated acreage. The contribution of the new area component is down to 8 per cent from 23 per cent, suggesting that the switch to rice cultivation from other crops had slowed down. Growth due to shift from unirrigated to irrigated land plays a negligible (3 per cent) part.

Among the main states, there are negative signs on growth in output in Bihar and Tamil Nadu for the period 1978-79 to 1983-84 and Madhya Pradesh and West Bengal for the period 1970-71 to 1978-79. This is because in these states the 'peak' years in foodgrain production did not correspond to the all-India 'peak' years. Instead of 1983-84 production peaked in Tamil Nadu in 1981-82 and in Bihar in 1980-81. In Madhya Pradesh and West Bengal production peaked in 1977-78 instead of 1978-79. Consequently, to get a clearer picture of the growth process in these states, the decomposition methodology was applied to their individual 'peak-to-peak' years. The results are given in Table 2.

The regional-state level picture suggests:

(i) Rising yields on both irrigated and unirrigated acreage, especially the latter, are an increasing source of growth in the eastern and central states of Assam, Bihar, Madhya Pradesh and West Bengal. These are states which depend heavily on the monsoon for a good output, and a peak-to-peak analysis would be expected to show unirrigated yields explaining a sizeable share of their output growth. The signs on the area components suggest a switch out of rice cultivation in West Bengal in both periods, Orissa in the first and Bihar in the second period.

(ii) Towards the north, Punjab and Haryana registered very high growth rates of output in the first period, which can partly be explained by the low base they started from. Growth in Punjab was still high in the second period, though Haryana's had tapered off. The contrast from the eastern region was that the area components were large, and over the two periods, an increasing source of growth. This was true of both new area brought under rice cultivation (which was mainly a switch from other crops into rice) and the shift from cultivation on unirrigated to irrigated land. Uttar Pradesh showed the same trend, only here unirrigated yields were an important source of growth too; which is understandable since here unlike as in Punjab and Haryana, a major part (70 per cent in 1983-84) of the rice crop is still grown on unirrigated land.

(iii) Towards the south, output growth was very small in Tamil Nadu, Karnataka and Kerala (negative in the last one). Only Andhra Pradesh showed a healthy growth (over 3 per cent pa) over both periods and this was primarily because of rising yields on irrigated land. In Kerala a shift out of rice cultivation is suggested in both periods, in Karnataka this shift out was limited to the first period while in Tamil Nadu it occurred in the second period.

To gain additional insight, the question was asked—what would the aggregate picture look like if the high achievers such as Haryana and Punjab were excluded from the analysis? The answer is a sharp fall in the aggregate growth rate of output and this due to a decrease in the contribution of both new and transferred area as well as irrigated yields. The new aggregate equations are reproduced in Table 3 and the notable difference between them and the earlier ones is the larger contribution of unirrigated yields in both the periods (36 per cent-50 per cent versus 24 per cent-40 per cent in the earlier analysis including Punjab and Haryana). The success of the technology extension programme in raising both the yields is again brought out by the comparison between the equations for the two periods.

To sum up, between the two periods 1970-71 to 1978-79 and 1978-79 to 1983-84, on an aggregate level, the picture which comes across is a rise in the share of both the yield levels in explaining output growth in the later period *vis-a-vis* the earlier one. This seems to be the result of the extension of 'modern' technology comprising HYV, fertilisers, et al, which really took off in the second period through research, training and visiting programmes and other measures. One interesting result which shows up is the substantial contribution of rising yields on unirrigated land. This development, brought about by the use of new seed varieties on land where water is not assured, has added to the instability in rice production in the country. In a drought year, a large fall in produce from the unirrigated acreage may be expected. This point is further investigated in Section III where the sources of growth in two drought years—1972-73 and 1979-80—are studied.

WHEAT

Eight states cumulatively accounting for over 95 per cent of the total production of wheat in the country are considered. Data on output, area and yields is presented in Annexure 2.

Total output and area figures were directly available as were the irrigated and unirrigated yields from the *Area and Production of Principal Crops in India*. Since there is only one season for wheat, the problem of deriving one set of yield figures from many, as in the case of rice, was not encountered. As in the rice study there were a few missing observations on yields—Maharashtra in 1970-71 and Bihar in 1983-84. These were filled in by informed guesswork as before. When the corresponding irrigated/unirrigated area and yield figures were multiplied and the results summed up for each of the years under consideration, the output thus derived did not match up exactly with the reported actual total output. This can be seen by the derived to actual output ratios in the annexure. This goes to further substantiate the inaccuracies mentioned earlier in the officially reported yield figures for irrigated/unirrigated acreage. However, the ratios were not so far off as to be unworkable with. Application of the methodology outlined earlier gave the results shown in Table 4.

Base year weighting scheme was used in the component terms on the RHS. As in the rice study, the sum of the component terms did not add up to the LHS due to the inaccuracies in the data and choice of weights used. Use of terminal year weights yielded slightly different numbers but the pattern remained the same.

In the period 1970-71 to 1978-79, at the aggregate level, output grew at the rate of 5.1 per cent pa. Thirty per cent of this increase can be accounted for by growth in new area brought under wheat cultivation and 42 per cent by the shift from unirrigated to irrigated land. The cumulative share of the two yields in explaining output growth is only about 25 per cent (17 per cent on irrigated and 8 per cent on unirrigated land). This is in contrast to the results for rice where the relative contributions of the area and yield components were the other way around. One plausible explanation for this is that the quality of incentives (price, input subsidies, irrigation facilities, marketing, etc) offered to wheat cultivators were not available to rice growers, thus encouraging an area switch from the cultivation of other crops to wheat. Further, this incentive structure combined

with the fact that wheat is grown in the winter (rabi) season (when there is not much rain), hastened the transition from cultivation on unirrigated to irrigated acreage.

Within states, the dominant producers—Punjab, UP and Haryana as well as Rajasthan—reflected the aggregate pattern. Bihar's output growth was largely (40 per cent) due to new area brought under wheat cultivation, while Madhya Pradesh alone showed a dominant contribution (63 per cent) from unirrigated yields. Maharashtra showed the maximum growth rate in output but it should be kept in mind that its contribution to total output is very small (roughly 2 per cent) and that the growth is calculated from a very small base.

Over the period 1978-79 to 1983-84, taking all states together, the noticeable change from the earlier period is the dramatic increase in the irrigated yield component. This reflects the success of the technology extension network which was really taking off in these years. Close to half of the output change of 5.49 per cent pa, is now due to a rise in yields on irrigated land. This increase is at the expense of new area (now down to 20 per cent) and transfer of area from unirrigated to irrigated (now 30 per cent). The contribution of unirrigated yields remains around the same level of about 8 per cent. Among states, the increasing share of irrigated yields is mostly reflected in UP, Maharashtra and Bihar. But, while on the aggregate there is a fall off in both the advent into new area and shift into irrigated from non-irrigated land, Punjab, Haryana and Gujarat do not portray this trend. In the first two, the share of the two area com-

ponents in explaining output growth remained roughly stationary over the two periods under review (58 per cent in Punjab and 78 per cent in Haryana). In Gujarat, on the other hand, the proportion of growth accounted for by the area components nearly doubled from 37 per cent in 1970-71 to 1978-79 to 71 per cent in 1978-79 to 1983-84. Regarding the unirrigated yield component, only Madhya Pradesh again showed significant contribution accruing from it although its share had fallen off as compared to the earlier period (from 63 per cent to 41 per cent).

Repetition of the exercise performed earlier for rice, in leaving out the high achieving states and then looking at the aggregate results did not yield any significant change for 1970-71 to 1978-79 when Maharashtra was dropped. This is understandable in view of Maharashtra's small contribution to total wheat output in the country. Dropping Punjab and Haryana actually raises the aggregate output growth rate, since growth rates in these states were less than the national average.

III

Analysis for 'Trough' Years

To contrast with the analysis for the peak years a similar exercise was conducted for the trough years 1972-73 and 1979-80. If our hypothesis of variations in yields on unirrigated land being the prime cause of variations in foodgrain production were to be true, we would expect to find that from among the four sources of growth we have delineated, the least contribution in the trough years would be from the unirrigated yield component. In fact, this is exactly what the results showed.

The results for both wheat and rice on a point-to-point estimation from 1972-73 to 1979-80 are presented in Table 5. The data compiled as before are in Annexures 3 and 4. Base year weighting scheme is used.

In both cases, taking all states together, the pattern is the same. The 'trough-to-trough' growth rates are significantly less than the 'peak-to-peak' rates. The contribution of unirrigated yields was negative while that of the other three components was positive. For rice, the growth in output was equivalent to growth in irrigated yields whereas growth due to the area components was negated by the fall in the unirrigated yields. For wheat too, unirrigated yields were the only negative source of growth, though the fall in output due to them was much less than in the rice scenario. This is no surprise since rice is grown on a much greater proportion of unirrigated land than wheat is.

Within states a fall in rice output is recorded in Assam, Bihar, Madhya Pradesh, Orissa and Uttar Pradesh—all of which are states with little assured irrigation. These are the places where output falls off drastically in the drought years, leading to instability in production.

unirrigated. On the other hand, for wheat (which depends on rainfall in a different part of the year than rice), failure of the rains would lead to a relatively nominal fall in output since (a) contribution of unirrigated yields to growth is small, and (b) unirrigated area comprises only 25 per cent of total gross cropped area under wheat. The conclusion is that increasing rice productivity through the use of HYVs on unirrigated land has also led to a greater inherent instability in its production.

IV
Conclusions

The overall picture for both crops shows that on a peak-to-peak basis over 1970-71 to 1983-84 the growth rate of wheat output was more than twice that of rice (5.3 per cent pa versus 2.6 per cent pa respectively). A subdivision of this period suggests that between 1970-71 and 1978-79 most of the growth in wheat was accounted for by increases in area sown and a shift from unirrigated to irrigated land whereas growth in rice was largely explained by productivity (yield) increases on both types of land. Between 1978-79 and 1983-84, productivity increases dominated rice growth still further and in wheat productivity increases (limited, however, to irrigated segments) now accounted for half of the growth in output. This increased role of productivity changes in explaining growth highlights the success of the spread of 'modern' technology comprising HYVs, fertilisers research and extension et al. The relatively greater contribution of the area components (both new and transferred) in wheat may be because the quality of the overall package of 'incentives' comprising price support, input subsidies, investment in irrigation, etc, that were afforded to wheat growers were not made available for rice cultivation. These incentives had the dual effect of increasing the area under wheat cultivation at the expense of other crops, as well as encouraging farmers to transfer cultivation from unirrigated to irrigated land. In contrast, a shift out of rice cultivation is indicated in some of the states—Karnataka, Orissa and West Bengal in 1970-71 to 1978-79 and Bihar and Tamil Nadu in 1978-79 to 1983-84.

The trough-to-trough (1972-73 to 1979-80) picture shows the other side of the story. Growth in wheat is 3.8 per cent pa and this is shared by an increase in acreage sown, transfer from unirrigated to irrigated land and increased productivity on irrigated land. There is a fall in productivity on unirrigated land but its total effect on output is small since wheat is grown predominantly on irrigated segments. In contrast, rice grew at a dismal 0.6 per cent per annum mainly due to falling productivity in unirrigated areas. Small increases in the other three components explain the source of this growth.

The analysis provides an insight into the debate on the sources of 'instability in foodgrain production'. An examination of the time series data on wheat and rice production since 1970-71 reveals that the 'instability' has been much more pronounced for rice than wheat. Our analysis provides an explanation as to why this might be so. In the years of good monsoon (the peak years), the contribution of unirrigated yields to rice growth was 25-50 per cent while for wheat it was only 8-9 per cent. Clearly then, the failure of the rains in any given year is going to lead to a substantial fall in rice production from unirrigated land through a decrease in productivity, especially since 60 per cent of gross cropped area under rice is

Small Growers and Co-operative Tea Factories in Nilgiris

V N Reddy
Sharit K Bhowmik

The co-operative factories in Nilgiris have had a positive effect in helping the small tea growers, especially those with very small holdings. At the same time in spite of their financial and technical limitations over the years the small growers have increased the area of their holdings and their productivity. This shows that the small growers have been more enterprising in raising production than the large estates whose production has remained stagnant. The co-operative factories have not only ensured fair prices to their members but also to growers in areas where there are no co-operatives. The bought leaf factories in these areas pay their growers the market prices. They are cautious in lowering prices as they know that this would provoke the growers into joining a co-operative or, when there is none, in forming a new one. Thus the impact of these co-operatives can be felt on all the small growers in this district.

WITH an annual production of more than six hundred and fifty million kg, India is now the world's largest producer of tea. There are at present over four hundred thousand hectares under tea cultivation. Ninety six per cent of the tea is grown on large tea estates owned by joint-stock companies. Most of these estates (especially those with more than 200 hectares) have their own factories for processing green tea leaves into finished products. The remaining 4 per cent is produced by small tea growers.[1] A small grower, as defined by the Tea Board of India, is one whose holding does not exceed ten hectares. These growers are found in the Nilgiris district of Tamil Nadu, the Kottayam and Idukki districts of Kerala and the Kangra district of Himachal Pradesh. The largest concentration of small growers is in Nilgiris. There are 6,258 small holdings registered with the Tea Board which cover 7,678 hectares (ha) giving an average holding of 1.23 ha.[2] The Tea Board has however estimated that the actual number of small growers could be well above this figure as most of them do not register with it.[3] In fact another estimate[4] notes that there are around 20,000 small growers in this district whose holdings collectively account for 12,000 ha. This means that the average holding of a small grower is a mere 0.6 ha. This is the smallest average holding in tea in the country. This paper attempts to assess the problems of small tea growers in Nilgiris and show how co-operative factories have been able to overcome many of these problems.

Emergence of Small Growers

Small growers in this district came into existence around 1920.[5] The large tea estates had then encouraged small farmers in the vicinity to take up tea cultivation. Some of these estates were interested in expanding their area under tea but they were unable to do so because each plantation was granted a specified area of land by the government. They therefore encouraged peasants in the vicinity to take to tea cultivation so that they could supply green leaves to the large plantations. Small growers got a further boost in 1933 when the government introduced the export quota system. The tea industry had faced a severe slump in 1931 as a result of the Great Depression. It was felt that an unrestricted supply of tea to the world market had caused a glut and subsequently a fall in prices. Hence, in order to control this situation, the government decided to regulate exports by granting a quota to each registered tea estate. Small growers too were entitled to this quota though most of them were not in a position to manufacture their own tea. They would hence sell their green tea leaves and their export quotas to the large plantations. Small growers were therefore a help to the large plantations and both were dependent on each other.

However, after 1961 the government decided to suspend the quota system and also agreed to allow large plantations to increase their area under tea. As a result, the larger plantations no longer needed the support of the small growers and their plight deteriorated. Around this time (i e, 1962-63) "bought leaf factories" came into existence in this area and at present there are more than 75 such factories.[6] These are privately owned factories which purchase green leaves from the small growers.

Initially, the prices the small growers realised from the bought leaf factories for their green leaves were very low and they were unable to invest in the improvement of their holdings. Moreover, when there was a mutual dependence of small and large plantations, the former could avail of technical expertise from the latter. Hence, due to lack of funds and the absence of technical assistance, small growers were unable to get the best yields from their holdings. Co-operative factories were set up in this area primarily to help the small growers overcome these handicaps.

Estimates of Holdings and Production

Before examining the problems of the small growers let us try to estimate their number. Both the Tea Board and the Incoserve (which is the apex body of the co-operative tea factories here) have given their estimates of the number of small growers which we have mentioned earlier. We feel that these may be conjectures because, as the Tea Board itself admits, there are no records of the actual number of small growers since most of them are registered as agriculturists and not as tea growers. Our estimate is based on the extrapolation of the breakup in the size of holdings given by the Tea Board along with the manufacture of tea by the co-operatives and the private factories.

A majority of the small growers in Nilgiris sell their green leaves to the co-operative factories or to the bought leaf factories. The present reports indicate that only a fraction of them sell their produce to the large estates. In fact one can assume that growers with holdings upto 50 ha would have to sell their green leaves outside as it would not be economically viable for them to maintain their own tea factories. Moreover the average holding size of growers with holdings between 8+ ha and 50 ha is 13.3 ha. This further strengthens our view that the growers in this group cannot process their green leaves on their own. Therefore we can assume that the total production of bought leaf and co-operative factories more or less reflects the total output of the growers whose holding size is less than 50 ha.

During the year 1976, the total production of tea in Nilgiris district was 3,52,93,000 kg. Out of this 2,00,56,000 kg was contributed by the large tea estates of holding size greater than 50 ha. The remaining 1,52,37,000 kg of tea was accounted by the cultivators with the holding size less than or equal to 50 ha. It may be noted here that the combined total production of bought leaf and co-operative tea factories in 1976 was 1,48,79,000. The per hectare average production of green tea leaves by the small growers in 1976 was 3,556 kgs.[7] Further, the combined proportion of made tea to green tea leaves by the bought leaf and the 'co-operative' tea factories in 1976 worked out to be 0.25.[8] Thus, the average yield of made tea per hectare was 897 kg for the small

growers in 1976. So, the estimated area accounted by the estates of size less than 50 ha in 1976 turned out to be 16,987 ha. We have already noted that the estates with the holding size between 8.09 and 50 ha account for an area of 2,043 ha. Thus the area under tea by the small growers in 1976 turned out to be 14,944 ha. Of this, only 7,678 ha was registered with the Tea Board by the small growers. According to the Tea Board, there were about 15,000 small growers in the Nilgiris district of whom only 6,258 registered with the Tea Board. As such, the

TABLE 1: ESTIMATES OF THE AREA UNDER TEA AND PRODUCTION OF TEA BY THE ESTATES OF SIZE GEATER THAN OR EQUAL TO 50 HA IN THE NILGIRIS DISTRICT

Variable	Year 1976	Year 1985
i) Estimated per cent share in the area under tea by estates of size ⩾50 ha	54.54	57.09
ii) Estimated per ent share in the total production by estates of size ⩾ 50 ha	43.17	45.10
iii) Total estimated area under tea (ha)	31,146	34,004
iv) Total estimated area under estates of size ⩾50 ha	16,987	19,414
v) Total production of tea (000 kg)	35,293	53,806
vi) Estimate production of made tea per hectare (kg)	1,133	1,582

Note: The area under tea by the estates of size between 8.09 and 50 ha were 2,043 ha and 2,138 ha respectively in 1976 and 1985.

average sizes of the holdings of the small growers who registered with the Tea Board and who did not register with the Tea Board were 1.23 ha and 0.83 ha respectively in 1976. Thus, the estimated area under tea in 1976 was turned out to be 31,146 ha, but not 23,879 ha, as reported by the Tea Board.[9] From this, we note that the estimated yield per hectare at the district level turned out to be 1,133 kg but not 1,478 kg, as reported.[10] The percentage of area accounted by small growers of size less than or equal to 8 ha in 1976 was estimated to be 48 whereas their share in the district's production of tea was estimated to be 38 per cent.

According to the Nilgiris Small Tea Growers' Service Industrial Co-operative Society Limited (Incoserve) the average yield per hectare obtained by these small growers was estimated to be 1,250 kg in 1985.[11] During the same year 1985, the total production of tea in Nilgiris district was 5,38,06,000 kg and out of this, 2,95,39,000 kg of tea was contributed by the large estates whose holding size is greater than 50 ha.[12] From this, it follows that the remaining 2,42,67,000 kg of tea was contributed by the cultivators whose holding size is less than or equal to 50 ha. Assuming the same average yield of 1,250 kg per hectare for the holding sizes ⩾50 ha, the area under tea by these cultivators turned out to be 19,414 ha, which means the total area under tea at the district level turns out to be 34,004 ha with 14,590 ha accounted by the large tea estates of size greater than 50 ha.

It must be noted here that among these holdings of 50 ha or less only a small amount was held by growers with holding size of more than 8 ha and below 50 ha. The total area in this holding size group was 2,043 ha in 1976 and 2,138 ha in 1985. In other words, those with holdings of 8 ha and below have increased the area under tea during 1976-85, while those with holdings of 8.09 ha and 50 ha have increased their area only marginally. Thus we find that the small growers in Nilgiris have been enterprising in increasing production of tea by expanding the area under tea and through increasing the per hectare yield rates. The salient features of our calculations are summarised in Table 1.

TABLE 2: DATA ON CO-OPERATIVE TEA FACTORIES TOGETHER WITH THE DATE OF COMMENCEMENT OF PRODUCTION, MEMBERSHIP, AREA COVERED AND PRODUCTION OF MADE TEA PER HECTARE

Sl No	Co-operative Tea Factory	Commencement of Production	No of Members in 1976	No of Members in 1985-86	Area Covered (in ha) 1976	Area Covered (in ha) 1985-86	Production of Made Tea (Kgs) Per Ha in 1976	Production of Made Tea (Kgs) Per Ha in 1985-86

ii) Short notes on the working of industrial co-operative tea factories and the Incoserve: Incoserve, Coonoor, Nilgiris.

CO-OPERATIVE TEA FACTORIES

The need for establishing co-operative factories was first stressed by the Plantation Enquiry Commission in 1956. The commission suggested that factories of this type would increase the economic viability of small growers and would also free them from dependence on large growers and bought leaf factories. Co-operative factories could assure the growers of a fair price for their produce and simultaneously introduce scientific methods of tea cultivation. The first Industrial Co-operative Tea Factory (Indco) in Nilgiris was commissioned in Kundah in 1962 and it was successful.[13] As a result, since 1964, twelve more co-operative factories have been formed.

The thirteen co-operative tea factories produce more than 8 million kg of tea annually which accounts for 15 per cent of the total production of Nilgiris. This makes them "the single largest group of producers in the Nilgiris".[14] These factories have a membership of more than 9,000 small growers who cultivate 7,780 ha of tea land.[15] Their total paid up capital is Rs 32,258,000 of which Rs 13,000,000 is the state's participation. The factories have been started with financial assistance largely from the state government and its financial institutions. The Tea Board and the National Co-operative Development Corporation have offered assistance to some of the factories, though at a later stage.

The Indcos have an apex body known as the Nilgiri's Small Growers Service Industrial Co-operative (Incoserve). This organisation has been set up for providing various services to the Indcos. These include marketing of the tea produced by the Indcos, providing warehouses for stocking tea and, supplying fertilisers, machinery and tea chests to the Indcos.

In order to become a member of an Indco, the grower must reside within its area of operation. The application for membership has to be passed by the board of directors of the Indco. The grower has to purchase shares on the basis of his acreage. The value of each share is Rs 100 and a grower must purchase ten shares for each acre he wants to register with the co-operative. Most Indcos restrict growers from registering more than 10 acres (i e, 100 shares). Initially a grower can join an Indco by purchasing one share. He buys the remaining shares through

instalments which can be deducted from his thrift deposit money. This deduction is done by the co-operatives for encouraging savings among its members. The thrift deposit is usually 10 p per kg of leaves supplied. This amount is either converted as the member's share capital or is kept as reserve for him in case of need.

All but three of the Indcos pay their members on a monthly basis. The procurement prices of green leaves varies between the different Indcos. These prices are fixed at a meeting of the chairman and the managing directors of the Indcos and is presided over by the Joint Director (Tea), Industrial Co-operatives. This meeting takes place in the beginning of each month. While fixing the price of green leaves, the cost of production per kg of tea, average sale price and the allocable surplus of each Indco are taken into account. In addition, the prices paid by the bought leaf factories in the locality are also considered. The grower is usually given a weekly advance ranging from 50 per cent to 75 per cent of the price of green leaves he supplied during the previous month.

The three exceptions to this convention are the Kotagiri, Kilkotagiri and Katabettu Indcos. These three Indcos are situated in Kotagiri taluka and this region has a large number of bought leaf factories. The Indcos have to face stiff competition from these factories and they may have to change their procurement prices frequently. Hence these Indcos are allowed to fix their prices on a weekly basis and their members are paid their full amount on every Saturday.

Each Indco is managed by a board of directors comprising 15 members. Twelve of them are elected by the members of the co-operative and the other three are nominated. They are representatives of the Tamil Nadu Co-operative Bank, Tea Board and the managing director of the co-operative who is an official in the industrial co-operative department. The managing director is nominated by the registrar of co-operatives and the other two members are nominated by their respective organisations. The directors elect the chairman and the vice chairman of the board.

The term of each board is of three years. The twelve elected members of the board are elected by an electoral college consisting of members of the co-operative who have been supplying green leaves regularly for at least three months prior to the elections. This condition usually decreases the voting strength by half or one-third of the total membership of the co-operative. It was also found that the voting in the elections is fairly high; around 80 per cent or more of the electorate cast their votes.

The bye-laws of the Indcos make the general body of the members the ultimate authority of the co-operatives, subject to the provisions of the Tamil Nadu Co-operative Societies Act 1961. The board of directors is vested with the executive management of the co-operative. The chairman has the general control over the affairs of the co-operative while the managing director is responsible for its administration. The managing director is also the ex-officio treasurer of the co-operative. In effect, the managing director who is a nominated member is the executive authority and the board the appellate authority.

It should be noted here that the Indcos have had elected bodies only since 1983. Prior to this, the members of the board were nominated from among the members of the co-operative by the registrar of co-operatives. Even now there are three Indcos which have nominated boards.

Performance of the Indcos

The basic objectives of the co-operati[ve] tea factories are to provide remunerati[ve] prices to small growers for their leaves an[d] to prevent middlemen from exploiting the[m.] The middlemen in these areas are known a[s] leaf agents. These people give cash advance[s] to the small grower and later buy his cro[p] and charge a commission to sell it to a fac[-]tory. These agents can be found in areas hav[-]ing a large number of small growers bu[t] where there are no co-operative tea factories. In Nilgiris these agents are almost non[-]existent thanks to the co-operatives.[16] B[y]

NOTICE

It is hereby notified for the information of the public that **Aftaab Investment Company Limited** proposes to give to the Central Government in the Department of Company Affairs, New Delhi, a notice under sub-section (1) of section 21 of the Monopolies and Restrictive Trade Practices Act, 1969, for substantial expansion of their undertaking. Brief particulars of the proposal are as under:

1.	Name and address of the owner of the undertaking	:	**Aftaab Investment Company Limited,** Bombay House, 24, Homi Mody Street, Fort, Bombay 400 001
2.	Capital structure of the owner organisation	:	Rs. Authorised Share Capital: 25,000 Equity Shares of Rs. 100 each: 25,00,000 Subscribed and Paid-up-Capital: 24,800 Equity Shares of Rs. 100/- each: 24,80,000
3.	Location of the unit or division to be expanded	:	The location of the division is at Bombay—at the address mentioned above.
4.	In case the expansion relates to the production, storage, supply, distribution, marketing or control of goods, indicate: (i) Name of goods (ii) Licensed capacity/turnover before expansion (iii) Expansion proposed	:	Not applicable
5.	In case the expansion relates to any service, state the extent of expansion in terms of usual measures such as value, turnover, income etc.	:	It is proposed to expand leasing business from Rs. 50 lakhs to Rs. 300 lakhs, in terms of money value.
6.	Cost of the project	:	Approximately Rs. 300 lakhs
7.	Scheme of finance, indicating the amounts to be raised from each source	:	Internal Sources Rs. 100 lakhs Borrowings from Financial Institutions, Commercial Banks and Privately placed debentures Rs. 200 lakhs

Any person interested in the matter may make a representation in quadruplicate to the Secretary, Department of Company Affairs, Government of India, Shastri Bhawan, New Delhi, within 14 days from the date of publication of this notice, intimating his views on the proposal and indicating the nature of his interest therein.

AFTAAB INVESTMENT COMPANY LIMITED,

(N.S. SUNDER RAJAN)
DIRECTOR

Dated this 26th day of September 1989

providing growers fair prices and also ensuring that their remuneration does not fall too low, the co-operatives act as a check on the bought leaf factories from lowering their procurement prices. Had the co-operatives not been there it was possible for bought leaf factories in an area to form a consortium and fix low prices.

The co-operatives also supply chemical fertilisers to the growers at subsidised rates. This is one facility which none of the bought leaf factories can provide. These factories too supply fertilisers to their growers but at market rates. The co-operative factories are expected to provide technical assistance to the growers, though at the time of this study most of the factories did not have the requisite personnel for this purpose. Some of the factories maintain plant nurseries, the cuttings of which are distributed to the members at nominal prices. There are two other organisations which are expected to help small growers improve their yields. These are, the Tea Board, which has its regional office at Coonoor, and the Krishi Vikas Kendra (KVK) which is financed by the ministry of agriculture and is maintained by the United Planters Association of South India (UPASI).

The performance of the co-operative factories in Nilgiris can be judged from the size of membership and from the continuity and expansion of their economic activity. While determining the latter we can take into account the production of tea by those factories and the area under tea of the members belonging to the co-operatives. Table 2 gives us the data on these aspects for twelve of the factories. The thirteenth factory was under construction at that time. The data is for the decade 1976 to 1985-86. We can see that the total membership has increased from 3,853 in 1976 to 8,983 in 1985-86. This indicates that the membership has increased by around two and a half times during this period. The membership figures for each of the co-operatives show that except Kilkotagiri, all co-operatives which were established before 1976 have increased their membership over the decade. In fact three of them, namely Kundah, Majur and Gudalur, have more than doubled their membership.

The tea growing area covered by each co-operative has, with the exception of one, increased over the decade. The total area covered by the twelve co-operatives in 1976 was 3,863 and in 1985-86 it was 7,163. One can also notice in the table that the increase in membership is more than the increase in the hectares covered by the co-operatives. For instance, 5,130 new members joined the co-operatives between 1977 and 1985-86 but the additional area increased by only 3,300 hectares. We find this trend when we take into account each co-operative. In fact we will find that three of the co-operatives (Kundah, Majur and Gudalur) which have increased their membership by over 100 per cent have increased the area covered for the same period by less than 40 per cent. This obviously indicates that most of the new members have holdings of less than one hectare each. The per capita landholdings in the co-operatives have decreased from a small fraction over one hectare in 1976 to 0.8 hectare in 1985-86. If we consider each co-operative separately we find the same trend. Of the nine co-operatives set up before 1976 only Ithalur had a per capita holding of less than a hectare while all others had more than one hectare. In 1986 we find that the per capita holding of each of these co-operatives has fallen to less than one hectare. Of the three new co-operatives we find that the per capita holding of only one, Salisbury, is over one hectare while the other two have average holdings of 0.8 hectare. This clearly indicates that apart from steadily increasing their membership, these co-operatives have been able to draw more of the weaker section of the growers into their fold. On comparing the data at the district level we find that during the decade 1976 to 1985-86 membership has increased by 133 per cent, area covered by 85 per cent and production of made tea per hectare by 12 per cent.

We have taken the production of processed tea by the co-operative factories as another indicator of their performance. The last column in Table 3 gives us the average production of tea per co-operative factory for the period 1964 to 1985-86. We can see that the average production per factory has increased more than five times during this period i e, from 1,31,000 kg in 1964 to 6,73,000 kg in 1985-86. This indicates that the factories have been increasing their production steadily over the years. At the same time, we can see from Table 2 that the production of tea per hectare has also increased. The figures in these columns have been derived by taking the total production of each factory and dividing it by the area covered by the factory. The increase in the per hectare production of tea over the decade 1976 to 1985-86 for all co-operatives except Kilkotagiri, means that the output of the growers has increased. A higher per hectare production can be achieved only if the growers supply larger quantity of leaves to the factory. However, it should be noted here that in calculating the figures in Table 2 we have assumed that the members have supplied their entire crop to their respective co-operative factories. However very few of the Indcos have all their members supplying their entire crop. Hence, had all members actually supplied their entire crop to the co-operatives the production of tea per hectare would have been even higher.

The above findings indicate that the co-operative factories in Nilgiris have been expanding their activities. We have summarised some of the findings in Table 3 where, the members, area covered, green leaf purchased and tea produced are shown. These are averages per co-operative factory. The figures indicate that the co-operatives have expanded their activities in each of the four areas.

Let us now examine how the growers have benefited. The main benefit for the growers is in being assured of a fair price for their leaves. We have noted in the earlier section that the prices for green leaves are fixed by the co-operatives not merely on the basis of the existing market forces but by taking into account the cost of production, allocable surplus, etc. Better prices would also mean an increase in the revenue of the small grower. In Table 4 we can see that the revenue

u Output of made tea per factory (tons)	431	654	673
v Auction price per kg of made tea (Rs)	8.47	23.55	13.64
w Per cent cost of green tea leaf in the production per kg of made tea to the sale price per kg of made tea	61	84	80

per hectare for the small grower (last column) increases or decreases with the average price realised by the Indcos for their tea. When the price falls (as in 1986) the revenue of the small grower also falls. The price of tea realised by the Indcos also determine the price paid to the small grower for his green leaves.

The important point here is that the Indcos have passed on a major portion of the price of tea to the small grower in terms of leaf price. The second column in Table 4 shows the price paid to the growers by the Indcos for 1 kg of green leaves. The third column indicates the amount the grower received for 1 kg of made tea produced by the Indcos. The figures in brackets in the third column shows the percentage of the price of made tea given to the small grower. For instance, in 1964 the Indcos sold their tea at Rs 5.19 per kg and they paid the small grower Rs 3.25. This accounts for 62 per cent of the price of tea realised by the Indcos. We can also see that as the price of tea increased the proportion paid to the small grower increased to 80 per cent. In the large privately owned tea estates in Assam and West Bengal the wages of the workers engaged in plucking of green leaves account for only 35 per cent of the total cost of production and 30 per cent of the price of tea. By giving the small grower 60 per cent to 80 per cent of the price of tea, the Indcos have infact transferred a major part of their income to the growers. The Indcos have thus tried to ensure that the growers get remunerative prices. One must take this into account while discussing the profit or loss of the Indcos.

Comparison of Small Growers and Large Estates

We have summarised the important growth indicators of the Nilgiris tea industry in Table 5. During the last decade, tea production in the Nilgiris district has witnessed an annual increase of about 3 per cent. The share of the large tea estates in the production of tea has remained stagnant around 57 per cent whereas their share in the area under tea has indicated a downward trend from around 45 per cent in 1976 to 43 per cent in 1985. The number of large tea estates has remained practically the same between 1976 and 1985 but their average holding has increased by 5 per cent. This means that the large tea estate owners have consolidated their holdings. We can also see that even though there was a fall in the number of estate factories the production of made tea per factory has increased over time.

The small growers on the other hand have increased in number while the size of their holdings has decreased. Their productivity too is much lower than that of the large estates though the yield per hectare has increased. In 1976 the production of made tea per hectare was 897 kg for growers with holdings of 50 ha or less whereas it was 1,418 kg for estates holding more than 50 ha. The corresponding figures for these two size

classes in 1985 were 1,250 kg and 2,025 kg respectively. For members of the co-operative tea factories the relevant figures were 1,004 kg and 1,127 kg for the respective years. The lower figure for 1985 as compared to that of all small growers could be because the members did not give their entire crop to their co-operatives.

In the case of large tea estates, there was a spectacular rise (more than three-fold) in the revenue per hectare of tea production in 1984 over 1976. With about 22 per cent fall in the auction price in 1985 (over 1984) the fall in the revenue was about 15 per cent. In the case of small growers also, there was a spectacular rise (more than four-fold) in the revenue per hectare of green tea leaf production in 1984 over 1976. However, with about 44 per cent fall in the purchase price of green tea leaf in 1985 compared to 1984, the fall in the revenue per hectare of green tea leaf production was 45 per cent. Thus unlike in the case of large tea estates the revenue per hectare for the small growers of tea was elastic with respect to the purchase price of green leaves.

It may appear from the above facts that the small growers have not been able to increase productivity even though they have been assured fair prices by the co-operatives. Thus the co-operatives have helped in increasing revenue but not production of the small grower. This is not necessarily correct. The small growers need other kinds of support apart from the assurance of fair prices. The number of tea bushes per hectare is low. The Tea Board estimated that in 1976 the number of bushes per hectare was 5,144 whereas for the large estates the figure was 8,000. With such a low bush population the small grower is not able to obtain the optimum yield. Moreover the existing bushes are old and need to be replaced or rejuvenated. This entails a lot of expenses and also time. A new tea bush takes atleast five years to reach its optimum yield and during the first three years it does not bear leaves. A rejuvenated bush takes two years to bear its average yield. Large estates are able to phase out their replacement or rejuvenation schemes but for a small grower it would mean no income for a few years. Therefore these people need subsidies and grants or loans to overcome their lean period. The Tea Board has a scheme for providing replantation, rejuvenation and pruning subsidies to small growers (in fact even the large estates are entitled to such subsidies) but it has been able to service a very small section of growers. A survey of 172 members of one of the co-operative factories showed that only three of them had received replanting subsidy from the Tea Board and 38 of them had got pruning subsidy. The co-operative on the other hand has been able to supply 138 of these members with fertilisers, pesticides and cuttings. Thus while the co-operatives have in their own way been able to help the small grower, the impact of the other agencies such as Tea Board and Krishi Vikas Kendra has been almost negligible.[17]

Summary and Conclusions

We have tried to show that the co-operative factories in Nilgiris have had a positive effect in helping the small tea growers, especially those with very small holdings. At the same time in spite of their financial and technical limitations over the years the small growers have increased the area of their holdings and their productivity. This shows that the small growers have been more enterprising in raising production than the large estates whose production has remained stagnant. The co-operative factories have not only ensured fair prices to their members but also to growers in areas where there are no co-operatives. The bought leaf factories in these areas pay their growers the market prices. They are cautious in lowering prices as they know that this would provoke the growers into joining a co-operative or, when there is none, in forming a new one. Thus the impact of these co-operatives can be felt on all the small growers in this district.

The main drawback of the co-operative factories is that they have been consistently fetching low prices for their tea (see Table 1). This has to some extent affected the revenue of the small grower. This problem can be traced to the management of the Indcos. Though they have elected bodies, the chief executives (managing directors) have effective power. The incumbents to these posts and the next one of Industrial Co-operative Officer, are not technical people as neither of them have qualifications which make them conversant with the intricacies of tea manufacture. A sound knowledge of tea manufacture is very essential because the price of tea depends on its quality. Good quality green leaves can be turned into inferior quality tea if they are not processed properly. The co-operative factories in Kangra district of Himachal Pradesh are aware of this problem. The four tea factories there are headed by technically qualified managers who have undergone training at the Tea Research Institute in Jorhat, Assam. The managers are appointed by the respective boards of directors. The state government does not insist in appointing its nominee as the chief executive. As a result the price of Kangra tea has been steadily increasing in the Calcutta auctions. In fact for the past few years tea produced at the Palampur co-operative factory has been fetching over Rs 100 per kg in the beginning of the season (March).

Apart from this, the growers need to be provided more inputs and subsidies. Of the existing agencies in operation only the Indcos have been able to service the largest number of small growers so far. The records of the Tea Board and the KVK have been dismal. The latter in fact operates through UPASI. Its technical stations and plant nurseries are manned by UPASI which in turn is expected to provide benefits to the growers. UPASI largely represents the interests of the large estates and is unlikely that it will enthusiastically cater to the interests of the small grower.

The Tea Board has its own office at Coonoor and its staff are expected to liaison directly with the individual grower. The Tea Board obviously has its limitations here because of the vast area to be covered and the large number of small growers therein. In such a situation the Tea Board can easily take the help of the co-operatives in performing its development activities. While providing subsidies to the large estates the Tea Board operates through the associations of the planters such as Indian Tea Association, Tea Association of India, etc, in North India and UPASI in South India. Why can it not operate through the co-operatives while catering to the small grower? In fact both KVK and Tea Board should collaborate with the Indcos in their activities. The Indcos have the widest and most regular contacts with the small growers and this can be usefully exploited for achieving an integrated development of this vast section of farmers in the district.

Notes

[This paper forms a part of a study on co-operative tea factories and small growers in Nilgiris which was sponsored by the Centre for Management and Development Studies, Indian Institute of Management Calcutta. The authors are grateful to T Shankarnarayanan, J I Doraiswamy, T S Kenga Gowder, T K Mathan, T J Shivan and K Ari for their help during the field study.]

FORM II-A

Form of general notice to be given to the members of the public before making an application to the Central Government under sub-section (2) of Section 22 of the Monopolies and Restrictive Trade Practices Act, 1969.

NOTICE

It is hereby notified for the information of the public that FORBES FORBES CAMPBELL & CO. LTD., BOMBAY proposes to make an application to the Central Government in the Department of Company Affairs, New Delhi, under sub-section (2) of Section 22 of the Monopolies and Restrictive Trade Practices Act, 1969, for approval to the establishment of a new undertaking/unit/division. Brief particulars of the proposal are as under:-

1. Name and address of the applicant	: FORBES FORBES CAMPBELL & CO LTD, Forbes Building Charanjit Rai Marg Bombay-400 001.
2. Capital structure of the applicant organisation	: Equity / Unclassified
Authorised Capital	484,00,000 / 10,00,000
Issued, Subscribed and Paid-up Capital	424,96,520 / —
3. Management structure of the applicant organisation indicating the names of Directors, including 'Managing' wholetime Directors and Manager, if any.	: Dr. F.A. Mehta—Chairman & Managing Director Mr. N.A. Soonawala—Vice Chairman Mr. F.H. Kemple Mr. D.J. Madan Mr. K.S. Gaekwar Mr. D.B. Engineer Mr. S.P. Mehta Mr. A. Hydari MR. G. Das Mr. D.S. Parekh Mr. D.N. Poonegar—Jt. Managing Director Mr. D.S. Soman (Alternate to Mr. F.H. Kemple)
4. Indicate whether the proposal relates to the establishment of a new undertaking or a new unit/division.	: New article
5. Location of the new undertaking/unit/division	: In the existing factory at Chandivali, Bombay, Maharashtra State
6. Capital structure of the proposed undertaking	: There will be no change in the capital structure
7. In case the proposal relates to the production, storage, supply, distribution, marketing or control of any goods/articles, indicate:	:
(i) Name of goods/articles	: Cutting Tools e.g. Milling Cutters, Reamers, Drills etc.
(ii) Proposed licensed capacity	: 4,00,000 nos. per annum
8. In case the proposal relates to the provision of any service, state the volume of activity in terms of usual measures such as value, income, turnover, etc.	: Not applicable
9. Cost of the project	: Estimated cost of machinery only Rs. 20 lakhs. All other facilities already exists
10. Scheme of finance, including the amounts to be raised from each source.	: Required funds are proposed to be met from internal resources/IDBI Bill Discounting Scheme

Any person interested in the matter may make a representation in quadruplicate to the Secretary, Department of Company Affairs, Government of India, Shastri Bhavan, New Delhi, within 14 days from the date of publication of this notice, intimating his views on the proposal and indicating the nature of his interest therein.

Dated this 21st day of August 1989

for FORBES FORBES CAMPBELL & CO LTD.

Entrance System for Elimination

M Shatrugna

The entrance examination as the sole basis of selection for post-graduate courses is illogical and meaningless. By conducting such examinations universities are dishonouring their own first degrees.

ENTRANCE tests for professional courses like engineering, medicine and agriculture have become a regular feature in Andhra Pradesh. The main purpose of conducting an entrance test is to select the best among the applicants for the concerned course. But what started as a test to select has now become a test to eliminate. An entrance test of the type we conduct today need not necessarily select the best among the candidates, if the type of question papers used at present is any index. Within the three hours that decide his future the suitability of a candidate to enter a professional college is tested. The performance at the intermediate level is no criterion for getting a seat in the professional courses. A perusal of question papers set at the Engineering, Agriculture, Medicine Common Entrance Test (EAMCET) of Andhra Pradesh for the last few years reveals that the questions are framed in such a way as to make them more difficult each year. At the recently held EAMCET in AP where about 70,000 candidates appeared for 5000 seats, not more than 45 per cent of the applicants were eligible for the various courses. In the same examination, it was generally agreed by all that mathematics paper was very tough. The highest score was only 31 marks out of 50. This is something unprecedented. A number of candidates who had scored more than 95 per cent at the intermediate level in mathematics this year could not score more than 60 per cent at the entrance test. This signifies that either the intermediate standard is very low or the entrance standard is unusually high.

It may be assumed that the standard, syllabi, etc, at the intermediate level are quite high as they are set by senior professors and experts in the field. It then means that the standard of the EAMCET is set very high keeping in view the so-called IIT standard. Generally, the standard of the examination should be slightly higher than the intermediate standard. Thus in order to ensure competence at the EAMCET, the standard of syllabus at the intermediate level must be upgraded. Is the government prepared to do that? If it cannot, the type and style of setting papers at the EAMCET must be radically altered keeping in view the intermediate syllabus. Secondly, the syllabi of various courses up to the intermediate level are 'essay' oriented and not 'problem' oriented. Thus, a candidate schooled in the 'essay type' system for 12 years is suddenly asked to solve the 'bit type' question paper at the entrance examination. Hence a ridiculous situation exists where a candidate is penalised without cause. The 'bit-type' question model at the entrance examinations has given rise to other problems.

Now in Andhra Pradesh, as perhaps elsewhere, a number of coaching centres have come up, taking advantage of this system which switches suddenly from the essay type at the intermediate level to bit-problem type at the entrance test. The tremendous popularity of these coaching centres is seen in the multicrore business transactions of these centres. Interestingly these coaching centres are primarily run by teachers and lecturers who work in colleges. While the commitment of these lecturers towards students cannot be doubted, the commercialisation of education by such people is condemnable. Apart from the fact that they evade taxes and escape the provisions of MRTP Act, they have succeeded in converting education into a trade. The failure of the teaching community in general and professional teacher bodies like AIFUCTO in condemning the unprofessional conduct and trade practices of a section of the erring teachers has shocked the conscience of genuine teachers and has brought down the esteem of teachers in the eyes of the society. It is significant to note that there were no such coaching shops 20 years ago as there were no entrance tests then. Even assuming that there is a tremendous rush for professional courses now, a more rationale and scientific method must be involved to select the better candidates.

Regarding selection at the post-graduate courses like MA, M Com, MBA and M Sc, it can be said that the whole procedure is irrational and clumsy. The sole basis of selection is performance at the entrance test. This is most illogical and meaningless and all universities must share the blame for this. For instance by conducting an entrance test at the post-graduate level, universities are dishonouring their own first degrees. Added to this is the singular importance accorded to performance at the entrance examination. The standard argument that an entrance test evens out and standardises the perfo mance for selection is untenable. Th syllabi, valuation, etc, for a course ar uniform in a particular university. Th scope for malpractice is also limited a centres are changed for candidates ap pearing for the examinations. Eve assuming that there would be non uniform evaluation by individual teachers what we need is a change in the mode o examination system at the intermediat and degree levels. This particular tas demands more innovation and courage o the part of the educationists and senio professors who run our colleges an universities. Instead of tackling thi problem, the universities have take recourse to easier methods like 'entranc examinations' where elimination is mad in a 'respectable' manner.

Apart from the above mentioned facts, an entrance test pressurises the student mentally. Learning and studying should be a pleasant process. The entrance system subjects young people to tremendous tension and pressure. The psychological and mental costs of this irrational system should be evaluated by the educationists and the society in a serious manner. The present system also goes against the interests of the weaker sections of the society like SC and ST, BCs and women who generally have no access to private coaching institute as they are very expensive. Speed is one of the ingredients in the present system. It is scientifically questionable whether this quality is the sole indicator of intelligence. The argument that the best will be selected by this system has no basis in facts. None of our scientists who had made a mark in various fields in the last four or five decades had appeared for any 'entrance test' at the first or second degree level. This is because the earlier system never eliminated any, the way the 'entrance' does at present. Even if someone failed in the earlier system, this happened after two years of study, unlike in the present three-hour entrance test.

Yet another aspect of the present system is that teachers and lecturers who are dealing with intermediate classes are not consulted on the suitability of the system. At best the system is governed by a few senior professors who are not personally in touch with the intermediate syllabi. This is a very dangerous trend undermining the democratic aspect of our educational set-up.

Ethnic Indians in Malaysia

T G Ramamurthy

A clear indicator of the economic status of the Malaysian Indians is the fact that despite constituting nearly 10 per cent of the population, their share of the corporate wealth of the country is less than one per cent.

A CURSORY survey of Malaysian society, particularly the urban centres may well create the impression that the ethnic Indians represent yet another instance of the success story of overseas Indians. The presence of apparently affluent ethnic Indians, seeming to dominate the professions, especially in Kuala Lumpur, is striking. In political participation too their profile is high—claiming one cabinet minister, two deputy ministers, a deputy speaker and several other high functionaries. The validity of such an impression may however be empirically unsustainable. Questions certainly arise regarding their numerical strength and affluence and the extent of their integration with the larger society.

Malaysia, a federation of 13 states (nine sultanates and four former settlements—11 in peninsular Malaysia and two in eastern Malaysia on the island of Borneo) is comparatively affluent in third world terms, with a per capita income of approximately US $ 2000. The annual GDP growth averaged at 8.5 per cent during the first half of the 1970s, declined to an average of 5.8 per cent during the first half of the 1980s and almost touched the zero growth rate in 1986 but has since recovered due to considerable foreign investment induced by more favourable terms than are available for domestic investments. The Malaysian economy is dependent on export of primary products which include petroleum and natural gas, rubber, palm oil, tin, timber, spices, etc. The variety of primary products ensures, generally, that the ups and downs in the world market are balanced out. In the unfortunate event of all the major primary products touching a low as happened in the early eighties, the economic outlook becomes dismal leading to a disturbed political climate—the well known indicator of growth without development.

Economic Status

The Malaysian Indians share this hollowness of the country's growth. In colonial times during such depressions as brought about by a decline in rubber and tin prices, the Indians were repatriated or encouraged to emigrate in large numbers. That possibility having been eliminated since the independence of India first and of Malaysia later, the Indians are left to fend for themselves, mostly by migrating to urban centres, where they eke out a living in the unorganised sector. These Indians have to be kept in mind when assessing the status of the Malaysian Indians. The Indians are neither as ubiquitous nor as affluent as the urban Indian would impress. In a population of more than 15 million the Indians number some 1.3 million and have a territorially uneven distribution, with the currently prosperous eastern Malaysia and peninsular Malaysia being practically devoid of Indians. Even where they are concentrated, as in the west coast states, they are so widely dispersed that they do not form a vote bank in any of the parliamentary or state assembly constituencies. The urban Indian, most visible to the visiting Indian from the mother country is indeed affluent (even if some flaunt their affluence especially for the benefit of the cousin from India) but he is not the typical Indian, not even the typical urban Indian. Almost 70 per cent of the urban Indians are workers—industries, informal sector, domestic service, etc. Most of them earn less than M$ 350 per month while the rural plantation Indian earns an average income of around M$ 200 inclusive of rations. A clear indicator of the economic status of the Malaysian Indians is the fact that, while they constitute nearly 10 per cent of the population, their share of the corporate wealth of the country is less than 1 per cent. The average income and consequently their capacity to save and invest may be gleaned from the fact that despite considerable endeavour the Malaysian Indian Congress (MIC) could manage to raise only M$ 100 million for a multi-purpose financial trust, patterned on the Unit Trust of India, with a view to increase the community's capital share. For the Indians, who have little control over any financial institutions in the country and have no participation in the manufacturing or industrial sectors this is the only corporate holding company. Even in the plantation sector with which the Indians have been associated as 'labour' their ownership is limited to a few co-operative holdings. Indians have not been able to benefit from schemes designed to encourage small farmers and plantation-holders, largely due to incapacity to save.

Here again, the Malaysian Indian shares the general features of the country's economy. Poverty in Malaysia cuts across ethnic divisions and occurs in the urban as well as the rural sectors. Naturally, the incidence is higher in the rural than in the urban areas. In 1984, 24.7 per cent of the rural households were below the poverty line as against 8.2 per cent of the urban households. In the country as a whole 35.1 per cent of the households were deemed to be poor. Among Indians, 27.3 per cent of households were below the poverty line as against 17.4 per cent of Chinese households and 46.4 per cent of Malay households.

The paradox of poverty in an apparently affluent country is explained by the fact that the bottom 40 per cent of the Malaysian households received only 7.7 per cent of the total income while the top 20 per cent received as much as 56.1 per cent. In 1984, the rural household income was exactly half of the urban household. This picture of the economic status of the 'Indian' Malaysian, dismal as it seems, has its brighter aspect, for unlike his brethren in east Africa, the Indian in Malaysia is not seen as an exploiter (the moneylending class/caste of Indians fled the country almost en masse after the May 1969 racial riots). Current rivalry between ethnic communities is largely between the Malays and the Chinese for the control of the economy. Such rivalry as exists between Indians and Malays concerns mostly employment in the public sector and in the educational field, both in regard to opportunities for higher education and in respect of academic employment, which could perhaps even out once the current emphasis on more-than-due share for Malays to redress past imbalance slackens.

Currently, no doubt, the disabilities felt by the Indians in education and employment are quite acute. In the field of higher education, the Indians do not get anywhere near their legitimate share notwithstanding claims made by the MIC. In particular, the Indian student is certainly discriminated against in the matter of admission to professional courses. The cumulative effect of this discrimination on the future economic status of the community can be easily gauged.

This, however, is a problem that affects mainly the urban middle class. The urban elite manages to send children abroad for higher education—to UK, Australia, USA or India. The urban and rural working classes hardly cross the middle school and the luckier and more determined ones make it to the higher secondary stage which promises them a fair share in low level employment for which the competition from the Malay community is not that severe or propped up. In the matter of employment in the superior services, there is palpable discrimination. Representation in the police, defence services and other security-related agencies is being reduced to practically nothing.

Political Participation

So, the 'success story' appears to narrow down to the political field, where, the 'Indian' participation is fairly 'high profile'. How stable is this political partnership? What is the basis of this participation? Will it last and how long? The MIC is and has been a major partner in the communal alliance which has ruled the country since independence, the other partners being the United Malays National Organisation (UMNO) and the Malaysian Chinese Association (MCA). Presently the alliance comprises, besides these three major communal parties, several smaller, non-communal or regional parties like the Gerakan based in the western coastal states of peninsular Malaysia, the Sabaah United Party (Parti Bersatu Sabah) of the state of Sabah in eastern Malaysia and the Sarawak United Front, all of them collectively called the Barisan Nasional (BN) or the National Front. The BN since 1974, like the Alliance before 1969, is based on the 'politics of accommodation', arrived at by the major communities involved as a precondition to independence.

The 'politics of accommodation' involved acceptance of the political primacy of the indigenous Malay community by the two major immigrant communities—the Chinese and the Indian—in return for the right to full citizenship, with all its privileges and duties. One of the ways in which the political primacy of the Malay community was underpinned was the entrenchment of the Malay royalty not only in the nine sultanates but also, through a unique institution of 'elected monarchy' at the federal level, where the sultanates and the settlement states accepted, as head of state, a king (Yang di Pertuan Agong) elected by and from among the nine sultans and rajas. As a further entrenchment of Malay political primacy, Islam is the official religion of the federation, though freedom of worship is guaranteed, under the constitution, to followers of other faiths. The major contenders for power, political or economic, at the time of independence, were the Malays and the Chinese, the Indians being interested mainly in citizenship as a guarantee for freedom of residence and vocation. The Chinese acquiesced to the political primacy of the Malays since they were essentially interested in the levers of economic power. It was rather fortuitously that the Indians came into the bargain, when in the later forties and early fifties, the elite leadership gave way to 'grassroots' control of the MIC and the party opted to go along with the Malays and later to join the alliance.

One of the consequences of the emergence of the BN, under a new 'social contract', so to say, was the gradual take-over of the levers of economic power by the Malays through such 'agreed' policies as the New Economic Policy and increasing state control of economic activities. This was made possible by a combination of factors. For one thing there was the fear of the repetition of the communal riots of May 1969 (the bogey is raised whenever necessary to curb Chinese irredentism, as happened in 1987). For another, the MCA was steadily losing ground among the increasingly urbanising Chinese who preferred to support non-racial 'democratic' parties. As a result, the MCA began increasingly to depend on the UMNO to win elections and hence was in no position to 'bargain from strength' within the BN. One sure indication of this was the loss of the finance and commerce portfolios by the MCA to the UMNO. The UMNO, on the other hand, has managed to increase its hold on political levers by gerrimandering as well as with the help of the constitutional weightage given to rural constituencies.

The Indian partnership in the political bargain has been not only fortuitous but practically passive as well. Devoid of economic power, the community also lacks political clout in the absence of any 'Indian constituency' as such. At best, Indian votes could tilt the balance in favour of the marginal winner in a few constituencies where the 'Indian' vote comprised a little over 15 per cent of the rolls. Thus, as an 'honoured' member of the BN, the MIC has been less capable than the MCA to 'bargain from a position of strength'. The MIC accepts seats to contest, constituencies to post its nominees, seats and portfolios in the council of ministers, largely as a concession by the majority community and in the context of that community's rivalry with the Chinese. Indeed, the Indians, has stood to gain marginally in the rivalry between the Malays and the Chinese. Theoretically, its porportionate share in the country's economic cake is acknowledged, though in practice it has not benefited fully, nor is it likely to. For, ironically, the better the economic status of the community, the lower its value as an ally to the majority community. The 'Indian' voter in the rural constituencies is part of the vote bank for the partnership. But the urban Indian is a different proposition. He exercises his choice more often than not, against the partnership. Thus, the MIC's avowed pledge to change the image of the community turns suicidal, because the MIC's ability to deliver the Indian vote diminishes in direct proportion to the degree of urbanisation. The urban worker, more so if he is in the unorganised sector, has to reckon not only with inadequate wages but also insecurity of tenure made worse by the lack of any social status and the absence of community support. Indeed, he is even worse off than those left behind in the plantations. He looks at the problem differently

and tends to be less communal and shies away from the ruling partnership of communal parties. In his eyes, the 'politics of accommodation' (which no doubt ensured the stability of the polity to a great extent) looks increasingly like a system of spoils, in which, he has little or no share. Further, the competition with the Malays becomes more palpable in the urban context and the marginal value of the 'politics of accommodation' to the Indian seems no longer perceptible. The fact that, whereas for the elite Malays the rivalry is with the Chinese rather than with the Indian, in the case of the aspiring majority the rivalry is more immediately with the 'Indian', who is also aspiring for a new status, accentuates the frustration with the 'politics of accommodation' pursued by the leadership. To a certain extent, the disappointment with the 'politics of accommodation' is shared by the Malay also, although he starts the race with many advantages in the form of government encouragement through *bumiputra* quotas. Education and training and the mobility through these only heighten the competition in an urban setting. Like the Indian, he also senses something wrong with the system of spoils.

The skewed income differential and the prevalence of poverty, which, cuts across communal lines, brings home the point that the 'politics of accommodation' has enabled some Malays, some Chinese and some Indians to come together to appropriate a large part of the national wealth. At the same time the political climate prevents, or at least inhibits, interaction amongst Malays, Chinese and Indians. The growing awareness of this state of affairs should normally lead to a rejection of communal politics and to the emergence of non-communal parties. Indeed, the Gerakan, based in Penang and Perak, emerged as a challenge to communalisation of politics and its success in the 1968 general election was a contributory factor in the communal riots of May 1969. The gathering strength of the non-communal Democratic Action Party (DAP) in the 1987 elections, when for the first time the lower house of parliament had a strong opposition contingent of 24 in a house of 175 led eventually to near repetition of 1969.

Several factors work to deflect the emergence of non-communal politics. For one thing, such politics has always been associated with the Chinese, who are seen to have a vested interest against communal politics which has benefited the Malays. There is also the historic association of the Chinese with the banned Communist Party and non-communal politics tends to raise fears of communist revival. The internal rivalries among the Chinese tend to vitiate the competition between communal politics as represented by the MCA and non-communal politics as symbolised by the Gerakan before 1974 and more truly reflected in the DAP in the eighties. The Gerakan, after joining the BN, became a rival of the MCA and increasingly became a Chinese-based party rather than a non-communal party. In the case of the Malays, Islam has been a potent factor in inhibiting the emergence of non-communal politics. The Malay tends to assert his Islamic identity in self-defence. The fresh arrivals in urban centres, if unable or unwilling to accommodate to the demands of the new pattern of life tend to emphasise that they are somehow different because they are Muslims.

Consequently, a dissatisfied Malay either turns to a 'fundamentalist' Islamic party like PAS (Parti Islam se Malaysia) or seeks to direct the UMNO along more rigidly Islamic lines and only rarely turns to a non-communal party. Until the Malays turn in large numbers to non-communal politics, the present system of communal politics and accommodation will prevail.

As for the Indians, it is a case of once-bitten-twice-shy. The elite MIC tried non-communal politics before 1954 and paid dearly for it by being completely ignored. The 'politics of accommodation' has stood the test of time, especially after the advent of BN and the launching of the NEP. Though the Indians are acutely aware that they are only a temporary ally of the Malays *vis-a-vis* the Chinese, they dare not play the Chinese card. The Gerakan 'failed' them. The DAP may not, but it certainly involves hardship. During the 'emergency' of 1987, many Indian leaders of the DAP were incarcerated. The majority of the Indians are highly apolitical. They benefited marginally when the Malay gradually wrested economic power from the Chinese. They may benefit, again marginally, if the Chinese fight for and succeed in bringing about a more egalitarian society through non-communal politics. The big question, however, is whether that is the aim of non-communal politics advocated by Chinese-based parties like the DAP.

It is foolhardy to predict, especially when it concerns a large community like the Malaysian Indians. In an expanding economy, tensions tend to ease off. The pinch is felt only in times of depression. However, since the redressal of past imbalances in respect of education and employment may continue well into the next century, the ubiquitous, affluent urban middleclass Indians may not fare well and would not care much, as they may move out to Australia or the US. But, the majority of the working class may find it necessary to forge an alliance with their Malay counterparts. Notwithstanding religious differences, they have much in common.

Planning Process and Development Performance

V V Bhatt

Planning and Development in India by S P Gupta; Allied Publishers, New Delhi, 1989.

INDIA has been a pioneer among the less developed countries with mixed economies in thinking about as well as implementing a state-initiated process of planned development. Yet there has not been so far a systematic and comprehensive account of the evolving strategies, priorities and techniques of planning in the light of the shifting emphasis on development objectives. Gupta has provided such an account in this book and that is its distinguishing feature. Because of his participation in the planning process he is able to provide the nuances and details relating to this process which outsiders may not be in a position to know.

The book is divided into two parts. Part I presents plan strategies, techniques and performances and Part II covers the development of two major sectors: agriculture and industry. The main purpose of the book is to draw lessons from past experience as a guide for future action.

Gupta's major conclusion as a result of his critical study of the plan process over a period of thirty-five years is that "Indian plans seem to have failed to exploit the full potentialities of growth and development" as a result of "self-created constraints, arising from faulty planning" (p ix).

These self-created constraints, according to him, are largely the result of failure of the Planning Commission to institutionalise a process of learning by doing. The commission is so preoccupied with the formulation of the next plan that it has hardly time to study and analyse the reasons for differences between the anticipated and actual outcomes relating to development performance. As a result, the plan process has more or less remained the same and planning seems to have become a sort of ritual rather than an aid to formulating a rationally co-ordinated set of politics to facilitate and induce the required response from the diverse set of decision-making units.

The five-year plan is more concerned with setting production targets rather than with indicating such a set of policies; the plans, as D R Gadgil used to comment, lack a policy frame.[1] The process of policy formulation is *ad hoc* and fragmented and there is not adequate dialogue between the commission and the ministries in charge of policy formulation for evolving a set of policies consistent with the objectives and strategies of a plan. The result has been, according to Gupta, a set of mutually incompatible policies that have no direct relevance to action indicated in the plan.[2]

The process of rational policy-making becomes difficult partly because of the lack of appropriate machinery for the purpose and partly because of the manner in which plans are formulated. There is an obsession with the size of the plan right from early days and there is an attempt at fixing this size without an adequate study of the possibility of raising financial resources for the public sector plan.[3] The result inevitably has been increasing recourse to deficit financing, leading to inflationary pressures. Faced with the need for reducing government expenditures, the method followed has been a *pro rata* reduction of investment in all sectors. This mechanical approach to size reduction leads inevitably to creation of imbalances and distortion of plan priorities.

Further, the production and investment targets are fixed on the basis of inadequate and unreliable data with regard to input-output relationships and arbitrary assumptions relating to behaviour patterns. Since the actual behaviour patterns are not known and there is no systematic effort to study them, it is hardly possible to find out the direction in which they need to be modified and the policy instruments that need to be used.

The process of planning again casts doubt on the rationality of deriving financial and physical targets. To quote Gupta: "The bulk of the technical inputs for the five-year and perspective planning come from different working groups, set up, as a routine procedure, prior to plan formulation. Thus the working groups infuse technical expertise in the plan's allocative decisions... These working groups often prepare their reports on the basis of mutually inconsistent assumptions. Moreover, these working groups' reports usually come so late that many of their views cannot even get incorporated into the plan. To give an example, on the basis of more recent information on resource availability, the Planning Commission often independently reallocated the investment between sectors and regions, significantly different from those recommended by the working groups. But unfortunately in many instances, the physical targets accordingly were not reassessed, since there remained no sufficient time to refer them back to the working groups for necessary reassessments. This is one of the big 'gaps' in our planning process and it needs to be corrected" (pp 71-72).

Such arbitrary investment and output targets without reference to behaviour patterns lead to overemphasis on the volume of investment and administrative controls and regulations and utter disregard of efficiency or productivity of investment in the allocation of resources. This is also the reason why adequate attention is not given to the rational choice and selection of projects and both project and sectoral planning—in a sense the very essence of an action programme—is inadequate as well as inefficient. Since technology policy, essential for absorbing, adapting, diffusing and improving available technology, is much more relevant for sectoral and project planning, the neglect of such planning also leads to inadequate emphasis on an appropriate technology policy.[4]

In spite of the irrelevance and unrealistic nature of the planning models pointed out by him in Chapter 1, Gupta seems to believe that the planning process—both for five-year as well as perspective plans—would improve with the inclusion of "neglected variables" in the specification of the planning models (p 23). In fact in India and elsewhere these models have led, according to Little, to "excessive emphasis on central paper planning",[5] stultification of entrepreneurial and innovative impulses in the economy and neglect of the formulation of action programmes which represent the essence of any planning endeavour. To quote Little:

> A planning model is often confused with planning. Students who take planning courses are taught to construct planning models, not how to plan. Planners on the spot are also often mainly occupied with models, rather than with planning. However, their models sometimes have a lot of influence on the plan, even if little influence on what actually happens.
>
> Typical planning models assume fixed coefficients and linear relationships and aim at terminal-year consistency. Some arbitrary assumptions have to be made concerning levels of terminal capital stocks... Typically, many constraints have to be introduced to prevent the model producing extreme results. This applies particularly to exports, which are arbitrarily constrained. Many commentators, including the best model builders, have pointed out the rather obvious objections. The basic data are often very weak and out of date. Coefficients are not fixed, and substitution occurs in reality, though not in the model. The model often initially produces absurd results, and there has to be much juggling with the constraints to produce 'plausible' results. A reading of the experts suggests to me that none of them would claim that investments should be allocated on such a basis (though this would appear to have been done in India by the time of the Fifth Plan)... For instance, such planning would have effectively prevented the economic miracles of the Far East. Exports would undoubtedly have been constrained at levels far below those achieved; hence investment would have been prevented in export industries, and the achievements thus themselves prevented.[6]

The planning process has resulted in "a constraint upon thought and analysis"[7] as it has been overambitious in its coverage but much less ambitious with regard to growth possibilities. It has covered areas and laid down targets in sectors over which the state has no direct influence, and again these

targets have been fixed in the light of a growth model which is based on a modest increase of 5 to 6 per cent in the national income, thus smothering the full play of entrepreneurial and innovative impulses in the economy.

Further, such planning hardly represents the formulation of an action programme—which is the essence of planning—and of a set of well co-ordinated policies to influence the private sector activities. An action programme is essential and it relates largely to the sphere of detailed and well articulated plans of government action in the sphere of socio-economic infrastructure.

In these fields, a long-term view is essential and hence a sound perspective plan should in fact relate to detailed sectoral plans and sound formulation of projects. The other aspect of planning should relate to the adaptation and improvement of macro-economic policies in the light of the changing environment to induce and foster behaviour responses of the private sector that are consistent with the development objectives and to stimulate and suport entrepreneurial and innovative impulses in both the public and private sectors.[8]

From this point of view, India's perspective plans are hardly plans of action; there has been no sound perspective plan for the development of the strategic and critical elements relating to the task of development. There has been no plan of action in the fields of education and infrastructure to create facilities *ahead of demand* in an integrated manner so as to take into account interrelationships among them and within these sectors. It is this lack of a sound perspective plan in these fields that has created bottlenecks with regard to infrastructure facilities—in power, transport, communications, irrigation systems, etc—and prevented India from exploiting to the full even the growth potential built in the industrial and agricultural sectors.[9]

Gupta has neglected this dimension of planning; instead of emphasising technical improvements in planning models, he should have drawn attention to the urgency of planning effort in formulating action programmes and the resultant need of changing the structure and functions of the Planning Commission.

Because of the comprehensive analysis of the planning process made possible because of the author's close association with it, and the plan- and period-wise analytic presentation of data, not easily available elsewhere, policy-makers in India as well as students of the Indian planning experiment will greatly benefit from this book.

Notes

2 See V V Bhatt, *Two Decades of Development: The Indian Experiment* (Bombay: Vora and Co, 1973). To quote: "A Plan ceases to be a plan of action unless it indicates precisely the nature and content of a feasible and co-ordinated set of policies; it becomes merely a set of projections based on certain *unspecified* assumptions with regard to the behaviour of the public sector and the private sector groups... This weakness of the plan process, coupled with the fact that there is no machinery for discussing and evolving a co-ordinated set of policies, leads to the adoption of un-coordinated and mutually conflicting policies, which in turn affect adversely plan performances" (pp 28-29).

3 On the basis of the flow-of-funds technique developed by the Reserve Bank economists in 1968-69, Gupta formulates a sound methodology for financial planning in Part I Section 3 of his book. See also V V Bhatt, ibid, pp 26-38.

Futile Findings

Atul Sood

Punjab Crisis: The Political Perceptions of Rural Votes by Jitinder Kaur; Ajanta Publications, Delhi 1989; pp 1984, Rs 125.

A NUMBER of studies are coming forth attempting to explain the crisis in Punjab. However, barring a few serious efforts, most of the writings have analysed and commented on one or the other aspect of the phenomenon with little effort to explain the 'whole'. Economists have dug out 'the economic roots of Punjab crisis', political scientists have commented on 'Sikh politics', 'role of political parties', 'elections', while journalists have tried to see the crisis through the operation of 'forces' like Bhindranwale, Barnala and events like Operation Blue Star, Black Thunder and Wood Rose.

The book under review is also a 'micro level study of Punjab elections of September 1985' (page 126). It is the study of 'political outlook of the people of Punjab (in fact 350 respondents) one week before the 1985 elections' (page 3) in Ghanour assembly constituency of district Patiala. Elaborating the characteristic features of the area under study the author notes that the younger people are more literate, level of literacy is higher among high caste respondents, high caste people do not do menial jobs and that those having good education and economic status are 'politically' more informed. The main findings of the study are that demands raised by Akalis are perceived as demands of Sikhs and not of Punjabis, Sikhs are hostile to the government and are feeling hurt due to Operation Blue Star and 1984 riots, few support the demand for Khalistan, people have lost faith in the efficacy of political parties and that the voting in 1985 elections was along communal lines.

What conclusions are we supposed to draw from such findings? What does it contribute to our understanding of the immense human tragedy which the people of Punjab are suffering. No doubt, it is important to know 'people's perception' about terrorism, fundamentalism, political parties, etc, but is it *per se* sufficient? The important question to answer is what determines the perception of the people. How does people's perception contribute to the dynamics of the situation? In fact, study of people's consciousness *per se* cannot be used to understand the concrete processes of history. Consciousness has to be seen as embedded in the dynamics of the concrete reality, historically. This is not to suggest that the relation between objective situation and people's perception be looked at in a deterministic manner. Rather it must be understood in all its complexities and all its mediations.

That there was polarisation of voters along communal lines in 1985 elections and that there is communal divide in Punjab, logically follow from the kind of approach of the study. The study discusses the communal divide with hardly any reference to the process and forces which create such a situation. It is far too obvious that religion, caste and other such parochial identities are used by different political parties of Indian ruling classes to consolidate their power and keep the people away from forging unity. Not much doubt remains on this score now. Studies have shown it substantively and built it logically. One hardly stands to gain anything from the present work.

On the other hand, on observing the data which has been made available by various micro level studies on voting behaviour in Punjab, an interesting observation can be made. The data shows that Akalis have polled higher percentage votes in Malwa region as compared to previous elections. It is also a fact that Hindus form a substantial portion of the population in this region and in Patiala district (the area of study of the work under discussion) the demographic divide in terms of religious group affiliations is nearly equal. The finding of the study that 'Hindus' hold Akalis responsible for the crisis and that there was complete communal polarisation among voters cannot then be accepted. Probably a contrary conclusion can be drawn. This is in fact the silver lining in the otherwise bleak scenario of Punjab which needs to be highlighted.

Oraon Labour Agitation

Duars in Jalpaiguri District, 1915-16

Ranajit Das Gupta

The agitation of the tea plantation workers in Jalpaiguri district having strong messianic overtones and an anti-colonial content had its origins in the Tana Bhagat movement in Chhotanagpur which reflected the aspirations of the Oraon peasants for deliverance from the exploitation of zamindars and mahajans. This paper studies the short-lived agitation in Jalpaiguri.

THIS paper deals with a widespread agitation that took place among the tea plantation labour of Duars in Jalpaiguri district in north Bengal. Starting in several gardens in November 1915, it spread rapidly to a large number of gardens stretching over the extensive Duars plantation tract and continued till mid-1916. Although the agitation was a short-lived one, it had several distinctive and significant features. But till now it has not received any attention from scholars. It is hoped that a discussion of various aspects of the agitation will be of help in enriching our understanding of tribal as well as of plantation labour protest movements in our country.

I

The agitation was, in fact, an extension of the Tana Bhagat movement that had originated among the tribal peasants—specifically speaking, the Oraon peasants—engaged in settled agriculture in the Ranchi district of Chhotanagpur in April 1914.[1] Initially, the Ranchi movement had the character of a religious and social reform movement, but eventually came to have important economic and political dimensions. The movement was basically based on the aspirations of Oraon peasants for deliverance from the exploitation and oppression of the *zamindars, mahajans* and *sarkar*.[2]

In its origin the Tana Bhagat movement had features which have come to be known as messianic.[3] In early 1914 the movement was launched by one Jatra Oraon who had mysterious dreams. The Oraons were called upon to 'pull out' (tana) ghosts and evil spirits which they had till then tried to appease but which were now held responsible for their misery. They were asked to abstain from meat and liquor and thus to purify and reform their lives. Participation in certain community dances and festivals too were forbidden.[4] They were also told to give up ploughing their fields, which entailed cruelty to cows and oxen but failed to protect them from poverty and famine. In this, in the form of a yearning to go back to pre-settled forms of agriculture, a protest against exploitation by the landlords and the government was discernible. Some of the *tana bhagats* even stopped payment of rent to their landlords and ploughing. They were, moreover, called upon to do no work as coolies and labourers under men of other castes and tribes. The latter aspect referred to labour in the tea gardens as well as in the fields of large landholders in many districts of Bengal and Bihar.[5]

As stated already, it was a messianic movement and it was believed that god (whom they called *dharmes*, the 'just', the supreme being or Bhagwan, the bountiful) would send a messiah down to earth to redeem the Oraons from their miserable plight. Sometimes, the messiah was identified with Birsa, the Munda rebel of late 1890s, and sometimes with German *baba* or benign god (Kaiser Wilhelm II?) who was at war with the British.[6] The movement also looked forward to a millennium or a 'golden age'. It, however, soon assumed forms that were considered dangerous by the colonial government. It threatened to break out into open revolt against the *dikus* (outsiders) and all exploiters and oppressors. Along with this, various symbols of 'modern civilisation', such as railways, steamboat and bicycle had to be 'pulled out' or expelled, as the suffering of the Oraons came in the wake of their introduction.[7] Thus, these reactions signified a rejection of colonial capitalist penetration and associate instruments.

II

The reverberations of the movement in Chhotanagpur soon came to be felt in the distant Duars.[8] In the wake of the launching of the tea plantations in the Duars in the mid-1870s, with the active assistance of the colonial state, large-scale migration of tribal, particularly Oraon peasants had been organised by the planters—overwhelmingly Europeans—to the Duars tea gardens.[9] The Oraon migrants in the Duars numbered about double the number of the Munda and Santal migrants taken together.[10] But the migrant tribal peasants-turned-into-wage-labourers on the tea gardens had a deep attachment for their homes and lands in Chhottanagpur and Santal Parganas. In his report on 'survey and settlement' work in the Ranchi district during 1902-1910 Reid, the settlement officer, observed:

> Large numbers of those who emigrate to Assam and the Duars return, if they are able to save a little money, and buy back the farms they had lost, or some land in the vicinity.[11]

Continuing he reported:

> A considerable percentage of the emigration is periodic and non-permanent. The Uraons especially emigrate in large number... during the cold weather, when there is little or no work to do in their fields and return home before the monsoon breaks to begin the cultivation of their fields.[12]

In view of this persistence of connections with Ranchi, it was quite natural that the Tana Bhagat movement had its echoes among the Oraons in Duars. But this movement was not just a replication of the movement in Ranchi. The *specificity* of its locale, particularly the British-dominated plantation economy and the horrible exploitation and oppression of plantation labour in the Duars, had its *distinctive imprints* on the movement.

The year 1916 was a war year and the stir came to be viewed by the planters and the colonial government as well with considerable alarm. In his address to the annual general meeting of the Duars Planters Association (DPA) held in January 1917, W L Travers, DPA chairman, spoke of the 'great anxiety' caused to the European planters by the outbreak of what was considered by them as 'a new and dangerous movement amongst the Oraons' in the early months of 1916.[13] In the Bengal government's *Report on the Administration of Bengal* for 1916-17 it was stated that the labourers of several gardens were 'said to be eschewing meat and strong drink and singing songs containing references to a German Victory'.[14]

From available evidence it is found that the agitation consisted of two phases, though, as we shall see, these were never clearly demarcated. In the first phase, it was primarily a socio-religious reform movement. There was an initiation ceremony, and those who passed through this ceremony called themselves *bhagats* or devouts. Their utensils were destroyed, and drinking of *hari* (rice beer the drinking of which was an important part of the tribal social life) and *daru* (the country liquor) were prohibited. All meat except white goats and white fowls

became a taboo. Those Oraons who did not go through the ceremony were excommunicated and the fear of excommunication perhaps persuaded many Oraons to join the movement.[15]

At the initial stage, the stir was viewed by the planters as an expression of aspiration for social and spiritual improvement and, hence, the planters and the district administration were not much perturbed. In the address referred to above Travers observed:

> Many of the ideas connected with the first stage were excellent, and had the movement stopped there, it would have been encouraged by planters.[16]

But there was a swift transition to the second phase characterised by an anti-British and anti-planter content and direction, and these were infused with Oraon religiosity. It was this latter aspect which was one of the factors that gave the agitation a wide appeal.[17] According to the official version, the movement in the Duars had a political orientation from the very beginning and with the unfolding of the movement this became increasingly pronounced. In the trial of Bania Oraon, Laudha Oraon and Mangra Oraon, all tea garden workers, for their allegedly leading role in the movement, the prosecution case was that since November 1915 Oraon tea garden workers had been

> holding meetings at nights and singing hymns to the 'German Father', whom they invoke[d] as if he was a god, calling on him to come and drive out the English, whom they compare[d] to devils, and give an independent raj to the Oraons.[18]

It is possible that the prosecution exaggerated the political tone of the movement. But undoubtedly one major distinguishing feature of the Duars movement was its much stronger political orientation than the one in Ranchi. In connection with the second phase, another important feature deserves to be mentioned. Though throughout its course the movement by and large remained peaceful, it was in this phase that it came to exhibit a relatively militant tone. In their exchanges with the garden authority or in their defiance of the latter which are mentioned below this tone is discernible. Inter-tribal solidarity was another distinctive feature that came to be manifested. Though the movement was predominantly a movement of the Oraon workers, it did not remain confined among them alone. It came to involve, as shown later, several non-Oraon tribal and semi-tribal groups too.

The incident that first brought the movement to the notice of the district administration indicated the political dimension unmistakably. The official account of the incident is given below:

> A man named Charua Oraon cut his wife's throat and then tried to cut his own. He told the police that the villagers had asked him to 'sing the name of the Germans' and had threatened that, if he did not, a devil named Logo would kill him. He and his wife resolved to kill themselves rather than be killed by a devil... He said that an unknown man was always telling him to recite something, and that as he refused, everyone abused him and his wife, so they resolved to commit suicide...[19]

Charua was too badly wounded to explain what he refused to recite and died in the jail hospital.

The event was reported to the police on January 25, 1916. Subsequently the superintendent of police made enquiries to find out what the 'mysterious recitations' were. On February 25 he received a letter from the manager of the Tasati tea estate, containing

> a list of eight Oraon men and six Oraon women who were holding seditious meetings and calling to the 'German Father' to come and save them. The manager said that they were upsetting the coolies in his garden and that it was rumoured that there would be a row at the Fagua Puja (March 18 to 21).[20]

On March 1 the DPA chairman informed the police that a meeting of garden managers was held to discuss the Oraon unrest, but they could only discover that 'mysterious meetings' were being held at night and that trouble at the *Fagua Puja* was apprehended. On March 2 the manager of Sarugaon Tea Estate intimated the police that Hasru, a *sardar* in that garden, was involved in the movement and 'was adopting a threatening attitude towards the garden staff...'.[21] P T Monckton, the superintendent of police (SP), went to the Tasati tea estate on March 1 and interrogated some Oraon labourers. Dublai and Letho, two Oraon sardars, repeated to him the words of two of the songs sung at the meetings. The next day Monckton arrested ten Oraons in that garden, including Letho, who allegedly had helped the holding of the meetings.[22]

On March 4 an informal meeting of the DPA Committee was held and this was attended by the deputy commissioner of Jalpaiguri and also the SP. From the proceedings of the meeting the following is learnt:

> On one garden he [the SP] considered that the movement had gone very far, and there was a distinct *seditious* element in connection with the German Raj. Again on another garden he had been called in for, the coolies had *refused* to work, saying that they had no allegiance to the British Raj. The coolies were almost in mutiny saying that the German Raj was coming in to govern the country[23] (emphasis added).

The meeting was told by one member of the committee:

> ...the idea was held that the Germans would take possession of the Raj, and that those who helped the Germans would be rewarded by gifts of land in [Chhota] Nagpur, their ancient country.[24]

Another member told the meeting:

> ...there was a secret movement with a vow to exterminate the Sahibs. The vow was sworn by god, Germany and blood.[25]

The managers reported acts of open defiance of authority. In Sarugaon tea estate Hasru and Kandru refused to work. When asked by the manager if they were taking part in the movement, "Hasru shouted in a loud voice 'who said so?', and when the manager ordered him to put down his hoe and report himself at the office, he and Kandru and another man threw down their hoes and ran away...".[26] In the trial of three Oraon workers of the Gurjangjhora tea estate (western Duars) the prosecution referred to another instance of collective defiance. The estate manager was informed by the *chowkidar* that the Oraon workers of the garden were having meetings and songs in lonely places and intended to abstain from flesh food and liquor and to lead a religious life. But this information alarmed the manager and he sent for two Oraon leaders. They came accompanied by forty Oraon workers. The leaders were asked to leave the garden and go elsewhere. But they refused to be separated from others on the ground that it would interfere with their prayers. They then left the manager and while they were leaving they were "heard to mutter something in the Oraon language which the garden officers did not understand". But the manager's servant interpreted it to mean, "if we beat him, what will happen?"[27]

These instances of course need to be considered with caution. With reference to the Gurjangjhora incident *Amrita Bazar Patrika* (a nationalist English daily published from Calcutta) of May 10, 1916 editorially observed, "there is no evidence to show if the servant interpreted the coolies correctly or not". As pointed out in the same editorial, "...among so large a population not a single act of violence or rowdyism... was reported."[28] Yet it is evident that the movement had a distinct anti-British political overtone. The political responses of the Oraon labour to both British rule and planters' domination and the Oraon political aspirations found expression in the Oraon labour agitation which, it may be reiterated, had a tribal religious dimension too. All this came to be articulated *inter alia* in the collective singing, often continuing till midnight. Despite its ambiguity, the following song composed by Letho, a *sardar* in the Tasati T E, and cited during the trial of Oraon workers as evidence of sedition, shows the Oraon political attitude:

> German Baba is coming,
> Is slowly slowly coming;
> Drive away the devils Manaldanal:
> Cast them adrift in the sea.
> Suruj Baba (the sun) is coming;
> The Devils of the Oven will be driven away
> And cast adrift in the sea.
> Tarijan (the stars) is coming,
> Is slowly slowly coming,
> Is coming to our very courtyard
> The chigri devils will be driven away
> And cast adrift in the sea.[29]

One prosecution witness told the special tribunal appointed to try the tribal workers, mainly Oraons and a few non- Oraons, who

were alleged to have had taken leading role in the movement:

> ...there is a hidden meaning in this song... the new school of Oraons call the English devils (deos) and... the devils of the Oraons referred to in the song are the English.[30]

Asked by one of the commissioners if he had ever heard the song and knew its meaning, Birsai, another witness, said:

> ...Yes, he had heard it, and it meant that the Germans were coming to make war, and the government people would be thrown into the sea. He said that new school always speak of the Germans as Suruj Baba (the sun)...and that Tarijan Baba also meant the Germans, while of the devils Manaldanal meant the English, and the devils of the Oraons (*sic*) [oven] or hearth meant those Oraons who did not join the new movement.[31]

The special tribunal in its 'Judgment in the Oraon Case' accepted this interpretation:

> Now it is certain that the Oraons are not under any mistaken notion as to who and what the Germans are. Two or three witnesses have told us that the export of tea from the garden was stopped for a time in December [1915], and they heard from the manager that it was because there was war between the English and the Germans. And when the price of salt and foodgrains rose in the markets the *modis* [grocers[and *mahajans* also told them that it was due to the war with the Germans. So it appears that the new Oraons are deliberately invoking the head of the King's enemies as if he were a god and calling on him to come and cast certain devils into the sea.[32]

The special tribunal further stated:

> The devils cannot be spiritual devils, and it is highly probable that they represent the English. Manaldanal is a particularly exacting devil to whom, if an ancestor once sacrificed a bullock, all his descendants must for ever after sacrifice a bullock. Such a devil might well be chosen to represent the government. And unless it was chosen for this purpose Manaldanal would not be likely to be mentioned at all.

While the details of this interpretation may not be correct, that the song had an anti-imperialist content is unmistakable. And further, this was informed with tribal religious consciousness.

At this stage it is appropriate to raise several questions: How did the movement start in the Duars? How was it organised? How did its message spread? That the Chhotanagpur connections of the Oraons who had migrated to the Duars were never totally snapped but were, in fact, retained and quite intimate has been noted earlier. Available evidence suggests that some Oraons coming from Chhotanagpur first brought the message of the movement to the Duars. Travers reported:

> Now this belief came to the Dooars from Chhotanagpur. The disseminators were often young intelligent boys who appear to have learnt the part of a preacher of the new faith...[33]

In early 1916 the manager of the Sarugaon tea estate reported to the police that an Oraon named "Landroo had come from Chhotanagpur and was preaching the new movement".[34] From the special tribunals judgment it is learnt that Landroo's brother Hasru was a *sardar* in Tasati garden and several meetings were held in his courtyard as far back as November 1915. Dublai and Letho, two other *sardars* in Tasati, too were prominently involved in the movement.[35] All this suggests that while the movement came from Chhotanagpur through young Oraons moving to the Duars, some of the *sardars*, though certainly not all, played a crucial role in organising the network.

What were the mechanisms of transmission of the message of the movement? There must have been, to borrow the language from a major work on peasant insurgency, "a variety of means which were all specific to a pre-literate culture...".[36] As Child, one DPA committee member, reported:

> ...six weeks ago a message—a letter with a few rupees and some rice—had come from Manabari (T E) and had been passed from hand to hand among his sirdar and then sent on to Hope (T E) and other gardens.[37]

It is not surprising that the British planter found all this incomprehensible: The meaning of the message was unknown to him.[38] The managers and the British administrators repeatedly referred to 'mysterious meetings', 'mysterious recitations', 'unknown message', and so on. In fact, such meetings and songs were among the important 'instruments of transmission' and mobilisation of the Oraon workers. Travers in his address referred to above stated:

> ...mysterious meetings were held at night, in lonely places where interference by others was improbable. The Oraons attended, armed with bows and arrows, axes and spears, and sentries were posted who threatened to kill any stranger who approached. He know that at these meetings songs were sung in which the aid of the German baba was invoked. They were taught and believed that the British raj was coming to an end, and that if they aided the Germans the latter would give them land in their ancient country where a subsidiary Oraon raj would be established. Not only were the British sahibs to be driven out, but also the Mundas and Mohammedans.[39]

Continuing he said:

> All this was mixed and confounded with superstitions in the most extraordinary way—in fact, many of the Oraons regarded the German baba as a god...not as the Kaiser...one sirdar afterwards confessed that a picture of the German maharajah, seated between two gods, had been passed from hand to hand amongst those in the movement in his garden. Many other facts came to light, but undoubtedly the idea underlay them all, that the British raj was coming to an end, and at a given signal the Oraons were to help exterminate the British sahibs.[40]

The spread of the movement with its pronounced anti-British and pro-German tone and aspiration for a Oraon raj caused great alarm in the minds of the planters as we[ll] as the government officials. Though ther[e] was no report of any overt acts of violenc[e] such as assaults, riot or murder, the collec[-]tive mobilisation of discontented an[d] agitated tribal workers and several incident[s] of open defiance of the garden managemen[t] amounted to a frontal confrontation wit[h] the authority. In the prevailing atmospher[e] these came to be regarded as a threat to th[e] existing order. The March meeting of th[e] DPA committee attended, among others, b[y] the deputy commissioner and the SP dis[-]cussed in details measures for suppressin[g] the agitation and also for mobilising loya[l] *sardars* from among the Oraons.[41] Following the meeting garden *sardars* were made special constables and held responsible for maintenance of peace in the gardens, and armed police pickets and police camps were set up in different parts of the Duars to keep watch on the restive Oraons.[42] Many arrests were made and a special tribunal was appointed under the Defence of India Act to try the 'ringleaders'. Some of the arrested Oraons were sentenced to rigorous imprisonment for varying periods.[43] The Fagua Puja passed off without any disturbance and by late 1916 the agitation subsided.

But the planters remained in a state of apprehension about the recrudescence of the movement. Thus, when Ghura alias Somra, who was considered as 'one of the instigators in the Oraon unrest' and was sentenced to six months' imprisonment, returned to the Duars in March 1917 after his release from jail there was a consternation among the planters, and they pressed the district police authority for taking action against him.[44] In response to this the superintendent of police wrote to the DPA chairman:

> In forwarding a list of the [29] Oraons [sic] convicted in this district, I write to request you to arrange with the managers of tea gardens concerned that they may not be re-employed in gardens if they come back again from their native homes after their release from jail.[45]

He further wrote:

> ...such Oraons [sic] who have been given lands or *jotes* or who have relations settled in Jalpaiguri district should not be allowed to call themselves permanent settlers of this district and to this end it is most desirable that grants of land to them or to their near relations should be withdrawn.

In May 1917 in the neighbouring Terai plantation area in the Darjeeling district there was a limited outbreak of a similar agitation.[46] In Jalpaiguri district, however, there was no fresh outbreak of the movement.

III

Any analysis of the nature of this short-lived ferment is full of complexities. The movement had three distinct strands: religious, social and political. However, the three strands which were present through its course interacted and interpenetrated with each other giving a considerably complex

character to the movement. It is this aspect which led R H Craddock, a government of India official, to speak of the movement in the following language:

> It is a curious and interesting case how modern events become garbled up with superstition and demonology among unsophisticated folk of this kind.[47]

But to Craddock the movement represented largely 'superstition and demonology'. He and many of the colonial officials were not in a position to understand the language, idiom and 'code' of the struggle of the tribal workers. J W Nelson of the criminal intelligence office, however, showed somewhat greater perception. He mentioned three aspects of the movement:

(1) Economic unrest due to the rise in prices, which was attributed to evil spirits and witches—hence attempts to drive evil spirits out of the villages and the murder of supposed witches.
(2) A religious revival of a highly emotional type with secret all-night meetings and the singing of *mantras*.
(3) A social movement, closely connected with the religious movement, directed towards elevation of the caste. Hence the prohibition of animal food and intoxicating drink, resolution not to work as palki-bearers, etc. As in all such movements the influence of Hindu ideas is obvious.[48]

In this observation one finds indication of an awareness of a complex inter-relationship between religious fervour, social reform efforts and concern about economic issues. Nelson, however, did not mention the issue of political power underlying the agitation among the tribal workers.

But on the basis of an analysis of an Oraon song sung in the Duars another official hinted at the political dimension:

> Some portions of the song suggest that the movement is an attempt to purify the tribal religion and to cast off superstitions and to get rid of corruption of ancient faith...It appears probable that the restriction of flesh food to white goats and white fowls is based on their being the proper offerings to Dharmesh and is connected with a scheme for driving out foreign devils.[49]

The socio-religious aspect mentioned above was a common feature of many of the tribal protest movements in India under British rule. But, in addition to that, the Duars movement had a distinct political orientation. The Oraon songs sung in Duars repeatedly and emphatically spoke of driving out the British and the establishment of an independent Oraon raj.

In their vision of an independent Oraon raj the Oraon workers came to look upon the Germans as their 'liberators'. This led the British planters and some colonial officials to suspect German hands behind the Oraon agitation.[50] The Oraon workers described by Craddock as the 'unsophisticated folk' were thought to be incapable of acting on their own. Hence, they must have been 'manipulated'. It should be added that the British rulers and their associates had always tried to explain anti-imperialism and any popular mobilisation in terms of manipulation by an external agency such as German or Russian power, disgruntled Indians, etc. But, despite efforts made by the prosecution, no foreign, that is, German manipulation could be established. As a matter of fact, available accounts show that the German missionaries kept away from the movement. The participation of christian Oraons too was negligible.[51]

But how one is to explain the Oraon view of the Germans and even of the Kaiser? The explanation lies basically in the specific historical context. The immediate international background was one of victories won by the Germans in the early years of the war. The dislocating impact of the war on the tea export, tea industry and employment in the industry was experienced by the Oraon workers. They were told by the *madis* (grocers), *kayas* (marwari traders in the Duars) and moneylenders that the sharp rise in the prices of salt and foodgrains were due to the war. The reverses suffered by the British gave rise to the rumour that the British raj was not only in crisis but also coming to an end. Here was a rumour about weakening of the authority structure eventually leading to the breakdown of authority. All this came to be associated with the might of Germany. It was against such a background that the enemy's enemy came to be viewed by the Oraons as a friend and, indeed, even as their emancipator. It will not be inappropriate to mention here that during the war years large sections of revolutionary nationalists too were looking upon Germany as an ally to the nationalist cause.

Taking all relevant aspects into consideration it can be stated that in its origin, direction and content the ferment was basically indigenous and autonomous—autonomous in relation to non-tribal or any outsider leadership and organisation. It was an instance of self-mobilisation based on tribal solidarities and its roots lay in the miserable social existence condition of the tribal workers in the Duars plantation are and also the tribals in general in Chhotanagpur. The call in the songs to drive away the devil Manaldanal, a particularly exacting devil, perhaps representing the British government indicated an urge to abolish the British rule. Moreover, the worship of the German emperor reflected a deification of the British king's enemies, and the English were relegated to the position of one among a host of tribal devils.

In all this the anti-imperialist dimension of the movement is manifest. One additional dimension was the anti-planter or anti-capitalist one. Though in the available records there is no explicit reference to any specific grievances and aspirations of the tea garden workers, there is no doubt that the Oraons and other tribals involved in the Duars agitation also *acted as workers*. In their 'defiance of garden management' and 'refusal to work', about which the planters and DPA showed great concern, there was evidence of class conflict of an incipient nature. In the particular movement under examination the latter dimension came to be *subsumed* under autonomous manifestations of anti-colonialism.

The anti-imperialist and anti-capitalist affinities in the Duars, however, did not exclude community and, in this case, tribal affinity. In fact, the responses to foreign rule and planter domination came to be encapsulated in tribal religious consciousness, a dimension which made many aspects and expressions of the Duars agitation largely incomprehensible to the planters and colonial officialism. It was also this tribal-cultural identity which inevitably gave rise to some ambiguities. But while one can hardly ignore the importance of this identity, it needs to be stressed that it did not lead to displacement of anti-imperialist and anti-planter consciousness.[52] Rather, the Oraon religious beliefs and practices contributed towards the strengthening of this consciousness.

The Duars agitation, as noted above, began as a continuation of the Chhotanagpur Tana Bhagat movement among the Oraons of Duars and was initially an example of *vertical* mobilisation embracing Oraon plantation workers. But it represented much more than that. As mentioned earlier, the Duars agitation soon came to involve non-Oraon tribal, semi-tribal and even a few non-tribal workers, although the Oraons constituted the predominant element. The most clear evidence of participation of the non-Oraons is an incomplete list of convicted workers.[53] Besides the names of twenty-three Oraons, it contained names of two Mundas, two Mahalis, one Goala (milkman, cowherd) and one Teli (oilman) all of whom had been sentenced to rigorous imprisonment for taking part in the movement. This testifies also to the feature of *horizontal* mobilisation. In fact, here is evidence of a convergence of both vertical and horizontal solidarities. And solidarity at the level of Oraon workers and also the solidarity between Oraon and non-Oraon workers was more than just tribal or ethnic solidarity. These also signified self-consciousness of the workers about the

exploitation and oppression experienced by them and entailed anti-imperialist as well as class solidarities. To restate, there was an *overlapping* of anti-British content of the movement, class solidarity and tribal or ethnic loyalty.

What were the actual mechanics of achieving, maintaining and consolidating these solidarities? The account of the genesis and unfolding of the tribal worker movement presented earlier shows that various mechanisms were combined in varying degrees. These were, among others, the pull of tribal ties and tradition, the parleys and assemblies such as meetings held in the 'coolie' lines and also lonely places, the collective chanting of *mantras* or incantations, the use of community or tribal idioms and 'codes', the reforms in social and religious practices (e g, eschewing of meat and strong drinks and prohibition of community dances and songs), the rumour about imminent British defeat and German victory, the vision of an independent Oraon raj, the promise of land, and the power of religious, political and community commitment to 'exterminate the sahibs' sanctified through 'the vow sworn by God, Germany and blood'. The experience of rise in prices of salt and foodgrains and the information about fall in tea exports were put to intelligent use to spread the rumour of British *raj* in crisis. It appears that a roving band of young 'volunteers' or 'cadres' carried the message of the movement initially from Chhotanagpur to the Duars and later on from garden to garden and helped to forge and strengthen the solidarities mentioned above.

The Duars tribal labour agitation, as in the case of any popular movement, had its share of fence-sitters, vacillators and collaborators. The flow of information to the managers illustrates the extent of collaboration. The authorities too encouraged dissidence and betrayal. In Gurjangjhora tea garden the manager tried to isolate two leaders from the rest of workers. In Duars as a whole the police authority rewarded the loyal workers with the position of special constables.

Under the circumstances, the solidarity of the workers involved in the movement found expression in the exercise of collective authority against the non-committed, vacillators and workers loyal to the authorities. The major instrument to get support from those who were undecided and also to deal with dissidence from the movement was social boycott or ex-communication which was often accompanied by abuse and threat. This is what appears to have happened in the case of Charua and his wife.

There were several cases in which the workers saw through the management's game and foiled it. Faced with the danger of dissidence and treachery, measures were taken to defend the movement and protect its leaders and 'cadres'. The practice of holding meetings and recitations in lonely places and under the cover of darkness was one such measure. The Gurjangjhora garden incident also provides an illustration of protection given to leaders. Thus, when two leaders were summoned by the manager, a large body of workers went with them, and when the two were given an order to leave the garden, the workers accompanying them refused to part with them.

A distinctive feature of the movement that deserves to be mentioned was its democratic character. Most of the tribal movements in colonial India including the Tana Bhagat movement were centred around a supreme leader having prophetic power.[54] But the Duars movement, though an extension of the well known Oraon movement, did not have any such leader. Available records highlight the role of garden *sardars* and also that of collective consultations through assemblies and gatherings.

Despite the presence of many significant dimensions, this particular variant of protest and struggle of tribal peasants turned into plantations workers soon run its course. The impact of the movement on the subsequent socio-political life of the tribal and particularly Oraon workers remained ambivalent.

Before concluding this paper, one more observation needs to be made. That one is in relation to the nationalist attitude towards the Duars tribal labour agitation which had a distinct anti-British thrust—in fact, the earliest instance of popular anti-imperialist struggles not only in the Duars but in the district of Jalpaiguri as a whole. It is found that, may be because of patriotic consideration and/or some other reasons, the *Amrita Bazar Patrika*, a Calcutta-based nationalist daily, took a sympathetic view of this protest and struggle. But the nationalists of Jalpaiguri district itself, however, appears to have remained totally indifferent to it. That the Oraon agitation came to the notice of some of the nationalists of the district has been put on record.[55] But there was no awareness of its significance and the need for having any links with it. A major part of the explanation lies in wide socio-cultural gap that the *bhadralok* (upper-caste educated Bengali middle class) nationalists of Jalpaiguri had with the 'coolies'. Thus, tribal anti-imperialism and bhadralok nationalism remained distanced from each other.

Notes

[This is the revised version of part of a longer paper entitled 'Ambiguities of Class Formation: Plantation Capitalism, Workers and Collective Action in the Duars, 1890s- 1947' brought out in January 1987 in the *Working Paper Series* of the Indian Institute of Management Calcutta. In writing this paper I have benefited much from discussions with Asok Sen, Barun De and Surendra Munshi. I alone am responsible for all the shortcomings. Failure of Livestock Investments under IRDP

Evidence from Two Villages in Tamil Nadu

Paul Seabright

The evidence of this study suggests that even when subsidies are included, the benefits to households of investing in livestock through the IRDP have been significantly below those to livestock purchased outside the scheme. Depending on the measure used, somewhere between a third and more than a half of IRDP participants in the study villages were actually worse off as a result of their loans (or would have been in the absence of partial write-offs of their dues). This was principally due to higher prices paid by IRDP participants in the livestock markets, prices which were not compensated by higher quality of the animals purchased—in other words, to price discrimination. Undoubtedly this price discrimination was facilitated by the presence of large subsidies. There is also evidence that households lacking land and underemployed household labour were not able to manage livestock investments economically at this small scale of production.

I

DISCUSSIONS of the effectiveness of the Integrated Rural Development Programme need to separate two questions. First there is the measurement question: how to determine whether and to what degree the IRDP has been successful in a particular context. In particular, since the IRDP is intended to encourage investment in productive assets by the rural poor, the question arises to what extent the investments identified under the programme have been either privately or socially productive. Second, there is the question of causality: what are the reasons for the performance of the programme, and (in particular) to what extent are its shortcomings intrinsic to the conception of the IRDP as opposed to being accidental and remediable features of its design?

The evidence of this paper, collected from one dryland and one wetland village in Tamil Nadu during 1985, suggests a bleak answer to the first question and at least a sobering answer to the second. In particular, investments in livestock, in the management of which the poor are often thought to possess a comparative advantage, and which form the backbone of the IRDP, have low profitability for many categories of poor household. Most importantly, the presence of substantial subsidy has not helped: livestock investments by IRDP beneficiaries in the study performed worse than livestock investments by a control group of non-beneficiaries, *even after all subsidies had been taken into account*. The reasons for this are partly but not only flaws in the programme's implementation. Though there are undoubtedly leakages in the form of bribes and other side-payments, for example, these are not large in comparison with the main element in the poor performance of IRDP investments: namely, substantial price discrimination between beneficiaries and non-beneficiaries in livestock markets, which are very far from being the anonymous competitive markets they are often assumed to be. It is not just that the IRDP has raised livestock prices generally, though this may also be true. IRDP beneficiaries typically pay inflated prices that are not compensated by higher livestock quality, and that they cannot recoup on resale.

It is integral to the philosophy of the IRDP that it seeks to promote productive investment by means of an intervention in the credit market. It is often thought that the poor, with their substantial endowment of (frequently underemployed) labour, must be potentially well placed to achieve a comparatively high rate of return on capital. The reason for the persistence of assetless poverty then appears to be a malfunctioning market for capital, which for a variety of reasons including uncertainty, discrimination and conservative collateral requirements, denies to those who do not already possess assets the means to acquire them. It is to correcting the imperfection of this capital market that the IRDP programme is principally directed. But the data examined here suggest that, even in the presence of abundant credit, it may be very difficult to identify productive investment opportunities for the rural poor. The reasons consist partly in the presence of increasing returns to capital at low levels of investment (including the effects of risk management and the complementarities between different kinds of capital), but mainly in the secondary distortive effects that generalised schemes of subsidised credit such as the IRDP have on asset and other factor markets. This suggests that it is not enough for anti-poverty programmes to overcome the barriers to the *availability* of credit to the poor. They must also assist the poor in identifying productive investments, the difficulties in doing which have been significantly underestimated. Investments in livestock, funded by subsidised credit, may be a valuable component of anti-poverty programmes for certain kinds of household. If the results reported here are of more general validity, however, they suggest that livestock investments may be quite unsuitable as an across-the-board approach to rural poverty.

II

The Study[1]

Two villages were studied in dry and wetland areas of Tamil Nadu during 1985. Each had established a milk producers' co-operative society whose members had taken out IRDP loans during the previous two years. There were 46 beneficiary households in the wetland village (out of a total of 307 households), and 36 in the dry (out of a total total of 259). These households, plus a control group of 40 households in the wetland village and 37 in the dry, were asked for details of all livestock owned at any time during the previous three years. The resulting sample of milch cattle consists of 379 adult females, divided (as it happened) almost exactly between the two survey villages. For each animal the following data were collected (where appropriate):

—purchase price.
—sale price.
—daily milk yield at each lactation.
—duration of each lactation.
—value of loan used to purchase animal.
—value of subsidy on loan.
—value of own resources used in purchase of animal.
—monthly value of purchased feedstuffs.

The daily milk yield was used to calculate the value of milk yielded in toto by the animal, at the price of milk paid to the household by the milk society. The appropriate measure of the household's outlay in purchasing a particular animal is not the purchase price but the sum of the loan and the own resources, which frequently exceeds the purchase price. In addition, at the household level data were collected on the value of manure yielded by the livestock (this proved impossible to allocate between animals except equally), on the calves born to livestock owned, and on the household labour involved in looking after the animals.

The milk society in the wetland village had recently been wound up after two years of operation due to misappropriation of funds by the society's officers. (Sadly this did not make the society unusual: the increase in dormant co-operative societies in the district in the three years from 1981 to 1984 was equivalent to 61 per cent of those operating in 1981). These events left the funding bank with an impression of very poor repayment records by the individual members, many of whom had in fact kept up payments

regularly to the co-operative society. In the current survey all incomes accruing to IRDP animals are treated as benefits to the household, whether or not the household actually received the income due. The reason for this was not to deny the importance of misappropriation in affecting the operation of the IRDP, but to separate the question of misappropriation from the question of the basic quality of livestock investments made under the scheme.

The data described were used to calculate estimates, under various alternative assumptions, of the returns to ownership of milch animals in the study villages. Several difficulties present themselves in making such calculations. First of all, livestock farming is a classic instance of joint production with durable capital, so that allocations of both incomes and costs must be made to various stages of the production process, and there is often no clear or indisputable way to achieve this. Secondly, market valuations of costs and incomes are in some cases inappropriate, requiring imputations. Thirdly, because the survey was a cross-sectional study conducted in effect at a single point in time, the data available necessarily lack some of the detail required for the calculation of internal rates of return. In particular, although there are data on incomes and costs over a three-year period prior to the date of the survey, the exact timing of these flows is in many cases unknown, making appropriate discounting difficult. Accordingly, several alternative variables have been constructed, corresponding to measures of gross and net operating surplus on the ownership of each animal over the three years concerned, and conclusions drawn from these variables will be deemed robust only when the different measures corroborate one another.

The output produced by an adult female in any time period consists not just of milk, but also of manure, and also sometimes of calves and rental services (such as in activities like ploughing[2]). There are also changes in the value of the animal itself which need to be taken into account; if the animal is still in the household's possession at the reference date (not having died or been sold), these changes in value require imputation. The procedure adopted here has been to construct a measure of output and production costs per animal during the three-year reference period, where production is conceived as a one-period process employing labour, feed and capital (in the form of a purchased animal) as inputs, and yielding as joint outputs both the conventional outputs and the older animal. If the animal died during the reference period its imputed value is zero, if it was sold the value was the sale price. For animals still in the household's possession a sale price was imputed based on a regression equation of sale prices. The measures of return to investment are based on various combinations of these recorded and imputed incomes and outlays:

1a) Gross Private Operating Surplus (GPOS) = sale price + value of milk + subsidy − household's outlay.

1b) Gross Social Operating Surplus (GSOS) = sale price + value of milk − household's outlay.

2a) Net Private Operating Surplus (NPOS) = GPOS + value of manure + saleable value + imputed value of calves − cost of purchased feed.

2b) Net Social Operating Surplus (NSOS) = GSOS + value of manure + saleable value + imputed value of calves − cost of purchased feed.

3a) Net Private Surplus (NPS) = NPOS − imputed labour cost.

3b) Net Social Surplus (NSS) = NSOS − imputed labour cost.

Each such measure represents the undiscounted present value at the start of the three-year reference period of some set of incomes and outlays accruing during that period. The first two measures (which differ from each other only in that the first includes and the second excludes any element of subsidy in the purchase of animals) are calculated using magnitudes that are precise, easily ascertainable and do not require imputations or allocation between animals. They represent, in a sense, the gross cash gain on the transaction to date, without including any upkeep costs. However, since 55 per cent of the animals in the sample were still in the household's possession at the date of the survey, the values for these animals do not include sale prices. For this reason, comparisons must be made separately for animals sold and animals still present. Tables 1 and 2 do just that.

Table 1 shows the Gross Private Operating Surplus by village and category of animal, separately for animals present and those no longer owned by the household. It reveals, strikingly, the very poor performance of livestock purchased under the IRDP compared to those purchased privately by individuals. This impression is confirmed even more strongly by the other measures, so the reasons for such a finding will not be discussed in detail at this point. But it is worth pointing out that, despite the presence of subsidies of between 665 and 1250 rupees per animal, the surplus on IRDP animals is either less or only slightly greater than that on privately-purchased animals *even including the value of the subsidy*. Measured as a proportion of the household's outlay the performance is even less impressive, with a GPOS for IRDP animals still present in the wet village of less than 40 per cent of outlay (compared to over 85 per cent average for the village), and a figure for the dry village of just 9 per cent compared to a village average of 12 per cent.

When subsidies are excluded, as in Table 2, the contrast becomes even more clear. IRDP livestock achieve a mean Gross Social Operating Surplus of between 650 and 1200 rupees less than privately purchased buffaloes, and underperform private cattle by more variable amounts. Again these differences will be analysed in more detail below using the more sophisticated measures. At the risk of triviality, however, it should be pointed out that negative values of the GPOS should not be taken in themselves to mean that households are worse off as a result of their purchase of the livestock concerned, since they may still own the animal. There are essentially two possible ways to cope with this difficulty. One is to ignore the value of present livestock, and to conduct all comparative analyses separately for the two groups of present and absent animals. While this has the attractive feature of avoiding possibly contentious imputation, it implicitly assumes that the capital value of the animal to the household is the same for all households (or at least not variable systematically in a way relevant to the analysis). It also prevents even an attempt at answering, for households with cattle still present, the question whether and by how much they have benefited from the IRDP scheme.

Measures 2 and 3 therefore impute to each animal present at the date of the survey a saleable value, on the basis of an equation estimated for the sample of animals that have been sold. The only misgiving occasioned by this procedure is that the fit of the equation is not good.[3] However, it is unclear how much this represents a shortcoming of the data, and how much the fact that livestock sale prices are in themselves highly fluctuating and uncertain, so that the household owning the animal may itself have only limited knowledge of what the animal would fetch. The latter problem is familiar in other contexts, such as in the imputation of wage costs (e g, for the valuation of leisure) to unwaged household members in circumstances where the best wage equation has a poor fit. At all events, this procedure is preferable to assuming all present cattle to be of equal value.

The measures of Net Private and Net Social Operating Surplus also incorporate estimates of the value of manure produced, the cost of purchased feed, and the value of calves (which are, in a sense, among the joint outputs of the process). Average monthly values for the cost of purchased feed were obtained: these values typically differed for cattle that were dry, milking and pregnant, and on the basis of the length of time spent in each of these states a total feed cost for the three years prior to the survey was calculated. The values of manure and of calves are much more rough-and-ready: only a minority of households sold manure, and on the basis of the prices realised by them a value was imputed to those households who used the manure on their own land. As for the value of calves, only their breed and sex were at all significant in explaining the variation in calf prices, so each calf present was imputed the mean realised price for calves of its own breed and sex.

So NPOS and NSOS in a sense represent measures of the private and social value added in livestock ownership—output net of all intermediate inputs and maintenance expenditures, but without deduction of factor payments, to either labour or capital. They do *not* include the value of any 'leakages', such as the payment of bribes or commissions that are sometimes necessary for families to qualify for IRDP loans. Given the estimates and imputations necessary to arrive at such measures, it may be wondered how much they are to be trusted. Each family that had taken out a loan for the purchase of cattle (whether under the IRDP or otherwise) was asked whether it was glad that it had done so (whether it felt better off as a result). If NPOS is an accurate measure of private value added there should be a strong correlation between households' answers to the question, and the value of NPOS for the animal in question. And indeed, Table 3 shows, for the dry village, a simple matrix indicating that the great majority of loans with an NPOS greater than zero were ones with which the household professed itself pleased—and conversely for values less than zero.

In fact, in the wet village where the milk society had broken down, there are reasons for expecting this correlation to be somewhat weaker, for two reasons. The first is that the measure assumes that all loans are repaid in full, whereas the breakdown of the society meant that many loans were written off. Secondly, since the reason for the breakdown was partly the embezzlement of funds by society officials, those whose cattle had been most productive and who had therefore repaid most funds to the society were likely to have suffered disproportionately from the embezzlement of these funds, and therefore to have registered relatively more dissatisfaction for this reason in response to our question. This does not mean that the measure is not useful in the wet village; it merely means that what it measures—namely, the economic benefit to households if all loass are repaid—could not be expected to be the basis for households' responses to questions about their satisfaction with the loan.

As will be seen below, the dry-village correlation with reported satisfaction is even stronger for the measures that take account of differences in households' labour endowments, but for the time being Table 3 suggests that the NPOS and NSOS measures have considerable usefulness. Table 4 shows the value of these measures in the two survey villages for different categories of cattle. The conclusion emerges even more strongly that IRDP cattle have performed relatively badly: even the mean *private* surplus for IRDP animals is lower than for non-IRDP buffaloes in both villages, though the former but not the latter benefit from a substantial element of subsidy. Owing to the high variance within each group, these differences are not statistically significant, but the differences in mean *social* return (excluding subsidy) certainly are. In both villages the mean NSOS is over one thousand rupees lower for IRDP buffaloes than for those purchased privately: in the wet village this difference has a F-value of 8.7 and is significant at less than half of one per cent, while in the dry village the F-value is 10.6 and the significance 0.16 per cent.

Two other features of Table 4 are worthy of attention. First, the mean surplus is higher in the wet than in the dry village, but not by very much (at least for buffaloes). Since there are comparatively many fewer economic opportunities in the dry zone, this lends some support to the view that milch cattle loan schemes are more likely to be successful in dry zone areas, not because they are more profitable absolutely, but because they are more profitable relative to the meagre alternatives and therefore more

TABLE 1: GROSS PRIVATE OPERATING SURPLUS TO MILCH CATTLE OWNERSHIP

necessary. The second point to notice is that the surplus on cattle is lower in the dry zone than might be expected, given their high relative profitability in the wet zone. In fact the figure for the dry zone is almost certainly a significant underestimate of the true value, since it excludes the value of ploughing work performed by the cattle. It is quite common in dry zone farming for small farmers to use cows rather than bullocks for ploughing; although cows are not ideal for ploughing, and although heavy work reduces their milk yield, this involves less risk than either the ownership of bullocks (which yield no income when rains fail) or reliance on hired bullocks in an imperfect and unreliable market for drought power.

The Net Private Operating Surplus is not the ideal measure of the benefit of an animal to the hosuehold, since it ignores the different endowments of labour available to different households. This matters in several ways. First, market wages differ dramatically for different categories of labour. For example, female daily wages in the area were around three rupees per day; those for men were between seven and eight. Second, households differ in the ease with which their members can find alternatives to livestock rearing. Third, there may be economies of scale in caring for livestock, so that households who already own cattle will find the marginal labour cost of extra cattle comparatively low. In order to take account of these factors, all households were asked which members were involved in the care of cattle and for how many hours per day. In addition, households who had taken out loans were asked what these household members had been doing before the loans were taken out, so as to determine whether the loan had drawn them out of alternative employment. Costs were imputed in two ways: first, on the basis of market wages for the labour actually expended, and allocated by division between all cattle in the household in proportion to the length of time those cattle had been owned. These may be called the *full* wage costs. Secondly, for those cattle purchased on loan, these costs were adjusted according to whether the household members concerned had been inactive or in part-time or full-time work prior to the loan. These may be called the *adjusted* wage costs. Unfortunately, the latter procedure was not possible for all cattle: households which had not taken out loans tended to have owned cattle for a considerable time, so that the question "what did you do before you owned cattle" was fairly meaningless. One might, of course, infer from this that for such households the shadow wage for caring for marginal cattle is effectively zero—a conclusion that would even more clearly show the poor performance of IRDP livestock. Since this poor performance is convincingly enough demonstrated by the existing figures, the adjusted wage costs should not be given undue weight.

F=5.56	Significant at 2.1 per cent		

The Net Private and the Net Social Surplus take account of the imputations of full wage costs, and thereby provide a means of estimating the returns to capital (Table 5 illustrates). The average Net Private Surplus for the sample as a whole is 284 rupees, or 21.4 per cent of the average outlay. Since the average time animals are kept is just over two years,[4] this gives an annual return of just over 10 per cent, an uninspiring figure given the very substantial risks involved. The social return is actually negative because of the poor performance of IRDP animals. Excluding these yields a much more attractive figure of 80.3 per cent (though only 37.6 per cent in the dry zone). This discrepancy is almost certainly an exaggeration, given the use of some cattle for ploughing in the dry zone. It is likely that these fairly high returns to capital are indicative of the presense of a degree of credit rationing (plus high informal sector interest rates). But they also without question incorporate a substantial risk premium. The variability of rewards to keeping livestock is so great that only 52 per cent of non—IRDP animals show a positive net private surplus. Less than half of IRDP animals do so. At levels of poverty like these, the effect of losing money on livestock operations can be crippling. At all events, it is evident that livestock under IRDP have to yield strongly positive returns for them to be of any value to poor households. It is equally evident that they have failed to do so.

In the dry zone, the correlation between values of Net Private Surplus and reported satisfaction with loans has been increased, as Table 6 shows. The F-value of the correlation has increased to 14.9, significant at one-thirtieth of one per cent. However, the table also suggests that Net Private Surplus probably underestimates private benefit, since the mean value for those reporting themselves satisfied is under 400 rupees, and the value of NPS, above which the same proportion of loans lie as are reported satisfactory, is -400 rupees. So there are some grounds for thinking that the returns are somewhat healthier than these values would indicate, though not in any way that alters the poor performance of IRDP animals. Indeed, as expected imputing labour costs has further accentuated the poor performance of IRDP livestock. The difference in Net Private Surplus between IRDP and non-IRDP buffaloes is now significant at 7.3 per cent in the wet zone and 2.3 per cent in the dry.[5]

So there seems to be no reasonable doubt that investments in IRDP cattle have performed worse in both survey villages than investments in similar non-IRDP cattle, even when the substantial element of subsidy is taken into account. This poor performance has meant that a minority of families has benefited at all, and a substantial number

will have been positively harmed unless the outstanding loans are to some extent written off. It is now time to consider some of the reasons for this state of affairs. A suggestion that is frequently made is that 'leakages' from the loan advances (in the form of bribes, inflated fees and brokerage charges) mean that an IRDP loan of, say 2,500 rupees yields a much smaller amount of cash to the borrower. In the present sample, there is a degree of truth in this suggestion, but only a small degree. The mean difference between the outlay on loans (the loan amount plus any private resources used by the purchaser) and the actual purchase price of the animal, is 166 rupees in the wet zone and 229 in the dry. These are large amounts for poor families to bear (equivalent to around a month's wages for an agricultural labourer), but they are still small compared to the discrepancies in surplus generated by IRDP and non-IRDP investments. It is true that some leakages may be subsumed under the purchase price (for example, the payment of a broker's fee at the cattle market). But no such leakages can explain more than a small proportion of the discrepancy.

The most important factors appear to be the following:

(1) Customers with IRDP loans pay significantly more for cattle of equivalent quality than do customers purchasing on their own account.

(2) Owners of IRDP cattle spend more on purchased feed.

(3) The labour costs of caring for livestock are higher for IRDP owners, both because IRDP owners typically own smaller numbers of cattle and because they are more likely than others to have to give up alternative work in order to care for them.

Some of the differences in feed cost between IRDP and non-IRDP buffaloes are no doubt due to differences in the length of time owned; but—especially in the dry zone—not all such differences can be so explained. What does seem clear is that buffaloes cost a great deal more to maintain than do cattle. Such feed costs are probably best thought of as a kind of fixed cost that has to be incurred to ensure the survival of the animal—and which therefore is likely to be the more indispensable the more expensive is the animal—rather than a fully variable cost incurred to increase the animal's output (see Table 7).

The greater labour costs of IRDP animals also emerge clearly from the table. The interpretation of 'full wage costs' is relatively straightforward. But as explained above, the 'adjusted wage cost' column needs to be interpreted with care, since it adjusts the imputed wage costs according to the alternative activities in which the labour would be employed, and is a notion that therefore applies only to households that have used loans to begin livestock farming. It represents in a sense the marginal labour cost of livestock farming—and it shows how much greater this is for IRDP cattle than for others. In this case as so often, to him who hath shall be given: it is those families already owning cattle who can most economically manage more of them.

The purchase prices are the hardest items to interpret. On the face of it, they show IRDP recipients have had to pay significantly more for their livestock than other purchasers. By itself, though, this would not matter if the quality of IRDP livestock were correspondingly higher. If the livestock market functioned perfectly, the higher prices paid would be just compensated by the higher quality of the cattle purchased. In fact, the institutional nature of the livestock market in the region of the study very strongly suggests that it is far from perfect. In particular, it is neither a large nor an anonymous market: sellers of livestock are frequently aware whether or not buyers are the recipients of IRDP subsidised loans. They know it so that the buyers' freedom to manoeuvre is limited by the requirement to effect the purchase at a certain date. The buyer cannot therefore credibly threaten to wthdraw from negotiations unless he can find another seller. The markets are small enough for sellers (or usually brokers on their behalf, or alternatively middlemen on their own account) to form coalitions to drive up the price to such buyers. So in addition to the direct leakage of subsidy funds in the form of side payments, there is a further leakage of a kind in the form of price discrimination between buyers with subsidies and buyers without. As the large price differential reported in Table 7 suggests, leakages of this latter kind are typically more significant than those of the direct kind.

In another paper,[6] I have tested and rejected the hypothesis that the higher prices paid by IRDP participants reflect higher livestock quality rather than price discrimination. There is also some weak evidence that IRDP participants may be less well equipped to manage livestock investments than are existing livestock owners, due to economies of scale and complementarities

between livestock and land. While this should not be over-emphasised, it should at least serve as a note of caution against acceptance of the assumption that the poor have a natural comparative advantage in the management of livestock.

III

Conclusions

The evidence of this study suggests that even when subsidies are included, the benefits to households of investing in livestock through the IRDP have been significantly below those to livestock purchased outside the scheme. Depending on the measure used, somewhere between a third and more than a half of IRDP participants in the study villages were actually worse off as a result of their loans (or would have been in the absence of partial write-offs of their dues). This was principally due to higher prices paid by IRDP participants in the livestock markets, prices which were not compensated by higher quality of the animals purchased—in other words, to price discrimination. Undoubtedly this price discrimination was facilitated by the presence of large subsidies. There is also evidence that households lacking land and underemployed household labour were not able to manage livestock investments economically at this small scale of production.

In the circumstances of the villages studied, the IRDP programme would have been considerably more successful if

(1) Fewer loans had been made, but more cattle had been purchased with each loan.

(2) Loans had been directed more carefully towards households with either the *ability* to make profitable use of them (say, through ownership of some land) or the *need* to do so (because of a lack of alternative economic opportunities).

(3) Subsidies had been avoided. There is no evidence that subsidies have any other effect than encouraging demands for side-payments and price discrimination between subsidy recipients and others. In addition, the presence of subsidies makes it harder to distinguish those households that are genuinely able to make productive use of livestock from those that are merely attracted by the subsidies. The latter may have an important claim to assistance, but not necessarily to assistance of this kind.

It is wise to exercise caution before generalising from these results. It may be that the conditions enabling price discrimination on this scale are not found in other parts of India where the cattle markets may typically be much larger and more anonymous in character. It may also be that price discrimination, where it exists, could be significantly alleviated by institutional measures allowing greater flexibility in the conditions of disbursement of loans.[7] Nevertheless, these findings suggest a lesson of general applicability: the undoubted presence of imperfections in formal credit markets should not lead us to think that schemes for the alleviation of poverty can afford to concentrate on these imperfections alone. The imperfect operation of the markets for productive assets can frustrate such efforts. Identifying opportunities for truly productive investment may therefore be as great a challenge as making available the credit to finance them.

Notes

[Research for this study was funded by a grant from ESCOR of the Overseas Development Administration. My thanks are due to them and also to All Souls College, Oxford, where I was Fellow at the time of the study, and who generously gave me leave of absence to undertake the research. The Madras Institute of Development Studies kindly welcomed me as a visiting scholar. All opinions expressed in this paper are strictly my own and should in no way be taken to represent the official views of the Overseas Development Administration or of any academic institution.

Many people have contributed to this research. Gilbert and Vasantha Rodrigo gave companionship and research assistance throughout the field study, and K Kumar and S Iyyampillai each spent several months with us in the field. Ian Alexander gave invaluable programming assistance in the UK. Others whose advice has been important include Venkatesh Athreya, James Copestake, S Guhan, Judith Heyer, V K Ramachandran, Amartya Sen, S Subramanian, Madhura Swaminathan, Douglas Thornton and A Vaidyanathan. And as usual, Isabelle Daudy's support and help have been incalculable. None of the above is to blame for what is contained in this paper.]

1 Fuller details of the study villages and the nature of the survey are given in P Seabright, 'Identifying Investment Opportunities for the Poor', report to the Overseas Development Administration, January 1988.

2 Ploughing is an activity normally performed by bullocks, which were not included in the survey. However, during the survey it was realised that cows are occasionally used for ploughing in this region, in a way that the survey had not systematically inquired into. The output figures here do not include rental income; however, there is no evidence that this is more than a tiny component of income, and even then it occurs only for white cattle. Adult female buffaloes (the subsample on which the hypothesis of price discrimination is tested below) are not used for this purpose.

3 The following equation was estimated:

$$sp = 4.213 + 0.2625\ pp + 0.033\ mlk + 0.2025\ sy + 0.3079\ v - 0.2552\ br - 0.1553\ s \qquad R^2 = 0.344$$

where sp = ln (sale price)
pp = ln (purchase price)
mlk = ln (value of milk)
sy = year of sale (1982=0, 1983-1, etc)
br = dummy for breed (0=buffalo, 1=cow)
v = village dummy (0=wet, 1=dry)

Although other functional forms were attempted, none resulted in significantly better fit, and the logarithmic form was preferred as avoiding heteroskedasticity. For those animals (56 out of 379) for which there was no purchase price because they had been born to other cattle owned, a purchase price equal to the mean for the sample was imputed. In view of the importance of the comparison between IRDP and non-IRDP animals to the results of this paper, an attempt was also made to estimate the equation separately for these two groups. The performance of the two equations was not significantly different, and since the comparison in imputed saleable value between IRDP and non-IRDP was even less favourable to the IRDP group under the latter procedure, the former more cautious method was preferred.

4 Differences in the length of time the animals have been owned do not explain the discrepancies, as the final column of Table indicates. Indeed, the length of time owned was—surprisingly—statistically insignificant in all the output equations estimated below.

5 Reflecting F-values of 3.1 and 5.0. The difference in Net Social Surplus has an F-value of 16.6 in the wet zone and 20.7 in the dry.

6 Likewise, the ease with which the officers of co-operative societies can embezzle funds belonging to the membership would be greatly diminished if the legal structure of co-operative societies gave scope for redress in civil law to those parties with both the means and the interest to seek it, namely the banks. In the case of the society in this study which was wound up, the banks' only contract was with individual borrowers; all their efforts to counteract overdues were therefore directed towards these individuals, in spite of the undisputed evidence of fraud by third parties. This is not to say that such institutional reforms would halt corruption, merely that they would help to make it more difficult.

7 The literature on the IRDP is now very large: J Dreze, 'Social Insecurity in India', discussion paper, London School of Economics, and C Hanumantha Rao and P Rangaswamy, 'Efficiency of Investments in IRDP', *Economic and Political Weekly*, 23, A-69-76 are two recent papers that explicitly address the questions of investment efficiency that are central to the argument here.

An Agenda for Disaster

New Soviet Thinking about the Revolutionary Movement in the Third World

S Akbar Zaidi

The impact of perestroika on the Soviet Union's perception of the third world will lead to a redefinition of the dimensions of working class movements in underdeveloped countries and affect their prospects of revolution. The present paper examines the possible effects of the new Soviet thinking regarding the revolutionary road in underdeveloped countries.

The relatively rapid growth of capitalism in the third world over the past two-odd decades has merely confirmed the Marxist conception of social progress; this process, as well as being natural, has been greatly expedited by the economically more powerful and dynamic capitalist system, there being to serious counterweight to it, above all with the emergence of transnational companies as an effective instrument from promoting capitalism in the third world.

—Alexei Kiva (p 62)[1]

Where the social class structure is immature and social consciousness low, collective forms of property cannot as a rule, play a steadily progressive role in the national economy. On the contrary they are likely to hamper social and economic progress. As regards private capitalist enterprise, its historically progressive role goes beyond providing material prerequisites for socialism. It is in this phase of capitalist development that the basis for bourgeois democracy is laid and a civilian formed. Besides, the proletariat gets schooling in the class struggle, which is slack in state enterprises.[2]

—Alexei Kiva (p 63)

ALEXEI KIVA is the head of the Sector of the Working Class and Communist Movement at the USSR Academy of Sciences, Institute of Oriental Studies and the quotes above are taken from his recent article 'Developing Countries, Socialism, Capitalism' which has been published in the influential *International Affairs* (March 1989). Kiva's article typifies an approach towards the third world which has been developing over the last few years following perestroika in the Soviet Union [see: Kiva 1988; *International Affairs,* July 1988; *International Affairs* December 1988; Kozyvev and Shumikhin 1989].

With the failure of socialism in the third world and with the end of the myth of the non-capitalist path of development and of bypassing capitalism (or of the national democratic revolution or socialist orientation), there has been a growing intellectual lobby, notably in the Soviet Union, which has begun to propagate the theory that to achieve socialism one needs to pass through capitalism, and that there are no alternatives to this route (see Kiva 1988, for an excellent and illuminating critique of socialist orientation). This theory proceeds that to achieve a socialist revolution, it is necessary to go through the process of a bourgeois democratic revolution, and we need to fulfil most bourgeois democratic tasks before we make any attempt to achieve the goal of socialism.

The present Soviet thinking about the development towards socialism especially in the third world, is a complete about turn from what was being said in the past concerning imperialism and revolution. The need to reassess and revaluate their previous thinking, has come about, as they say, due to an evaluation of the third world in the last three decades and to the study of the growth of productive forces in countries which were until recently, considered lackeys of imperialism and strongly vested in the pro-imperlialist camp. The change has also been the result of a much more important process which is still going on, that of perestroika. The new Soviet thinking about every concept, old and new has been affected markedly by the changes brought about (as yet more at an ideological and cultural level, than in the material productive level) by Gorbachev and representatives of the 'new Soviet society'. Although this is not the forum to discuss the pros and cons and effects of perestroika, one thing is clear—that the new Soviet thinking has developed due to the numerous contradictions and inefficiencies in their economic and political structure. One dimension of the economic quagmire of Soviet society and the result of perestroika has been the need to develop and expand trade and economic relations with even bourgeois and repressive states, whether developed or underdeveloped. The reasons for ignoring the class and state structure of these countries result from the appalling state of the Soviet economy, and thus the need to find whatever means possible to ensure that the poor Soviet economy can prosper (see: *International Affairs,* July 1988; *International Affairs,* August 1988; *International Affairs,* December 1988; Kozyvev and Shumikhin 1989). Thus, the economic considerations of the Soviet economy outweigh by far, the ideological dimension of the theory and practice of developed socialism. This impact of perestroika on how the Soviet Union views the third world, will profoundly influence the prospects of revolution in underdeveloped countries and will give a new dimension to the working class and revolutionary movement in these countries. It is the purpose of this essay to explore the potential impact and consequence of the new Soviet thinking regarding the revolutionary road in underdeveloped countries.

Before I proceed with the argument being presented by senior Soviet academicians, let me digress from the new Soviet school somewhat, and attempt to deal with the work of a western Marxist scholar, who in many ways seems to be the intellectual father of the new Soviet thinking regarding the prospects for revolution in the underdeveloped capitalist countries. Although Bill Warren died in 1978, his book published posthumously in 1980 *Imperialism: Pioneer of Capitalism* is a Marxist critique of petty bourgeois thinking regarding the path of development in the third world. Now, ten years later, Soviet scholars dealing with the third world say what Warren said many years ago. Given the very closed and blinkered nature of pre-perestroika Soviet society. It is quite improbable that Soviet scholars would have even heard of Warren, leave alone read him. Almost all Soviet works have ample references to the works of Marx, Engels and Lenin and now more recently to the speeches of Gorbachev, and it is unfortunate that they make very few references to the works of western Marxists and bourgeois scholars. Had they read the seminal work by Warren, their arguments would have found more weight and substance and would have been greatly enriched. Thus the more exhaustive critique on Warren below is also a critique on the new thinking of Soviet academicians with which I also deal directly, but, given the still underdeveloped thinking (both horizontally and vertically) amongst Soviet scholars, in somewhat less comprehensive detail.

At this stage, I need to point out an important aspect of the debate and of my critique. My only interest with theory is how it relates to practice. The topic under discussion deals with a theory being propagated which will have grave consequences for the revolutionary process in the third world. The Soviet Union is considered to be the intellectual leader of the international revolutionary movement, and any theory which gains credence in the institutions of advanced thought and learning in Moscow, is considered the final word for the hundreds of

Communist and revolutionary parties all over the world. We have suffered the consequences of this blind faith in the recent past when the meaningless 'non-capitalist path of development' was dictated to the underdeveloped countries by Moscow under the guise of the 'national democratic revolution'. Before such a mistake is repeated, and taking advantage of the (used and misused) phenomenon and concept of 'perestroika', there is need for abundant debate among all revolutionaries in all quarters of the world, developed and underdeveloped.

Warren and Soviet Theses

Bill Warren is a Marxist, but as I proceed to show, his lack of understanding of Hegel and of dialectical materialism, makes his a literal, vulgar and mechanistic Marxism. But first, to his main thesis.

Essentially, Warren's thesis is very simple. He says that capitalism is more progressive than pre-capitalist formations, and thus should be promoted in the third world. To foster capitalism, Warren believes that at first colonialism, in the 18th to the mid-20th century, and now neo-colonialism or imperialism, played an important progressive role and broke down barriers to capitalist development in the backward colonies and in the newly free countries and thus, the continuing integration with imperialism is a desirable and necessary requirement to promote capitalism and to develop the productive forces. He believes that capitalist development and bourgeois democracy are very closely linked and that bourgeois democracy is an important school for the working class, enabling it to one day become the ruling class. Furthermore, capitalism cannot be bypassed and is the natural prelude to socialism. To elaborate some of the concepts with reference to Warren, it is more appropriate to present some of them in his own words.

> The founders of Marxism .... held that the expansion of capitalism into pre-capitalist areas of the world was desirable and progressive (p 3).

> The unique achievements of capitalism, both cultural and material, must not be overlooked, particularly the fact that capitalism released individual creativity... (p 7).

> There is an important connection between capitalism and parliamentary (bourgeois) democracy; the latter provides the best political environment for the socialist movement and creates conditions that favour a genuine learning process by the working class. In fact, the view that capitalism serves as a bridge to socialism must be upheld (p 7).

> The period since the end of the second world war has witnessed a major surge in capitalist social relations and productive forces in the third world (p 9).

> Direct colonialism, far from having retarded or distorted indigenous capitalist development that might otherwise have occurred, acted as a powerful engine of progressive social change, advancing capitalist development far more rapidly than was conceivable in any other way, both by its destructive effects on pre-capitalist social systems and by its implantation of elements of capitalism. Indeed, although introduced into the third world externally, capitalism has struck deep roots there and developed its own lincreasingly vigorous internal dynamic (p 9).

> The fundamentally progressive moral and cultural character of capitalism cannot be doubted (p 22).

> Bourgeois political democracy would provide the working class the best conditions in which to acquire the cultural depth required to become a ruling class (p 26).

> Capitalism and democracy are, I would agree, linked virtually as Siamese twins (p 28).

> The growth of the institutions of democracy was essential to the growth of the bourgeoisie and vice versa (p 28).

> With the development of capitalism [in Russia] and therefore of the working class, the social base was created for a genuinely socialist revolution: the class that was to provide the direct social lever for the transfer of power and was to consolidate and maintain that power in fierce social struggles (p 34). Lenin certainly never would have considered denouncing the foreign powers and businessmen for their prominent role in the generation of industrial capitalism in Russia, a role that nowadays would be called neo-colonialist and codemned by the liberal left (pp 44-45).

> Marx, Engels and Lenin, who considered capitalism historically far more advanced than any earlier civilisation, logically welcomed its extension to non-capitalist regions, whether by means of direct colonialism (India) or 'neo-colonialism' (Russia) (p 46).

> The underdevelopment fiction maintains that the peoples of the third world have been getting steadily worse off ever since industrial revolution in the west. They have become gradually worse fed, worse housed, more disease-ridden, etc (p 112).

> The issue here is not a moral one; rather, it is a question of what historical perspective to adopt in evaluating the contribution, if any, of colonialism to the progress of human unity and to realisation of human capacities. The retrospective, partial, and discriminatory application of the moral principles of late liberalism to historical periods antedating the flowering of such 'standpoints of guilt' serves to obscure both the 'subjective' character (quite different from most earlier colonialism) and objective effects of modern colonialism (p 128).

> Private foreign investment in the LDCs is economically beneficial irrespective of measures of government control...Lenin attempted to attract foreign investment in the early years of the Soviet republic... (p 176).

> Contrary to widespread populist-liberal opinion, the third world has not been marked by stagnation, relative or absolute, in the post-war period. On the contrary, significant progress in material welfare and the development of the productive forces has been made, in an acceleration of pre-war trends. This fact also runs counter to current Marxist views, which have stressed the alleged impossibility of vigorous national development in the third world within a capitalist framework (p 252).

It was important to present Warren's thoughts in his own words, as they bring out the essence better than any summary or interpretation. Many so-called Marxists would even consider his views anti-Marxist, and most certainly, petty bourgeois liberals would object to his thesis, as many have. His is an incomplete understanding of Marx. It is unfortunate that he died while he was in the process of formulating ideas and strategy related to this theme. In fact, he intended to write a chapter "which was to draw explicit political conclusions for working-class strategy in the struggle for socialism in Africa, Asia and Latin America" (p xi). It is a pity that he did not do so and nor was he able to take part in the debate of his work.

Kiva, writing a decade after Warren, not only has the advantage of living and working in a state based on the teachings of Marx and Lenin. The fact that he heads an important department at the Institute of Oriental Studies, gives him abundant direct access to the revolutionary movement in practice, as well as to a theoretical analysis of it. Again, Kiva's official position at the institute also allows him access to many trends in the revolutionary movement. But it is his official position itself which gives his work and words the authority of opinion and thus, he cannot be given the luxury of irresponsibility. True, these are not the days of Stalinism when there was no such thing as a personal independent opinion, but nevertheless, Kiva's work must exemplify a strand (if not the strand) in the official Soviet view regarding the revolutionary process in the third world (also see some of the sources cited above but for a somewhat different view, see Ivanov 1988, and Lee and Mirsky 1988).

In essence, Kiva and Warren are saying the same thing but with different perspectives. Kiva's first sentence uses the term perestroika to explain the need for a new approach. He proceeds by apologising for his and the official view of Sovietism regarding 'the dying imperialist order'. In the 1960s,

> It [public opinion] rejected capitalism as a system which has bred colonial rule, as an inhuman system incompatible with traditional concepts of social justice, collectivisim and humanism. Capitalism was also rejected because it was believed incapable of assuring backward countries rapid economic growth (p 55).

Some underdeveloped countries which had gained freedom from colonialism preferred socialism, according to Kiva, because their leaders wanted to impose political power on their people and wanted to control a centralised (Stalinist) state structure. For this reason, they were allergic to western democracy and to bourgeois parliamentary government:

> any democratic form of government, whatever its social class substance, was an obstacle to their setting up dictatorial and in many cases totalitarian regimes (p 56).

However, there were major problems with

the mere desire for socialism, and as Kiva says, the material basis for socialism was non-existent.

> Most countries which declared to be committed to socialism lacked both developed industries and a modern proletariat... Mass consciousness was steeped in archaic notions and prejudices, and nearly all the inhabitants of many countries were illiterate. How can the principles of scientific socialism spread or alternative, capitalist forms of economic mangement take root in such conditions without being distorted beyond recognition? (p 56).

Other reasons cited by Kiva include the inappropriate use of Marxist terminology across cultures, where its use in "backward countries often meant something entirely different from what the founders of scientific socialism had in mind" (p 56). The Result:

> The hopes for rapidly ending the economic backwardness by following a non-capitalist road... were dashed. So was our hope that new states of Asia and especially Africa would substantially reinforce world socialism by joining it (p 57).

Kiva concludes his analysis of socialism in the third world by saying that the idea that

> It was considered possible to build socialism virtually regardless of how backward the country concerned was... was evidence of a vulgar approach to social processes (p 58).

And socialism is not feasible in underdeveloped countries because there exists "a backward social class structure of society, primarily the absence of a developed proletariat,.... the predominance of traditional forms of ideology and inability of archaic social consciousness to adopt and assimilate an advanced ideology, Marxism-Leninism" (p 59). After the reasons why socialism cannot triumph in the underdeveloped countries, Kiva goes on to the analysis of 'a backward society and capitalism'.

We are told that if a society is too underdeveloped for socialism, this does not necessarily mean that it is ripe for rapid capitalist development; nevertheless, "capitalism is 'genetically' closer to these societies than socialism" (p 59). The question posed after an analysis of developed capitalism is "what does the situation of developing countries suggest in the present historical context, against the background of today's balance of world forces? Calling a spade a spade, we must admit that the development of capitalist relations in new states is historically progressive for all its drawbacks. Attempts to prevent it where there is no alternative can merely prolong the existing backwardness" (p 61). Not only that, we are told that "to oppose capitalist development when capitalism is on the rise and there is no real alternative to it nor a revolutionary situation would mean adopting a reactionary position" (pp 61-62). For Kiva, "capitalism has shown exceptional vitality in many states... while the majority of socialist-oriented countries are in a state of deep stagnation" (p 62). Thus, the new strategy for the working class and revolutionary movement in underdeveloped countries is defined: bring the capitalism. Although both take different routes, Kiva finally meets Warren.

A Marxist Critique

In this section I will attempt a Marxist critique of the theoretical and especially the political consequences of adopting the Warren/Kiva strategy, which, as I hope to show, is a road which would lead to the suicide and annihilation of the working class and revolutionary movement in most of the third world.

Both Warren and Kiva have overlooked two important tenets of dialectical materialism and thus their theses are inapplicable in the way they would have us believe. Firstly, they fail to see developments and phenomena in their specific historical context, in space and time. In addition, they do not appreciate how things connect with each other and how the development of one affects other factors. These and other criticism of Warren and Kiva need to be elaborated in some detail.

Warren, more than Kiva, suffers from generalising a historical process over time to the present period. For Warren, and to a lesser extent for Kiva, if something—a process or a phenomenon—was good and progressive in the 18th or 19th century, it is still considered good and progressive at the dawn of the 21st century. Capitalism, and even colonialism were progressive in a certain historical context, when in Europe, capitalism was indeed building a proletariat, uniting workers, etc, and colonialism was sweeping away pre-feudal and pre-capitalist economic and social obstacles to progress. But can one still feel the same way about capitalism, either in the developed countries or in the underdeveloped countries, or about imperialism at the dawn of the 21st century? I fear not. Capitalism is a progressive phenomenon, but only up to a point. This progressive nature has been passed long ago in developed countries, and even in many underdeveloped countries (notably Latin America, some far eastern countries, India, Pakistan, Iran, etc, and even in some African countries), capitalism has become the dominant mode of production and has reached out to almost every nook and corner of the country. So, few countries still exist with a dominant pre-capitalist mode, while a handful of others may have pockets of underdeveloped areas which are, nevertheless, vociferously being drawn into the expanding capitalist orbit. So, capitalism has enveloped most of what is called the third world, but is it the same force as it was and as Warren, and to an extnet, Kiva would like it to be, in the 18th century? Certainly not.

The world economy since the beginning of this century and much more so since the second world war has changed dramatically and such grand, sweeping comparisons as Warren and Kiva make with the earlier and middle period of capitalism, are unscientific to say the least. Capitalism conditioned by a dominating imperialism at the dawn of the 21st century bears no resemblance to the earlier European capitalism, even in those areas of the third world which are only just coming into the wider orbit of capitalism. Where capitalism is only just being implanted, the seeds that have been planted are completely different from those of the 18th and 19th centuries. There is no comparison. As weaver has pointed out,

> Integral to Warren's cavalier treatment of the historical record of capitalism in the first and third worlds is his unwillingness to entertain the possibility that capitalism may have changed in very significant ways during the last 150 years (p 105).

Thus, any attempt to show the similarity between a process a couple of centuries ago with a different process today, is meaningless. Only an evaluation of the completely different and new form of capitalism, but with the continuity of history (the present as a historical process), can help us see the present dynamics in the third world.

And what has this capitalism done in the underdeveloped countries since its inception? Most certainly, it has revolutionised society, made productive sectors grow, increased the quality of the working class, and so on. But again, is this an endless process? Does capitalism always remain progressive, destroying pre-capitalist forms, or does a stage in history confront us where capitalism fails to remain a progressive revolutionary force which it may have been in the same country a few decades ago? Latin America, the earliest region of the third world to become capitalist and to be thoroughly integrated into the world capitalist economy, is a good example where capitalist development (other than in a few pockets), no longer plays the progressive role attributed to it.

Imperialism today is again, certainly not what it was in the guise of colonialism a couple of centuries ago. Not only were the colonial/imperial powers at a different stage (both qualitatively and quantitatively) of development than they are now, today, the scientific and technical revolution and militarism have given a completely uncomparable dimension to the form and role of colonialism of the 18th and 19th century. Warren fails to see the effects of imperialism at the dawn of the 21st century, the new type of imperialism, more advanced, more sophisticated, more ruthless. In the discussion below, I will deal in more detail with the political effects of imperialism in underdeveloped countries, but for now it would suffice to reach a conclusion using Warren's logic. If imperialism is such a progressive force, in the sense that it is the most developed and advanced form of capitalism as Warren would like us to believe, and with the help of this imperialism we in the third world can throw away the vestiges of pre-capitalist formations and 'develop' like our fellow human beings in the advanced capitalist countries, then it should follow

that it is in our interest that we should ask the United States and other imperialist powers to take over the third world unfettered, and we should not create any barriers to stop this process. If we follow Warren, we should give our countries to the imperialist powers, maybe, on a contractual rental basis and let them come here and develop our societies, while we wait until the fruit is ripe and drops in our lap. Let them develop the poor countries; this is an easier solution than the attempt to develop, given the numerous constraints, ourselves. And thus, we should not condemn apartheid, for the white settlers are from an advanced mode of production than the native blacks and this white civilisation is far superior to the black South Africans and they are fools when they fight against the white people, for they should accept and appreciate the modern, sophisticated and advanced culture.

Ronaldo Munck has adequately summarised the grave shortcoming in Warren's and Kiva's (to a lesser degree) faith "in capitalism today. Munck says that we must dispense with any unilinear model—whether liberal or Marxist—which expects historical replication in today's third world of what happened in western Europe in the last century" (p 352). Both Kiva and Warren have seen the problems of the third world through Eurocentric glasses and have used problems and concepts of the developed countries and applied them to the underdeveloped countries. They fail to realise that the third world is different from the developed countries at any stage in their history, and thus their faith in capitalism as a necessary and liberating force in the modern age of imperialism disregarding time and space is meaningless. Both have fallen into the trap of "using Marx's works as conclusions rather than as guides for inquiry" (Weaver, p 106).

Both Warren and Kiva seem to be quite obsessed with the growth of productive forces without really considering the many ramifications of the growth of capitalism. For them, it produces a working class, the gravedigger of capitalism. This, of course, is over-simplistic and the development of capitalism has important political repercussions which are discussed in more detail below. Warren and Kiva fail to see that the growth of capitalism also develops other forces which may not be as amicable to the revolution as are the working class. True, the working class does increase as capitalism develops, but so do the defenders of capital, who already have a head start compared to the working class. Furthermore, there is no longer a simplified (18th and 19th century) correlation between capital and labour. The development of capitalist enterprise need not mean a very great increase in the working class. The scientific and technical revolution has to some extent done away with a large potential pool of the working class, and automation, computers and mechanisation have replaced the traditional workforce. And this is more marked in advanced capitalist countries, and they too, when they invest overseas in underdeveloped countries, i e, in the guise of imperialism, have begun to prefer to build automated plants rather than deal with troublesome labour problems. Thus, advanced capitalism overseas does not produce the abundant over thrower of capitalism as Warren and Kiva would have us believe.

This point concerning the defenders of capital leads us into a broader political critique of the Warren/Kiva model and it is their metaphysical (as opposed to holistic) approach which has grave consequences for the working class in the third world. The experience of capitalist development almost everywhere in the third world, with very few exceptions, has, for at least half a century beginning with Latin America, led to oppression and even, as is often the case, to fascism. Both Warren and Kiva naively ignore the political dimensions of the growth of capitalism, and they are content as long as they see the numbers of the working class increase. What matters to them is only one side of the coin.

One can cite numerous examples, ranging from Chile to Iran to the Philippines, where capitalist development (a development which has taken place almost always only due to the integration with, and benevolence of, imperialism) has meant the growth of the productive forces, at the cost of severe repression. This is not a moral issue, for the belief that capitalist development will build a working class which will overthrow the system and usher in socialism is a myth. The development of capitalism brings a form of oppression and repression unknown to classicial capitalism, and is a system which destroys the working class and revolutionary movement, rather than build them for the overthrow of capitalism. The hundreds of thousands murdered by every dictator in Latin America should be proof enough. The murder of over a hundred thousand in Iran and the liquidation of political (even very bourgeois-liberal) opposition in almost all countries where we have experienced the marvels of imperialist-aided capitalist development, speaks volumes for the condition of the working class and revolutionary movement which is mechanistically supposed to bring in socialism as Kiva and Warren believe. Not only that, even simple trade union activity is abrogated when capitalism begins to take root and develop. The development of capitalism and the resulting political system have destroyed the working class and revolutionary movement in most underdeveloped countries. This should also put to rest the myth propagated by both Kiva and Warren that is based on an 18th/19th century thinking and is not applicable today. Kiva: "It is in the phase of capitalist development that the basis for bourgeois democracy is laid and a civilian society formed. Besides, the proletariat gets schooling in the class struggle. . ." (p 63), and Warren: "Capitalism and democracy are, I would argue, linked virtually as Siamese twins" (p 28) and "The growth of the institutions of democracy was essential to the growth of the bourgeoisie and vice versa" (p28). Yes, may be in the 19th century, but today, India is possibly the only exception to a rule of abject terror throughout the third world. Again, Ronaldo Munck:

> In Latin America taken as a whole, and with a broad historical sweep, we can speak of a relative absence of hegemony [of the bourgeois state] in this sense. Civil society is weakly developed and, even worse, its elements often come into contradiction with actually existing bourgeois rule, as with the recent radical role of the Catholic church in Central America. The state is everything, but its very strength and omnipotence shows the unstable basis of bourgeois rule. Consent is replaced by naked terror as the cement of bourgeois society. The 'armed bodies of men' on which the state is based are no longer the ultimate recource for the bourgeoisie but a pre-condition for their day to day survival in many countries (p 359).

Political Tasks Based on Warren and Kiva

The political tasks emanating from Warren and Kiva for revolutionary and working class parties and intellectuals should be very clear. The revolutionary movement, wherever it is and whatever its specific socio-economic, cultural and political conditions (for both Warren and Kiva are masters at generality and avoid any form of specificity), should support capitalist development and the bourgeois democratic revolution. This strategy raises many questions, some of which we deal with below.

In the present stage of world history (i e, where indigenous bourgeoisies are weak, where the imperialist system dictates local productive pattern), is it at all possible to have capitalist development in underdeveloped countries (which given the blueprint by both Kiva and Warren, must necessarily and desirably be imperialist-aided), without the form of oppression that is familiar today? The obvious answer is No. In that case, should the left and working class parties condone this oppression as inevitable, chanting the slogan that the working class is 'being prepared for socialism and will soon take over'? Should intellectuals try and write about the benefits of humane capitalism (a contradiction in terms) or should they also just be patient? If our party supports the bourgeois democratic revolution and bourgeois development, as Warren and Kiva suggest, how are we to work in the working class? Are we supposed to tell them of the 'historical mission' of capitalism and ask the working class not to rebel or come out into the streets for otherwise there will be instability and the local and foreign capitalists won't invest and thus our tasks will remain unfulfilled? Or is it not more progressive, given the theory, to do away with all obstacles and resistance to allow capitalism to really flourish and prosper? In this case we should do away with all trade unions, workers rights and such other troublesome

concepts otherwise the capitalists will flee. Even Kiva's clearly defined task for progressive forces: "working to lend capitalist development a democratic character and resisting the growth of reactionary trends in it instead of combating stronger capitalist relations as such" (p 63), is also a non-progressive step, for as we argue, dramatic capitalist development (the real thing!) is linked with reactionary governments, and if we try to 'democratise' society we are only putting hurdles on the road to freedom. Furthermore, most democratic governments have to answer to the people, and given public pressure have to implement social and popular (unproductive) programmes, thus temporarily slowing down the growth in productivity forces. It may be better for the real gung-ho reactionaries to take over as they never have to answer to the people.

Is bourgeois development possible without imperialism in underdeveloped countries? Probably not. It may need, at least, a substantial boost to get off the ground which only imperialism can provide. But when does imperialism leave once it has established itself? Are imperialist-generated capitalist development and bourgeois democracy reconcilable in the present stage of history? At the end of the 20th century, the answer probably is 'no'. In the countries gaining independence after world war two where there has been imperialist-aided capitalist development such as Iran, South Korea, Taiwan, most Latin America, there has been no semblance of democracy and repression is the norm. Only in some countries recently have we seen the easing of military terror to be replaced by weak, controlled democracies—Pakistan, the Philippines. But is this not what Ronaldo Munck would call the permission "for only brief interludes of democracy with a growing trend towards the militarisation of society" (p 357)? At least Pakistan in the last three decades would seem to fit that pattern.

If the task of revolutionaries is to work for the greater development of capitalism and for bourgeois norms, is it not better to abandon Communist parties and become 'the radical section' of a bourgeois party with a broader popular base? This way, given the present tasks (which obviously do not include an anti-imperialist position for it is with the imperialists that we are going to build our future), we shall support the bourgeois programmes and bring a more aggressive, bolder, refined, advanced and complete capitalism so that we can 'increase the productive forces and do away with pre-capitalist vestiges'. Of course, since we no longer choose to remain anti- imperialist (a position which Warren considers reactionary) we should not be disturbed about the prospects of being further integrated into the world capitalist economy and left to the whims of developments in the developed countries. Also, by liquidating our communist parties, we will not have to bear the burden of history by building an already existing weak bourgeoisie into a stronger one, as the tasks imply.

There are other questions which need an answer. When does the bourgeois democratic revolution stop being progressive? For Warren and Kiva there is no answer, no tomorrow, when the old needs to be replaced by the new. Does India, (probably the only case in the third world of successful capitalist development with bourgeois democracy) need a furthering of capitalism and thus the support of the bourgeoisie by communist and revolutionary forces, or should the revolutionary movement strive towards socialism? When will the conditions be 'ripe'? Will they ever be ripe? Or is Warren's and Kiva's ideal view of the third world, a sort of India? The problem with both the authors is that they fail to appreciate the dynamism of capitalist development which has been experienced in the advanced capitalist countries (although, Kiva does touch on this point, albeit incompletely). If capitalism has failed to become socialism and has shown brilliant resilience in the advanced capitalist nations (a point appreciated by Kiva), why should it not do so in underdeveloped countries? Why will capitalism be transformed here and not be as adaptable and intelligent as in the developed countries? In other words, following Warren's and Kiva's prescription, India may become a third world version of the United States by the middle of the 21st century rather than a socialist state, as capitalism will stretch and adapt *ad infinitum*, while revolutionaries will still be trying to complete the (then new) bourgeois tasks, again, *ad infinitum*.

Conclusions

The purpose of the deliberate rhetorical approach taken above, was done precisely to reveal the many absurd conclusions which emanate from the works of Warren and Kiva. Kiva has correctly rejected the nonsensical 'non-capitalist path of development' and the attempts at socialism in the third world, but has also rebounded with a plea to develop capitalism aggressively aided by imperialism. Warren reaches the same conclusions from a different path. He feels that petty bourgeois liberal social scientists are doing a disservice to the revolution by attempting to intervene in the development of capitalism, and that capitalism is a progressive phenomenon and should be encouraged in the third world, again, aggressively aided by imperialism.

It is true that the form of socialism adopted in most of the third world has led to unmitigated disaster and there has been little progress. But that certainly does not mean that the models of capitalist development as applied in the underdeveloped world are so prosperous and successful that the failure of socialism need be replaced by these models. Both Warren and Kiva have spoken in abstract theoretical terms and have not applied their theory to practice. If instead, they had analysed their theory in light of the past experience in underdeveloped capitalist countries, they may not have reached the conclusions they have.

Marxist theory, especially post-perestroika theory, is at an important historical juncture. Many myths are being broken and dogma is making way for logic, common sense, and most of all, dialectics. The study of the transition to socialism, in underdeveloped countries is an extremely important ideological and political task. The realisation that we have failed in the past is an immense leap forward in the understanding of ourselves and of the future. However, it is important to point out that one cannot jump from one extreme to another as the new Soviet thinking is doing. This is precisely the stage where we need to discuss issues in more detail than has been done in the past, before reaching definitive conclusions which may again lead to disaster. This article is an attempt to keep the debate going and I hope will warrant significant attention so that we can begin to think about new and specific alternative programmes for revolution in different regions and countries of the underdeveloped world.

Notes

[I gratefully acknowledge the comments by Mehreen which have helped improve the quality of the text substantially.]

1 All references and quotes are from Kiva's 1989 article unless otherwise stated. All quotes and references from Warren are from his 1980 book.

2 John Weeks, one of the more thorough and sensible Marxist social scientists, has also unfortunately fallen into the same trap, and he sounds exactly like Warren when he says:

> No Marxist would take issue with defining capitalism as progressive if its expansion tends to break down pre-capitalist formations and in the process generates wage-labour relations. Such a judgment is not an endorsement of the capitalist system of exploitation, but reflects the conclusion that the working class is the agent of the overthrow of capitalism and all forms of exploitation. Judging the expansion of capitalist labour relations as progressive is what distinguishes utopian from scientific socialism. Therefore, the expansion of productive capital in underdeveloped countries is necessarily progressive, since it increases the growth of the proletariat (Weeks 1985-86, p 433).

And again, with respect to the export of capital to underdeveloped areas:

> Using the term 'progressive' in its strict Marxist sense, the conclusion follows that capitalism is progressive in the stage of industry (imperialism), though more than one-half century passed before the progressive tendency clearly emerged (Weeks 1985-86, p 435).

Weeks seems to be echoing the essential thesis of Warren, but there is no reference to any of Warren's articles published since the early 1970s.

DISCUSSION

Poor Health Services: Who Is to Blame?

N H Antia

D BANERJI (*EPW*, May 20, 1989) rightly states that the medical profession in India is in the midst of a profound crisis, a crisis that has percolated deep into most of the medical and health institutions and organisations and that the morale of the personnel seems to have touched a new low; that the symptoms of this malaise is reflected in strikes by physicians, decline in ethical standards, corrupt practices and commodification of medicine which is now becoming a commercial activity. The decline in the standards of the district and rural hospitals and PHCs which serve the rural poor is even greater where physicians drawing non practising allowance blatantly indulge in private practice selling government medicines. That there is a virtual breakdown of the public health system is seen in uncontrolled epidemics outbreaks.

For this he blames the government for permitting the proliferation of substandard medical colleges imparting substandard and irrelevant education to produce an excess of substandard physicians who are then forced to take up jobs in central and state government health services where they are dominated by IAS officers who could not secure sufficient marks to enter a medical college. He states that "time is not far off when the authorities concerned will be impelled to take steps to repair the damage they have inflicted on the medical profession". The solution he suggests lies in rejuvenation of the entire system of education and offering service conditions consistent with educational background and social relevance. He thrusts this responsibility on the political leadership.

At independence the country had, at least in the field of health, a remarkably detailed and farsighted document in the Bhore Committee Report for the development of the health services in a country with a vast and diverse population which was chiefly agrarian and scattered in myriad villages. While almost entirely allopathic oriented and with the key role given to doctors trained in the western system of medicine, importance was nevertheless given to preventive, promotive and basic curative services spread throughout the country in Primary Health Centres where the physician was to be assisted by a large number of paramedical workers. The report also emphasised the importance of involving the people in their health programmes. This was the origin of the Primary Health Care concept which was reiterated three decades later by the WHO in its Health for All strategy. This concept was not only operationally sound if health services had to reach to all the people rather than to a restricted urban elite as in the pre-independence era, but was also economically, socially and culturally a sound strategy utilising paramedical staff who would not only be more readily available and less expensive but who would be more willing to live and work with the villagers from among whom they would be recruited. Some of the members advised the retaining of the licentiate course used for training of the basic doctor. This committee also emphasised "certain primary essentials for healthful living", e g, housing, sanitation, etc. "Further, no lasting improvement of the public health can be achieved without arousing the living interest and enlisting the practical co-operation of the people themselves."

They recommended that "under the conditions existing in the country, medical service should be free to all without distinction and that contribution from those who can afford to pay should be through the channel of general and local taxation". They realised the difficulty of attracting medical practitioners to the countryside and recommended "a whole time salaried service prohibiting private practice to permit the doctor to combine in himself at the periphery, curative and preventive health functions" and that "prohibition of private practice was essential in order to ensure that the poor man in the rural areas received equal attention with his richer neighbour".

Why is it then that our medical profession and health services have reached such a low ebb when the medical profession was given and had accepted the responsibility of developing the post-independence health services based on this excellent model. Why is it that we still continue to train over 13,000 doctors annually in 106 government medical colleges at a cost exceeding Rs 3 lakh each who detest preventive and social medicine and the majority of whom wish to specialise in increasingly abstruse branches of curative medicine more suited for those who migrate to the affluent countries or practise affluent urban hospitals in the private sector? Why are we then surprised that these doctors have refused to go to rural areas till overproduction has eventually forced those who cannot compete in cities to work in the smaller towns and rural areas, and as a last resort even in the PHCs and rural hospitals. Entering the medical colleges with high monetary aspirations and trained in specialised high technology they now have to work without the most elementary facilities even for curative services for which they are chiefly trained and without any theoretical, leave aside practical, knowledge of preventive and promotive health care, of personnel management, or of the socio-economic and cultural factors which determine the health of those who have been placed in their charge.

It is easy to blame the politicians for overproducing doctors, which is certainly true of late for they have realised the potential for easy money in opening private medical colleges, especially before elect. ns, under the facile argument of providing doctors for rural areas. But it was the medical profession itself who after independence was responsible for advocating the increase in medical colleges at government expense and devising training based on the medical education imparted in the UK and the US which was more in keeping with their own aspirations to emigrate or undertake lucrative curative practice among the more affluent members of our own society rather than serve the needs of our people at large. The intense desire of the doctors and the rest of the elite to get their sons and daughters into such colleges demonstrates the lucrative nature of medical practice. Trained at public expense, 70 per cent eventually end up in the private sector. Needless to say in this they have the support and encouragement of the rich and influential sections of our society including politicians, who see in such education a highly subsidised form of training for their offspring who will in turn provide a type of medical service in keeping with their own western aspirations. It is the needs of this relatively small segment of our population that continues to dictate the nature of our entire medical education even though overproduction has driven a large number to serve the entirely different needs of the second and third deciles in the smaller towns and rural areas, leave aside of the rural poor.

The Medical Council of India steeped in orthodoxy has had neither the vision, ability nor desire to devise a curriculum to suit the needs of our country leave aside resist the pressures for the registration of substandard colleges which are now proliferating like mushrooms in the private sector. This council like the rest of the medical profession has opposed every move to produce a 'basic

doctor' as recommended by the Bhore Committee and their answer to the failure of the system seems to lie in increasing the content and duration of the curriculum and suggest schemes like Rural Internship and Reorientation of Medical Education (ROME) which were doomed to failure even before they commenced. While giving lip sympathy to preventive and social medicine, the council has done little to raise its status. It has also totally failed to grasp the significance of socio-economic, cultural and political factors as visualised by the Bhore Committee which is reflected in the total absence of subjects like social science, health economics, anthropology or the humanities in our entire medical education. So inappropriate is the education that has been devised and imparted that those who enter with the highest marks emerge after five and a half years as glorified technicians (certainly not as scientists) who pride themselves in their blinkered specialised knowledge but who know little about life and even less of the society to which they belong. Their training is in western-devised expensive so-called high technology of the diseases of the affluent few rather than the far more cheaper and far more relevant care of communicable diseases which are the major killers or maimers of our people today.

It is not surprising that their classmates who failed to secure the necessary high marks and went to the IAS (Indian Administrative Service) where they were provided with the broad education required to fulfil their general administrative duties are able to see the country, the people and their problems as a whole; even in the field of health they can observe it in the broader concept of the Bhore Committee and hence in a more wholesome manner than what is visualised by the medical profession itself.

Banerji thinks it is unfortunate that a junior IAS officer writes the confidential reports of district chief medical officer and suggests that the much respected cadre of the all India Medical Service (IMS) should be revived. It is doubtful that the mere formation of such a cadre will enable the medical profession to enhance its status to that of its pre-independence counterparts which comprised not only able administrators who had a firm grasp of epidemiology for controlling communicable diseases, at least in the cantonments for ensuring the health of their civilian and military compatriots; skills which are virtually non existent in their present day counterparts. While the IMS commanded district hospitals they were not required to staff rural health centres like our present day doctors are and had trained medical licentiates to work under them to undertake common curative and preventive function requiring lower levels of medical expertise. These licentiates unlike the present day MBBS doctor had limited aspirations in keeping with their modest but more appropriate training for the tasks to be performed at their level and hence were more like the basic doctor envisaged by the Bhore Committee. Our medical profession quickly eliminated this 'basic doctor' who they saw as a competitor; yet they have been unable to replace his functions despite their far better and more expensive training. While most of the PHCs were unable to attract doctors a couple of decades ago, they now compete for these posts as a result of overproduction. Yet, bar exceptions, they comprise chiefly of those who have failed to establish themselves in private practice.

It is not possible to understand the present crisis in the medical profession without appreciating the overriding influence of the private sector at every stage. Of the estimated three lakhs of allopathic doctors, over 70 per cent are at present working in the private sector and of these 80 per cent are in the urban areas while 75 per cent of our population is rural. The reason for medicine being the students' first choice is not because of a sense of service to the people and especially the underprivileged but because it ensures a lucrative practice with minimal risk and high social status. Hence the rush for admissions, payment of capitation fees, opening of private medical colleges for those who cannot get into the highly subsidised government ones. The private sector also determines the values of the students and of their interest in the latest specialised technology while ignoring the basic preventive, social and rehabilitative aspects and reducing rural internship to an obligatory farce.

These are also the values of the majority of the teachers in the medical colleges who despite enjoying a better status and higher salary than their non-clinical counterparts are forever seeking to opt out to the private sector. This together with the rapid proliferation of medical colleges has led to further deterioration in the quality of medical education. Since high technology and specialisation is the money spinner in the private sector which sets the 'latest' trend, medical colleges follow suit. There is not a single general practitioner in any of our medical colleges though the majority who qualify will have to undertake general practice whether in the private sector or in the PHC. While the politician can be blamed for making money out of medical colleges, the real blame for the type and quality of medical education must rest squarely on the shoulders of the medical profession.

The total disinterest of the profession in the plight of the poor was clearly demonstrated by the Lentin Commission; not a single doctor raised his voice during this public outcry, indicating the utter callousness and lack of concern when the consequences of their actions resulted in the deaths of their patients who were chiefly the poor. If this can happen in a premier teaching institution like the J J Hospital, one can imagine the conditions at the PHCs and the rural and district hospitals. That the conditions at this hospital has not changed a bit even after this damning enquiry and that the doctors continue to accept the state of affairs without even a whimper against the pharmaceutical industry, the administration and the politicians who were indicted in this report, leave aside their own colleagues, indicates the depth of despair and degradation which has overcome this profession. Steeped in irrelevance with monetary gain as its major motive and having abjured the immense job satisfaction which their profession can provide, a profession which once commanded the respect and love of the people is now being increasingly seen as a necessary evil to be endured. Having lost its moral and ethical stature, the profession can hardly be expected to stand up to the pressures of the IAS or even the corrupt politicans.

Maximising of monetary gain and overproduction of doctors has invariably led to corrupt practices like fee splitting, giving of unnecessary medicines and injections. The search for monetary gain has also led to the deliberate mystification of medicine. Patients are encouraged to seek the services of the doctor for every imagined ill and accept expensive and unnecessary investigations and therapies. While the poor fled from the hospitals for fear of injections of penicillin in the late forties, they have now been hooked on to them through professional salesmanship.

Despite the fact that the MBBS doctor was not willing to work in rural areas and had neither the training, skills nor the ability to provide leadership to the PHC team the profession did not see it necessary to train a new cadre of basic doctor and sufficient nurses or paramedicals leave aside village health workers though the experience of China had demonstrated that these were the key to the universalisation of health care. This dog-in-the-manger attitude which prevented the spread of services to rural India and the control of communicable diseases had eventually to be reversed despite the resistance of the profession who opposed the delegation of duties to paramedical workers and had no hesitation in condemning the Village Health Workers as institutionalised quackery. The task of evolving the rural services in the public sector was therefore undertaken chiefly by the IAS as a result of failure of the medical profession as a whole to do so. Even those few of the profession trained in public health who helped in the development of this type of health care were seldom given the respect or prestige that was reserved for the clinician who dealt with individual patients.

The profession has to first put its house in order if it wishes to emerge from its present crisis. We agree that they are a part of a society in which those who can exploit are given the licence to do so. In such a situation, the medical profession has a unique choice; they can either use medicine as one of the most powerful tools for exploitation in the market economy where consumer resistance is at its lowest or seek job satisfaction which no other profession or trade can provide especially while serving the disadvantaged. The answer surely lies in striking a balance between monetary gain and job satisfaction which may almost mean 'having the cake and eating it too'. This will require a radical change not only in medical education and practice but even more in values which may have to depart from those accepted by the segment of the society to which they unfortunately belong. No amount of blaming the arrogant bureaucrat or corrupt politician can help.

NOTICE

It is hereby notified for the information of the public that LIPTON INDIA LIMITED proposes to give to the Central Government in the Department of Company Affairs, New Delhi, a notice under Sub-section (1) of Sec. 21 of the Monopolies and Restrictive Trade Practices Act, 1969, for substantial expansion of their undertaking. Brief particulars of the proposal are as under:-

1. Name and address of the owner undertaking	:	LIPTON INDIA LIMITED P-44, Hide Road, Calcutta 700 088	
2. Capital structure of the owner organisation	:	Authorised Share Capital	- Rs. 2500 lakhs
		Subscribed & Paid up Share Capital	Rs. 1575 lakhs
3. Location of the unit or division to be expanded	:	Etah Dairy, Etah (U.P.)	
4. In case the expansion relates to the production, storage, supply, distribution, marketing or control of goods, indicate	:		
(i) Name of goods		Milk Products	
(ii) Licensed capacity/turnover before expansion		2621 M.T.	
(iii) Expansion proposed		3801 M.T.	
5. In case the expansion relates to any service, state the extent of expansion in terms of usual measures, such as value, turnover, income etc.	:	Not applicable	
6. Cost of the project	:	Rs. 13.18 crores	
7. Scheme of finance indicating the amounts to be raised from each source	:	Internal accruals	

Any person interested in the matter may make a representation in quadruplicate to the Secretary, Department of Company Affairs, Government of India, Shastri Bhawan, New Delhi, within 14 days from the date of publication of this notice, intimating his views on the proposal and indicating the nature of his interest therein.

Dated this 23rd day of September, 1989

O.P. AGARWAL
COMPANY SECRETARY
LIPTON INDIA LIMITED
P-44 HIDE ROAD
CALCUTTA

A PACKAGE OF INTEGRATED DEVELOPMENT AND WELFARE FOR TRIBALS (ADIVASIS) IN GUJARAT

The first Tribal (Adivasi) Chief Minister of Gujarat, Shri Amarsinh Chaudhary has entered the Fifth year of his steawardship on July 6, 1989. During the past period of four years his Government has, inter alia, initiated a multi-pronged package for the progress, prosperity and integrated development of Tribals (Adivasis) and their areas in the State. Some such highlights are :

EDUCATION :

- Till March, 1988, in Adivasi areas of the State as many as 6,951 Primary Schools, 448 Secondary Schools and 16 Colleges besides 339 Higher Secondary Schools, 263 Ashram Shalas and 55 basic Ashram Shalas were imparting education at various stages to students. In 12 Industrial Training Institutes (ITIs) as many as 2,352 seats are earmarked for Adivasi students. In the Engineeering and Technical institutions of the State, 14 percent seats are reserved for them.
- 609 Hostels, 438 Balvadis and 31 Government Hostels are functioning through grant-in-aid for the benefit of Adivasi students.
- 15.31 lakh Aidvasi students (boys and girls) are studing in standards 1 to 12 in the State.
- During 1988-89, five new residential schools have been opened for Adivasi students. Thus, in all 16 residential schools are running in the State providing educational facilities to Adivasi students.
- Under 'Integrated Child Development thr-ough nutrition' scheme, pupils of 5,675 Aanganwadis located in Adivasi areas are provided wholesome food besides providing them educational and medical facilities.
- 55 Balwadis are running under budgetary provisions where students are provided slates, pens, note-books and uniforms.
- Guardians of students are provided with foodgrains as a measure of incentives for sending their wards to schools.

SOCIAL

- 22 Community Health Centres, 149 Primary Health Centres, 1,632 Sub-Centres, 12 Mobile Dispensaries, 5 Ayurvedic Hospitals, 102 Ayurvedic Dispensaries and 5 Leprosy Control Centres are serving Tribal areas of the State.
- A multi-purpose Insurance Scheme has been started for the benefit of tribals which covers losses to their houses, property, accidents and expenses incurred during their treatment of diseases like T.B. Cancer and Leprosy.
- 202 villages have been declared as Chief Minister's Adopted Villages where minimum need programme is being implemented on priority basis with a view to eradicate poverty of their people.

"Providing a condusive and welfare infrastructure for the integrated and all-out development of Tribals (Adivasis) and their areas has been the Prime Plank of Planning in Gujarat. Let us achieve this cherished goal through our concerted efforts."

— Amarsinh Chaudhary
Chief Minister, Gujarat State
